Dr. Washington Gladden, perhaps the most famous and most widely known of ministers, always spoke encouragingly of, and for our race. Although a cold, calculating, analytical student, he never designedly erected a single bar to race advancement; he rather pulled down bars which hedged it in.

Benjamin R. Tillman, perhaps as superficial a man as ever represented a sovereign state in the United States Senate, always spoke discouragingly of, and for the race—never opened his mouth to discuss the race but he denounced it in bitterest terms, merely for cheap notoriety, and to satisfy and promote his political ambitions. He piled high the very bars which Dr. Gladden would have leveled down.

When Death paused at the bedside of Dr. Gladden to seal lips which had never uttered a single hurtful word against our race, the smile which covered his visage told how sweet to him had been the satisfaction of living a life of helpfulness to ALL mankind, and when life had left that body—weighed down with eighty-two years—a voice must have murmured: "Well done, My good and faithful servant"—and a suffering race wept o'er his parting.

When Death paused at the bedside of Benjamin R. Tillman to forever silence the tongue which had for years, without reason—without cause—assailed our race from the lakes to the gulf; which had espoused legislation designed to turn back the hands on the clock for us, there was NOT A SINGLE moist eye in any of the three million Colored homes in this broad land. On the contrary, every Colored person—when Senator Tillman's death was announced—believed, more than ever, that God does answer prayers.

Because of his goodness of heart; his calm, long, helpful life; recognizing men for their worth and merit, despite the color of their skin, and believing justice had been designed as a legacy for ALL MEN, the late Dr. Washington Gladden was the antithesis of Benjamin R. Tillman.

Because in his heart there was no place—no sympathy for such as whom God had created with darker skin; because he used his position and prestige to dethrone justice for a race which had earned it, by faithful allegiance to country and state; by fighting for it on an hundred battle fields, Benjamin R. Tillman, was the antithesis of Dr. Washington Gladden.

For the one for whom we have tears, and for the one for whom we HAVE NO TEARS to shed, we can, at least say Rest in Peace—God's will be done.

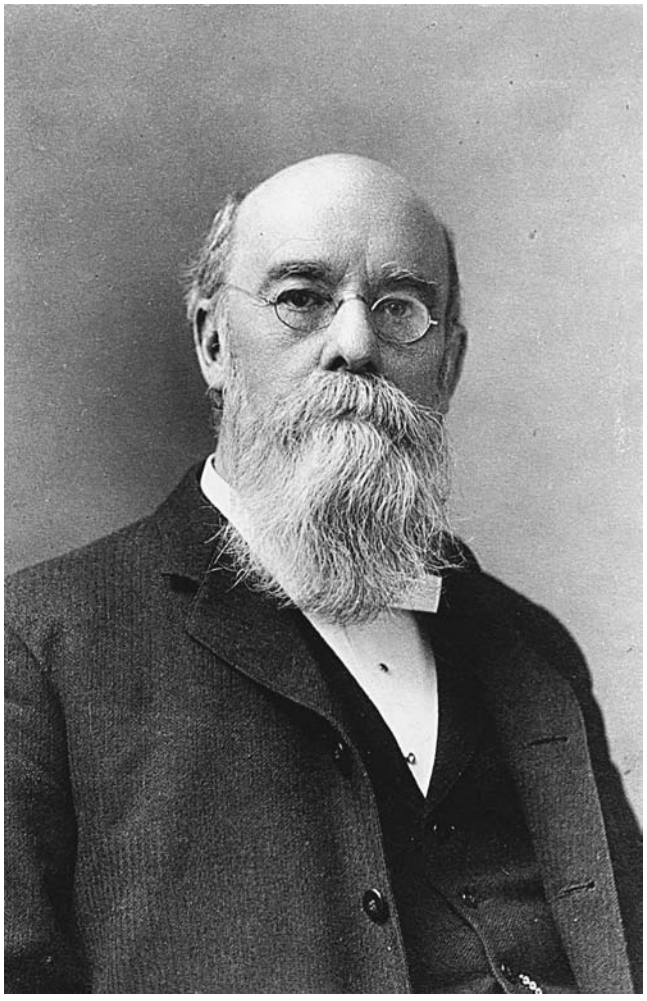
to Gladden that it was easier to bargain with the union at the table than with a mob at the picket lines.

Gladden first made a name for himself with his controversial book, *Being a Christian: What It Means and How to Begin* (1876), and eventually published over three dozen books that helped awaken the American Protestant social conscience. His widely read books dealt with New Theology, but it was his theology of social action that brought him the title of "the father of the American Social Gospel." His was a pragmatic, activist approach to Christianity. He demanded that the churches concern themselves with social injustice and that they help bring the economic features of American life under the laws of God's kingdom by example and by advocacy.

Gladden declared that it was the duty of a Christian to love his neighbor as himself, that society must be reformed along Christian lines, and that this was as important as saving individual souls. He even sought equality for blacks. He took the workingmen's view and argued on their behalf while he urged them to seek unity in Christianity. He rejected socialism as well as laissez-faire economics and declared that workers had the right to collective bargaining and to organize and strike. Gladden's criticism of the free enterprise system sharpened over the years. Although he never became a Socialist, he advocated municipal ownership of public utilities and cooperative management of many industries along with other economic reforms.

Josiah Strong, another follower of Bushnell, provided much of the revivalist and organizing spirit of the movement. Strong regarded the new industrial city as the major crisis for the nation and the church. He spelled out his concerns in the most influential book of the movement, *Our Country: Its Possible Future and Its Present Crisis* (1885). It made him a national figure along with his work with the Interdenominational Congress and as general secretary of the Evangelical Alliance. Both organizations gave him an opportunity to push his agenda of interchurch action as a response to economic conditions and to take the Social Gospel movement national in its scope. His use of social research and public education on social issues served the movement well. However, his anti-Catholic stance and his espousal of American imperialism, both of which had wide support, also influenced the movement. Both of these issues—the establishment of national organizations and a firm belief in Anglo-Saxon superiority—paralleled those of the political Progressives.

Walter Rauschenbusch, a Baptist minister who served in New York City's infamous neighborhood known as Hell's Kitchen for eleven years until 1897 before becoming a faculty member of the Rochester Theological Seminary, embraced the Social Gospel immediately and became its most articulate and popular spokesman in America. He supported Henry George's mayoral campaign in 1886, and worked with Jacob Riis for playgrounds and better housing for immigrants. He emerged as a leading spokesman with the publication of *Christianity and the Social Crisis* in 1907. It laid out the entire Social Gospel in seven short chapters. He dealt with pragmatic solutions and reforms for the capitalist system and discussed his long-held vision for the Kingdom of God on earth. His



Father of the American Social Gospel movement, Washington Gladden preached a pragmatic, activist, and socially conscious approach to Christianity. He supported workers' right to form unions, and he urged fellow ministers to fight for social justice, racial equality, and economic reform. *(Brown Brothers)*

beliefs survived the tumult and chaos caused by World War I in part because it did not dwell on utopian outcomes. Instead, he shifted his focus from the Kingdom of God to the "Kingdom of Evil" to help explain the cataclysmic war then raging in Europe. In *A Theology for the Social Gospel* (1917), written during World War I, he blamed the war not on Germany exclusively but on the lust for power and money by all colonial powers. He called for a democratic cooperative society to be achieved by nonviolent means.

Besides seminaries and pulpits, the social sciences produced its share of Social Gospel supporters and writers as well as activists. Richard Ely, an economist, and Albion W. Small, a sociologist, were the social science counterparts to Rauschenbusch and Gladden. Both men had a comprehensive understanding of social science and exhibited an intense concern for its philosophical background and its ethical implications. They and other social scientists asked the empirical questions necessary to challenge the status quo and support reform legislation. Each infused his work and teachings with the notion that Christian ethics should be applied to answering social questions. Other social scientists and middle-class reformers shared this approach and applied it in various ways and places, like in the settlement house movement, for example.

What the Social Gospel Accomplished

The academic lectern and the ecclesiastic pulpit focused all of this energy and thought on overcoming an assumed alienation of the working class from Protestant churches. Washington Gladden noted that only one-tenth of his congregation was from the working class, but the census reported that nearly one-fourth of the population were wage earners. He and others assumed that meant the churches had failed to reach them and that an active interest in their plight might bring them into the fold. But middle-class Protestants overlooked one basic truth: the working class simply did not belong to middle-class churches. They ignored the existence of a parallel working-class social Christianity movement underway at the same time as the more widely known Social Gospel movement. In fact, labor periodicals used much of the same imagery, rhetoric, and motivation for supporting union causes and labor's discontent. The effort to lure workers into middle-class churches by showing concern and sympathy largely failed because it usually did not have a direct impact on their lives. It also failed to win over many urban immigrants because they were predominantly Catholic and it proposed few lasting solutions to urban problems.

The movement also did little to alleviate the dire situation faced by minorities, including Native Americans, Asians, and African Americans. Many believed minorities to be inferior and incapable of self-government. Women's suffrage faced the same condescending attitude. The typical Victorian family served as the model for the organization of society, even though this denied women many opportunities. Most of the movement's leaders did not involve themselves in the suffrage movement, and some, including Rauschenbusch, opposed suffrage completely.

What the Social Gospel movement did succeed in doing is to provide the political Progressive movement and the Progressive Party itself with ideas for reform, organizational models, national focus, and missionary zeal. The Progressives adopted ideas first embraced by ministers like Washington Gladden, including demands by unions for an eight-hour workday and Socialist ideas such as municipal ownership of public utilities. Without the exposure to Socialist ideas and the problems faced by wage earners, immigrants, and urban dwellers, the Progressive movement would not have been much of a national movement at all.

In the end, the Social Gospel movement had mixed results. It attracted a number of followers and helped liberalize organized religion from its doctrinaire past. It also linked Christianity with progressivism. But it largely failed those it intended to help—those in the inner city and the working class.

Missionary Movements

The American mission movement from the early 1800s through World War II, carried out by the mainline evangelistic Protestant churches, had its roots in colonial New England and preached a mission of Christ and culture: to spread the word of God according to Protestant Christian theology as well as an Anglo-American culture of democracy, efficiency, and technology to the far corners of the earth. Indeed, American national identity has historically been grounded in a faith in America's manifest destiny to establish a civil and moral society so exceptionally favored by God that it would serve as an archetype for all other nations of the world to emulate.

In 1630, Puritan founding father John Winthrop inspired the Massachusetts Bay colonists with the vision that they were creating "a city upon the hill" without precedent on earth, but that nevertheless would become a beacon guiding all humanity. His fellow Anglo-American Puritan missionaries, most notably John Eliot, active from the 1640s to the 1680s, first spread their religious beliefs as well as their model for "civilized society," among the Native American populations they encountered on the North Atlantic coastline, establishing praying towns to convert the natives to a way of life, as well as a way of worship. Thus, they set the pattern for Anglo-American Protestant Christian missionizing, adapted from the Spanish, Portuguese, and French Catholic missionaries and colonizers who preceded them into the "new" worlds outside Europe. The Anglo-American tendency to denigrate the "heathen," "barbaric," "child-like," and "savage" non-European Protestant cultures they encountered, however, was greater in degree than their European Catholic counterparts and increased as Anglo-American settlers pushed westward into the North American continent and, by the early 1800s, beyond the continental borders.

Although mission theorists and missionaries in the field may have debated whether "civilization" (i.e., the American social, political, and economic model) should accompany evangelization (proclaiming forgiveness of universal sin and salvation through Christ to all confessed believers), in practice American missionaries found them linked in intricate and seemingly unavoidable ways. "Christian obligation and American obligation," William R. Hutchinson in *Errand to the World: Protestant Thought and Foreign Missions* (1987) has explained, "were fundamentally harmonious."

Links to American Global Expansion

Outside America's borders, this potent blend of national and Christian identity has led to stereotyping of all Americans as missionaries, crusaders, and cultural imperialists, who assume that progressive culture flows outward only from western Christian civilizations. With American continental expansion complete and industrialization of the economy achieved through technological advances borrowed from England and improved upon with American ingenuity, a more energetic global expansion agenda dominated national policy by the late 1800s and the United States staked its claim to world power status. Territorial acquisitions achieved through purchase, treaty, or war transformed America's self-image as well as how Americans thought about other cultures and peoples.

The idea that America's nineteenth-century experience could serve as a "template" for other less developed, less fortunate peoples, Michael Adas has elucidated in "From Settler Colony to Global Hegemon," led, at the turn of the century to even greater intervention in the outside world, further denigration of other cultures, and a firm conviction that other cultures would welcome American values and institutions. Misapplications of Charles Darwin's biological evolutionary theory to the social realm led Anglo-Americans to believe that people who failed to progress technologically and politically as Western

European and American societies had progressed (and who failed to believe in the Christian God) were destined to disappear or be absorbed into the western world order.

Yet among the many varieties of nineteenth- and twentieth-century American expansionists, those relative few who formally adopted the American Protestant missionary mantle felt most keenly and urgently their Christian and American obligations to create God's Kingdom on earth. Of these few, numbering at the zenith of the mainline Protestant Mission movement in the early 1920s, only some 13,000, embraced in the most literal sense Christ's biblical instruction to "go and make disciples of all nations" (Matthew 28: 18–20). And while the American missionary movement can certainly be viewed as the religious arm of a global movement of western, Anglo-American expansion, the missionaries' motives and influence on the cultures they encountered were complex and ambiguous. To a greater degree than most Anglo-American military, diplomats, or businessmen, missionaries interacted with native cultures in intimate ways. Missionaries became "cultural brokers [mediating] between their home societies and the peoples among whom they worked," according to Charles R. Taber in *The World Is Too Much with Us: "Culture" in Modern Protestant Missions* (1991). In some instances, noted Dana L. Robert in *American Women in Mission: A Social History of Their Thought and Practice* (1996), true cultural collaborations between American missionaries and native peoples "fundamentally changed Christian identity," making Christian identity among the newly converted at the same time less American or western, more culturally specific, and more universally relevant.

Gendered Aspects of the Mission Enterprise

Men in American Mission

The American missionary movement involved men and women in distinctly gendered ways. Male missionaries served first and foremost as evangelical ordained Protestant ministers or lay preachers and secondarily as medical doctors, teachers, and social and industrial reformers. Male clergy and laymen ran the interdenominational American Board of Commissioners for Foreign Missions as well as the denominational Protestant mission boards and determined which fields would be open to the American mission enterprise and who would be sent forth as Christian agents. Male missionaries brought the rhetoric of global conquest to their evangelistic endeavors, proclaiming their goal: "evangelization of the world in this generation" by the 1880s.

John R. Mott, at the forefront of the American missionary movement in its heyday, met regularly with western diplomats and heads of state. And it was Baptist layman John D. Rockefeller, Jr., who, in 1930, launched an interdenominational inquiry into the historic record of the mainline Protestant missions to India, Burma, China, and Japan, and proposed new directions in mission policy based on the nearly two-year-long field investigation. Advancing a decidedly liberal Protestant view, the "Laymen's Inquiry," published as *Re-Thinking Missions* in 1932, proposed that the (male) missionaries' role was to act as ambassadors for Christianity rather than soldiers or salesmen, expert at addressing the social needs of the native populations. Throughout the duration of the American mission movement, men held the visible leadership and policymaking positions in spite of the fact that, by 1910, women accounted for 55 percent of the mission force.

Women in American Missions

Female missionaries served first as mission wives and models of pious Christian homemakers. Later, after the first generation of mostly married women in the mission field, single women missionaries served foremost as teachers, social reformers, doctors, and nurses. All missionaries felt called to the mission field to "save" heathen souls for Christ. But female and male missionaries alike believed that female missionaries had a special call to uplift the lives of their "degraded" nonwestern "sisters" living in non-Christian societies where women's oppression was judged to be more cruel and intense that that of men. Perhaps because their own Protestant churches denied them a formal ministerial role and relegated them to a separate, auxiliary role on church mission boards, female missionaries devised a mission theology that was active, practical, and holistic, with set goals to meet the native societies' material, intellectual, and spiritual needs. First promoted energetically by Mary Lyon at her Mount Holyoke Female Seminary in the mid-1800s, what became known as the "Woman's Work for Woman" missiology after the American Civil War was grounded in the belief that higher education was necessary for American women to become fully useful, well-trained teachers and thereby play a larger role in the public realm of society—even if that public realm was overseas. The profession of missionary became

particularly attractive to many American women in the late nineteenth and early twentieth centuries because it provided one of the few socially accepted professional avenues for the increasing number of college-educated, single women.

American women missionaries, while undeniably colonial women who shared a crusading sense of cultural superiority with their male counterparts, nonetheless brought education and awareness of national and global, social, and political issues to the lives of colonized women and children that fostered distinctly subversive, anti-imperialist consequences. Dana L. Roberts has asserted that the American women's mission movement, intentionally or not, "with its goals of evangelizing and emancipating non-Christian peoples through education . . . gave non-western women the tools with which to shape their own destinies." After World War I, shaken as male missionaries were by the disillusioning specter of Christian nations at war, the Anglo-American women's mission movement adopted a new foundational watchword, "World Friendship," which displayed more cultural sensitivity and a conviction that nonwestern peoples would forge their own paths to Christianity. Within the women's realm of mission work, native women assumed leadership positions in schools, churches, and other religious organizations. Anglo-American women retreated to advisory roles in the mission fields, continuing to serve only at the specific request of native women and devoting their energies to promoting peace and internationalism in an increasingly violent and nationalistic era. Failing to avert World War II, the American women's mission movement as it had developed within the mainline Protestant churches, declined in number, and ceded its predominant position to faith-based evangelicals and Roman Catholic missions in traditional nonwestern mission fields as well as in European nations, and, in the 1990s, in states that had been part of the Soviet Union.

Overseas Mission 1870–1930

By the late nineteenth century, the emergence of the Social Gospel within American Protestant churches demanded Christian ministry to all human needs, physical and intellectual as well as spiritual, in order to perfect human society on earth. The rise of an expansionist ethos in mainstream American politics accompanied this growing adherence to the tenets of the Social Gospel among the middle class. These two concurrent developments fueled an outward-looking reforming zeal within mainline Protestant church congregations, and the American mission movement flourished between 1870 and 1930. During these years, mainline Protestant theology shifted from a premillennial focus whereby American Protestant Christians sought to prepare the world for the imminent return of Christ to a postmillennial vision, in which American Protestants believed they were extending the Kingdom of God on earth by spreading Christian values through American cultural and political institutions. Firm belief in America's special covenant with God inspired a new wave of missionaries to go forth to nonwestern nations in order to advance Christian (and American) civilization. From 1860 to 1890, the number of Protestant missionary societies sending Christian emissaries into the foreign fields increased from sixteen to ninety.

The Youthful Character of the New Mission Era

This more confident, energetic, and self-conscious national pride that permeated the American mission movement in these decades attracted young college students in increasingly larger numbers to the foreign fields. The movement was inspired by mission promoters like the Reverend Arthur T. Pierson who edited the *Missionary Review of the World* journal in 1886 and who insisted that new technological and political advances in American civilization had created the most opportune moment for expansion in Christian history. Fired by Pierson's charge that "all should go, and go to all," these young missionaries believed they could bring about "the evangelization of the world in this generation."

A newly organized interdenominational Student Volunteer Movement (1886–1946)—initially an outgrowth of the Young Men's Christian Association (YMCA)—took up the world evangelization "watchword" and defined the zealous, optimistic faith of this new mission era. YMCA activists like Dwight L. Moody, John R. Mott, and Luther Wishard inspired nearly 10,000 college students to volunteer for mission service by the turn of the century. Among them was a growing contingent of American women, who joined the Young Women's Christian Association (YWCA) and made up 55 percent of the mission force by 1910. During the American Woman's Missionary Jubilee celebrations held in forty-eight cities across the nation during 1910 and 1911, thousands of women regaled the accomplishments of fifty years of the Woman's Work for Woman global ministry and

looked forward to a bright future for an ecumenical church women's movement in the overseas missions.

Confronting Nationalism in Foreign Mission Fields

The mission experience challenged some American missionaries in ways they had not anticipated. American missionaries worked closely with native Christians in the foreign fields in the late nineteenth and early twentieth centuries, and they were forced to respond to nationalist aspirations among the populations they sought to convert and westernize. As American missionaries opened new mission fields in Latin America after 1870, some Latin American progressives welcomed their presence. Ministering to the masses of indigenous poor rather than to the landed rich and those of European origins, American Protestant missionaries distinguished themselves from the long established Roman Catholic missions and churches in the region. American Protestants brought their late-nineteenth-century progressive and democratic values with them to Latin American mission fields, and these ideas were well-received by some segments of the Latin American populations.

Yet they also brought their expansionist faith in America's manifest destiny and sometimes shared their government's political goals, which undercut their legitimacy with the Latin American nationalists they sought to convert. At the same time, some American missionaries struggled to define a "Christian imperialism" motivated by altruism and a desire to improve the lives of native populations less fortunate than their own and tried to distance their civilizing mission from the self-serving and acquisitive imperialism of their nation's businessmen and politicians who aimed to build an overseas empire.

In established mission fields in Asia and Africa, the new generation of American Protestant missionaries discovered changes among native populations, too. Although native populations in these fields were still reluctant to convert to a "foreign" religion, they were far more eager to acquire a western education from the missionaries than earlier generations had been. From the perspective of native nationalists in China, or Japan, or India, discovering the secrets of western wealth and power through a western education might reveal the keys to resisting western imperialism and "liberation" from western colonial control might be more meaningful than Christian "salvation" from original sin. Asian natives who did convert to Christianity were often motivated by certain aspects of Christian teachings that spoke to what they perceived to be the weaknesses or needs of their own societies.

Many Japanese Christians, for example, were inspired by the Christian ethic of social service in a time of transition among their national leadership. As a new constitutionally based Japanese government led by the Meiji emperor stripped the samurai warrior class of its hereditary role to serve the feudal shogunate, many former samurai families converted to Christianity and acquired western educations. They found a new moral foundation for their lives and new avenues to serve the Japanese nation in its modernizing project.

Evaluating the American Mission Movement

Young Men's Christian Association leader and mission enthusiast Robert Speer estimated that by 1950, western missionaries had converted 1.5 million non-western natives to Protestant Christianity, and in 1910, estimated that nearly 800,000 new converts had been added to the Christian fold. These numbers seemed impressive but represented only a fraction of the non-western populations in the mission fields. Far more successful were the number of schools and medical facilities that resulted from the missionaries' civilizing activities. These endeavors improved health conditions and spread literacy among native populations. In part, these results were the consequence of an increasing proportional number of laypersons among the missionaries' ranks. By 1910, nearly 70 percent of the American mission force was made up of laypersons, up from 52 percent in 1868.

Laypersons in the field tended to hold liberal Protestant beliefs. They deemphasized denominationalism and doctrinal differences among Protestant churches. The holistic Social Gospel, rather than engaging in pure evangelism, guided their mission activities. Nonetheless, many continued to adhere to the ultimate goal of the American mission movement, world evangelization. When in 1932 the ultraliberal "Laymen's Inquiry" financed by John D. Rockefeller, Jr. and compiled by William Ernest Hocking evaluated the historic record of over 100 years of the American Protestant mission enterprise and recommended new mission policies, many liberal missionaries in the field disavowed its conclusions. Hocking's report on the Laymen's Inquiry, or *Re-Thinking Missions*, advised Protestant missionaries to promote the expansion of world spirituality and to collaborate with

other world religions rather than seek to convert all to Protestant Christianity.

The mainline Protestant American mission movement declined after 1930. Its strength and confidence were undercut by widening rifts between fundamentalists and liberal Protestants who disagreed about the nature and purpose of the foreign missions. Moreover, mainline Protestant churches struggled to meet the needs of congregations in the United States during the Great Depression, and deep cuts in church and mission board budgets reduced funding to send missionaries abroad. Separate auxiliary women's mission boards were merged into Protestant denominational boards, and the distinctiveness enjoyed by the American women's mission movement disappeared as its already limited institutional autonomy disappeared. In addition, as more professional opportunities opened to women in the United States, the number of women who pursued a mission career through traditional Protestant church mission channels decreased. After 1930, faith-based missionaries, who operated outside the bounds of institutional churches and raised their own funds for evangelical ministries to the "unsaved" populations, supplanted the mainline Protestant church missionaries in the field.

YMCA-YWCA

The Young Men's Christian Association (YMCA) and Young Women's Christian Association (YWCA) were Protestant Christian social service organizations founded by middle-class professionals in England in the 1840s (YMCA) and 1850s (YWCA). Initially, these gender-based organizations provided Bible study, and soon afterward recreational programs, for men and women working in industrial factories. Seeking to fill a perceived void in spirituality and to instill Christian values among the working classes, Christian laypersons in evangelical Protestant denominations formed the YMCA and YWCA to provide a "useful" and holistic ministry to needy populations. YMCAs and YWCAs were led by boards of directors; male businessmen served on YMCA boards and women of the leisured middle class served on YWCA boards. They employed professional teachers and social workers, or "secretaries," to carry out programs and services. This YMCA-YWCA organizational model soon spread to other countries in Western Europe and to North America.

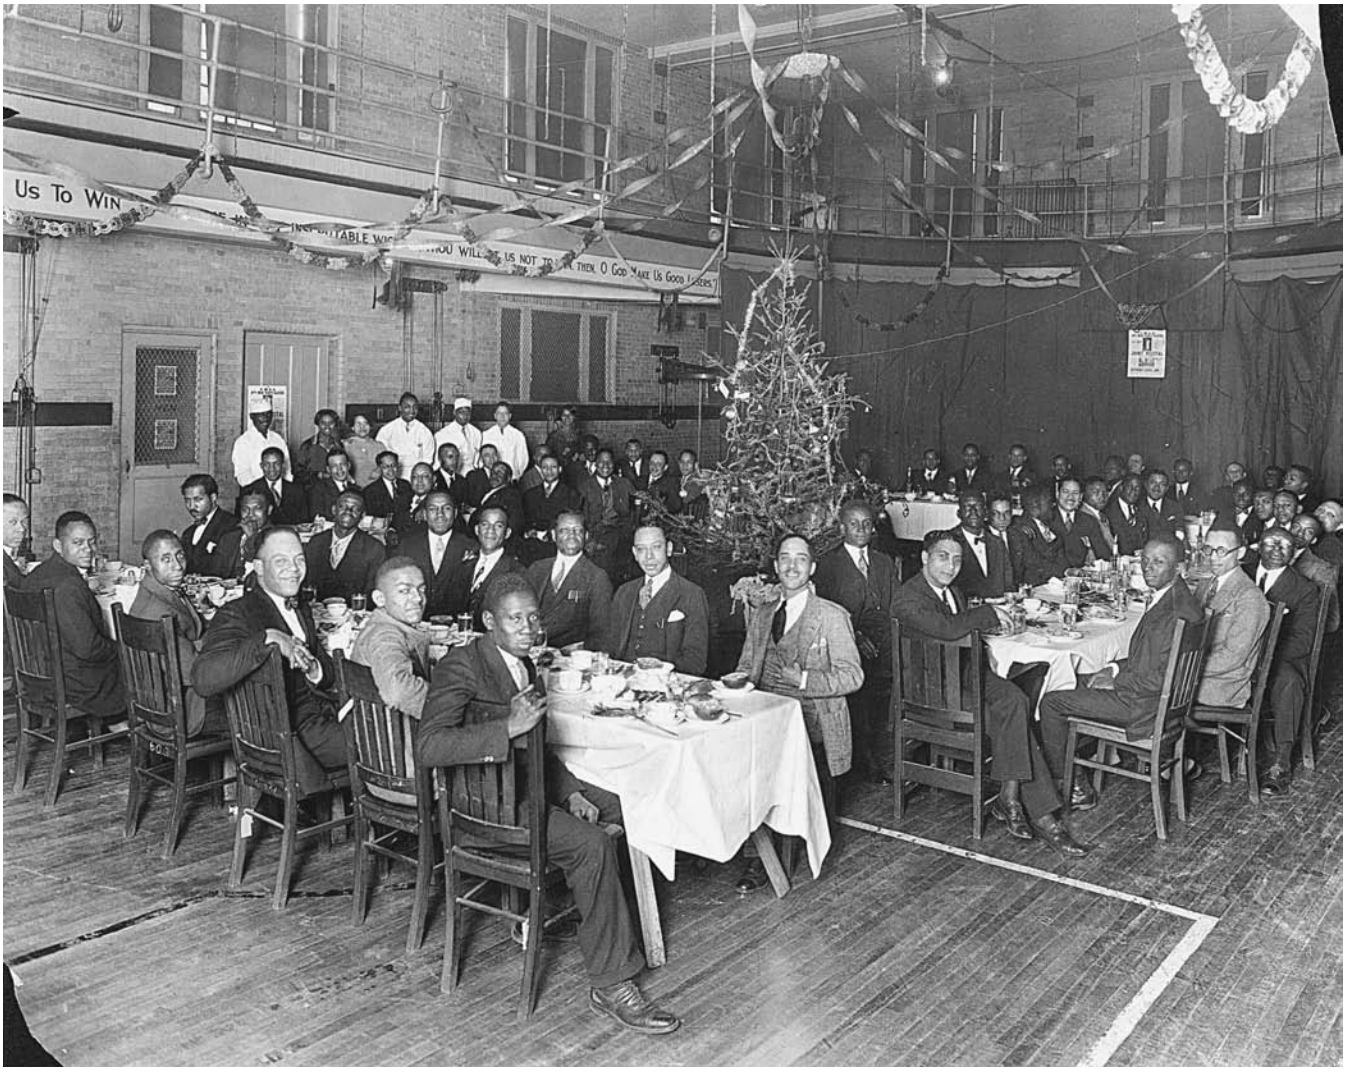
The American Associations

Zealous American middle-class reformers embraced the YMCA-YWCA activist "fourfold" philosophy to minister to the spiritual, intellectual, social, and physical needs of young American workers in New England's industrial towns, and Southern and Eastern European immigrants who settled in cities on the East Coast and in the Midwest. Evangelical preacher Dwight L. Moody preached the message that God's salvation was available to all who sought it sincerely, and began to campaign for YMCA recruits to help spread the "good news" on college campuses in the 1860s. By the 1880s, YMCA and YWCA chapters were thriving institutions on many college campuses, involving students in community service projects, recruiting them for professional social service careers when they graduated. Inspired by Moody and by ambitions to become a foreign missionary, Luther Wishard, a YMCA secretary at Princeton, decided to take the American YMCA idea to the foreign mission fields.

The YMCA (and soon, the YWCA) foreign mission message was salvation and social service; the medium was American college students. In summer 1886, Wishard and Moody hosted a student conference on Moody's Northfield, Massachusetts, Seminary campus. Reverend Arthur T. Pierson preached a rousing call to mission to the assembled students and, by the conclusion of the conference, one hundred college men had pledged themselves to mission service and the Student Volunteer Movement was born. Through Wishard's fierce campaigning and the support of YMCA leader John R. Mott who shared his vision of the YMCA's foreign mission potential, the American YMCA national board was persuaded to begin, in 1891, to support a few "foreign secretaries," who would develop YMCA organizations in India, China, and Japan along American organizational lines. American missionaries in foreign fields supported the expansion of the YMCAs and requested more secretaries, male and female, to serve the needs of youths in their mission districts. By 1895, the American YWCA, too, joined in the mission movement.

Characteristics of American YMCA and YWCA Foreign Work

From the inception of their overseas mission work, American YMCA and YWCA foreign secretaries tried to follow the guiding precept to plant the "association idea," organizing young native mission school students or college men and women in Bible study, community service projects, and recreational programming to discipline their spirits, minds, and bodies in conjunction with Christian teachings and American pluralistic principles. American foreign sec-



Members of the Young Men's Christian Association, or YMCA, attend a Christmas party in Harlem, New York, in the early 1920s. The YMCA—along with the Young Women's Christian Association, or YWCA—began in the mid-nineteenth century as a religious institution to promote Bible study and spiritual growth. The organizations gradually evolved into community-based institutions that offered a wide range of social, recreational, and intellectual activities. *(Brown Brothers)*

retaries cultivated native youths to become leaders within their own national YMCA and YWCA organizations. But both American YMCA and YWCA secretaries encountered obstacles in the foreign fields. American foreign secretaries professed to find it difficult to train YMCA and YWCA members who displayed the leadership qualities that the Americans could recognize and appreciate. YMCA or YWCA leaders took programming in nationalist directions that alarmed some American foreign secretaries who considered foreign nationalism divisive, failing to recognize that their own American value-laden Christian message was far from the "universal" message they claimed it to be.

Some American YMCA and YWCA secretaries, however, developed a deep understanding and sympathy for the nationalist views of their co-workers and constituents in the foreign fields. Beginning in the 1910s, the YWCA, and, in the 1920s, the YMCA, adopted the Social Gospel creed, and their interactions with the poorest and most exploited workers and peasants in foreign societies forced them to confront the legacies of Western European and American colonialism, and to recognize their own complicity in

the Western imperialist enterprise. Beginning with the Spanish-American War in 1898, YMCA secretaries had accompanied American soldiers to fields of war in Cuba and the Philippines. During World War I, YMCA and YWCA secretaries served the Allied Western forces in Europe; in World War II, they served in Europe and Asia. Some American foreign secretaries realized that their social service had political ramifications.

The Transformation of American YMCA and YWCA Foreign Work

As with the mainline Protestant missions, the American YMCA and YWCA foreign secretary presence reached its peak in foreign mission fields in the 1920s. The Great Depression forced the American YMCA and YWCA to reduce the number of secretaries they sent abroad, and to limit funding for foreign building projects. After the 1930s, men and women assumed leadership of their own national YMCAs and YWCAs, and a few American foreign secretaries served in advisory roles when invited by national associations.

For both the YMCA and YWCA, international relationships were transformed in the post–World War II period. The Cold War divided the Communist and non-Communist world, and led to the restriction of the American YMCA and YWCA to non-Communist nations allied to the West. The YMCA and YWCA supported demands for decolonization and independence within the non-Western world with increasingly culturally sensitive policies and services. The American YMCA "Foreign Service" Division changed its name to "World Service." It has continued to promote mutual understanding of cultural differences among YMCAs globally and to offer funding, personnel, and other resources to independent YMCAs in other nations to meet self-defined local needs. The U.S. government's Peace Corps program, established in 1961, followed the YMCA "World Service" Division model. The American YWCA also changed the name of its "Foreign Division" to the "International Division" in 1961 and since the end of World War II has gradually deferred control over funds and personnel devoted to international initiatives. The World YWCA, based in Geneva, participates in a global women's movement as a leading women's international Non-Government Organization (NGO) that interacts with the United Nations and other global agencies and supports feminist, antiracist, human rights and social justice campaigns worldwide.

Rural Utopian Movements
1820s–1850s

Since European settlement began, North America has proved a rich breeding ground for communal, cooperative, and collaborative settlements and communities. One recent study has enumerated over 900 such settlements founded up to 1965 in the territory of the United States alone, not counting monastic communities of the Catholic and other mainstream churches. Of this total, almost 250 were formed before 1860, and of those in turn the majority existed during the forty years or so leading up to the American Civil War. Their formation and respective fates were emblematic of major themes in this period's social history: the intersection of religious and secular impulses; the influence of European ideas on American movements; and a deep interest in experimentation in pursuit of social reform. The antebellum period was not unique in producing communal and cooperative utopias: there were comparable episodes in the 1890s and again in the 1960s. But some historians have suggested that at no other time in American history were such movements so closely linked to mainstream political and cultural developments, or so close to influencing patterns of change in society at large.

German Pietism

Communal ventures of various kinds had accompanied early English settlements in North America, but few had lasted long. During the eighteenth century, however, German pietist groups had established settlements that operated temporarily or permanently on communal lines. Moravian missionaries had for a time conducted communal arrangements in their settlements at Bethlehem, Pennsylvania, and elsewhere. Significant numbers of Anabaptists, including Swiss Mennonites and Alsatian Amish, whose core American settlements also lay in Pennsylvania, maintained close-knit communities of mutual support even while retaining private property and individual family households. Amish settlements in Lancaster County, Pennsylvania, founded in the 1730s, remained small until the later nineteenth century, but were expanding and adding congregations during the antebellum period. But some early nineteenth-century pietist groups adopted communal arrangements. The Harmonists, led by George Rapp, lived at a sequence of successful communal settlements in Pennsylvania and Indiana from 1805 to 1905; the similar Society of Separatists of Zoar, founded in Ohio in 1817, retained its communal organization until 1898. The Rappites' and Zoarists' success pointed the way for pietist settlements at Ebenezer, New York, in the 1840s and Amana, Iowa, in 1854, as well as for the large post–Civil War colonies of Hutterites in the Great Plains region that would become the most extensive and stable of all communal settlements in North America.

Significant as all these groups were, however, their religious and ethnic characteristics limited their wider impact on American society. They were divisions of or reactions to German Lutheranism and its European offshoots. They recruited almost exclusively from among German populations and retained German-language and religious practices. Although some originated in missionary efforts, the communities remained largely self-contained. North America provided a shelter for religious practices that was difficult to sustain elsewhere, and their emphasis lay in withdrawal from society and the preservation of pure religious observance. Zoar, for instance, was named for the place to which, in the book of Genesis, Lot fled to escape the evils of Sodom.

Millennialism and Reform

The communal dimensions of English-speaking religious movements, however, did have wider links with the American social reform movements of the antebellum period. A common characteristic of Anglo-American Protestantism in this period was its millennialism, the confidence that at some point

Christ would return to rule on earth. This belief had two kinds of influence on communalism. Some groups, holding that the millennium had already occurred, sought to build perfect societies that would express the rule of heaven on earth. Others, religious and secular, were profoundly influenced by the concept of "postmillennialism," the idea that Christ would only return to a world made ready for him—a spur to social action and to campaigns for social reform.

Prominent among groups of the first kind were the United Society of Believers in Christ's Second Appearing, popularly known as the Shakers for their dance-like form of worship. Originating in a small group of English believers who migrated to America in the 1770s with their leader Ann Lee, Shakerism crystallized in the 1790s into a significant communal movement which in due course built twenty-two village settlements from southern Maine to central Kentucky and had, at its peak around 1850, almost 4,000 adherents. Lee had died in 1784, but her successors, particularly Joseph Meacham and Lucy Wright, forged a set of communal arrangements based on the surrender of private property, the abolition of marriage, and strict celibacy. Shakers believe that God has both male and female components, and that Ann Lee had been Christ's female counterpart. Because they were living in the millennium, Shaker communities were therefore miniature heavens on earth, led by a hierarchy of male and female ministers and deacons. Centers of agricultural and craft production, most Shaker villages achieved considerable economic efficiency and prosperity in the first half of the nineteenth century.

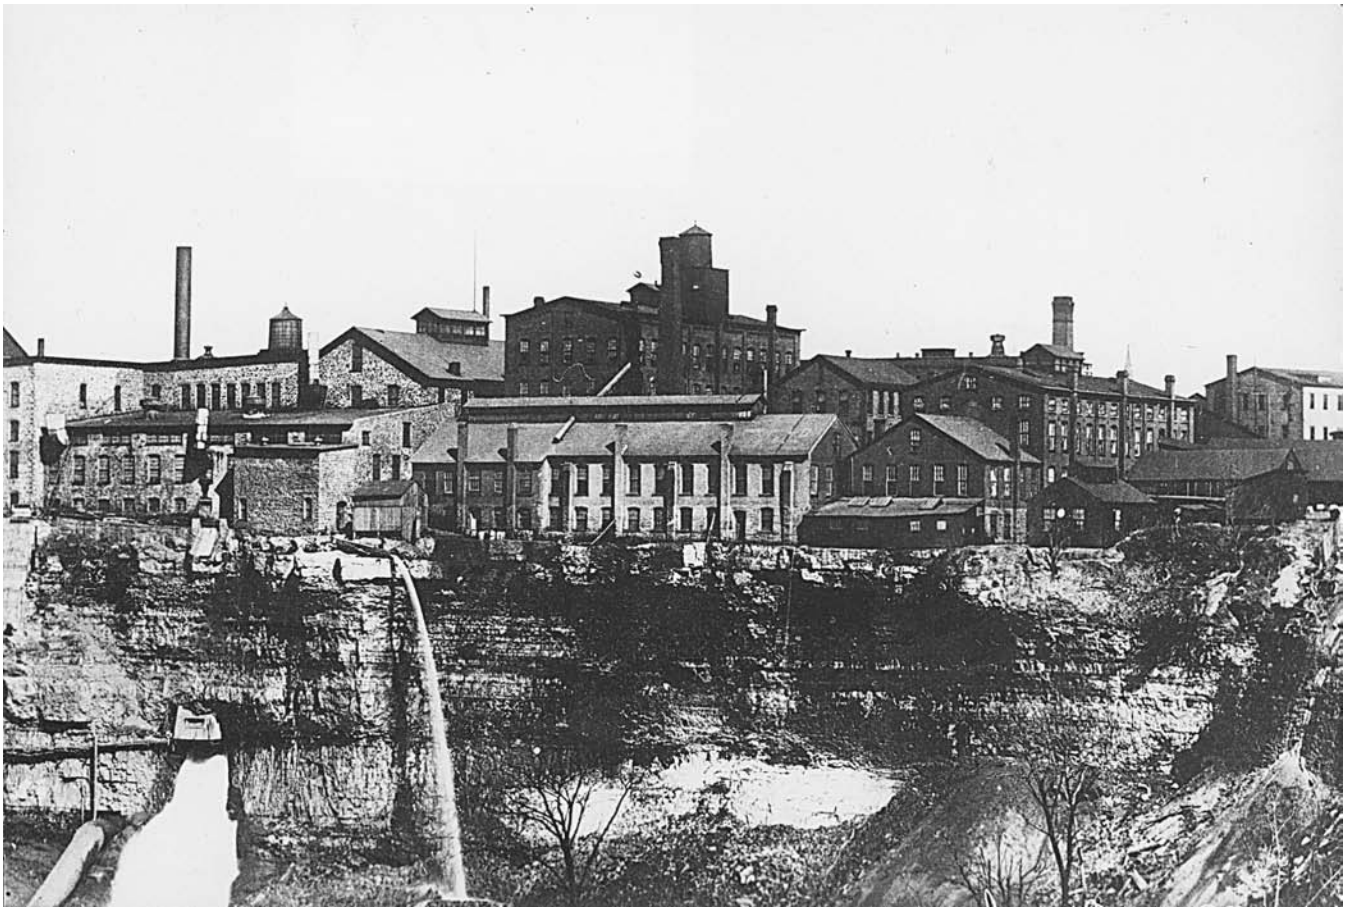
Though enjoying brief revivals, however, Shakerism entered a long period of decline in the 1850s as its social and religious arrangements marked it out clearly from mainstream society and it lost most of its impulse for missionary work. It has never died out (one community still operates today), but most of its villages were abandoned or sold between 1875 and the 1920s. Shaker communities and economic arrangements, rather than their beliefs or celibate practices, nevertheless influenced other reformers. Members of subsequent communities sometimes studied Shakerism for the lessons it might provide. Friedrich Engels later proclaimed it to be a successful model for a Communist society.

In the 1820s and 1840s, events in Europe and the United States combined to produce further efforts at creating communal settlements in America. The Welsh-born reformer Robert Owen, having developed a model factory community in Scotland, and frustrated at Parliament's obstruction of necessary social reforms, inspired several communal settlements, including that at New Harmony, Indiana, which Owen himself founded in 1825 on a site purchased from the Rappites. Optimistic to a fault, Owen at first proclaimed rapid progress at New Harmony toward his goal of achieving a community without private property, but by 1827 disputes and divisions had so disheartened him that he backed away from this intention and the community dissolved. Owen held that social ills derived from circumstances and that reform would follow from the creation of an ideal form of society. This inspired the recruitment of a wide range of members, from intellectuals to prairie farmers, but many failed to meet Owen's expectation that they would see the reason of his prescriptions and fall into a new way of life. Owen covered his retreat from New Harmony with the accusation that his followers had not been worthy of the experiment. Meanwhile, his public pronouncements on marriage, property, and religion had incurred the wrath of the conventional churches. Owen also inspired the effort of the English radical Frances Wright to establish a community for freed slaves at Nashoba in Tennessee in 1826, but this also failed on Wright's patronizing assumptions and poor organizing ability. Publications on birth control by Owen's son, Robert Dale Owen, and Wright's self-description as a "free enquirer" added to the furor over Robert Owen's own radicalism and helped shape the ideological climate into which subsequent communal movements emerged.

Although Owen is best understood as a pioneer Socialist, cooperator, and secular reformer, the confident, almost messianic tone of his pronouncements gave his movement many parallels with contemporary millennial thought. And it was the climate of postmillennialist reform movements, coupled with economic distress, which gave rise to the next and greatest antebellum surge in community founding. During the early-to-mid-1840s, over sixty communities were established in the United States. Although they had varied roots, they shared a set of overlapping contacts with the broader stream of social reform movements that had been gathering weight over several years.

Communities of the 1840s

A financial panic in 1837 led to a severe economic downturn that particularly affected the Northeast, the region most touched by the growth of capitalist industry and commerce. Coincidentally, movements in the same region to campaign for the abolition of



One of the most successful and long-lasting of the nineteenth-century utopian societies, the Oneida Community in upstate New York manufactured silverware, steel traps, and embroidered silks. The group was best known for its practice of "complex marriage," by which members had multiple sexual partners and children were raised communally. *(Brown Brothers)*

Southern slavery and other reforms also ran into difficulties. Economic depression fostered discussions in urban, intellectual circles about the ideals of rural life, and a "back to the land" movement began to ripen. Discussions among reformers about the problems they faced reinforced this trend with interest in communities as an ideal form of social organization. Publicity for these discussions was provided not only in specialist reform periodicals and newspapers, but also in the wider press, particularly the newly founded New York *Tribune*, edited by Horace Greeley.

In Massachusetts, debates among Unitarians about the church's role in social reform, and among the Boston transcendentalists, led to the establishment of a community at Brook Farm, a rural site just outside Boston, in 1841, led by the former Unitarian minister George Ripley. The same year, a group of "Practical Christians" under the Universalist minister Adin Ballou, set up what they called Fraternal Community Number One not far away, at Hopedale, Massachusetts, in what they expected to be a model for the establishment of ideal Christian societies across the land. The following year a group of radical abolitionists founded a cooperative community at Northampton, in western Massachusetts, in the hope of establishing a model of industrial, agrarian, and educational work in a rural environment, free from the strictures and practices of conventional churches. Abolitionists were also instrumental in founding, subsequently, a number of communities in Ohio and Indiana. In all of these cases, secular and religious ideals were closely intermixed.

Also growing out of this reform environment, though with a strong and distinctive religious dimension, was a community first founded in the early 1840s at Putney, Vermont, that moved to Oneida, New

Reacting to the growing materialism, acquisitiveness, and competitiveness of industrial capitalism, French social theorist Charles Fourier advocated small cooperative communities called "phalanxes," based on handicrafts and agriculture. Americans organized phalanxes in the mid-1840s from Massachusetts to Wisconsin. *(Brown Brothers)*

York, in 1848. Led by its religious head, John Humphrey Noyes, Oneida was truly communal in the sense that private property was abolished, members participated in a regulated system of group marriage tempered for two decades by what Noyes called "male continence," or self-restraint to prevent ejaculation during intercourse. After the Civil War, Noyes modified this "complex marriage" regime into an early eugenic experiment, in which couples selected by him for their superior spiritual attributes were permitted to conceive children, to be raised by the community. Oneida continued as a communal group until 1881.

But these religious-based communities formed part of a wider movement that had, once again, secular and European origins. Owenism revived briefly in the 1840s and some new settlements were founded, but the greatest impetus came from American followers of the French social theorist Charles Fourier (1772–1837). Inspired by the writings of the chief American Fourierist, Albert Brisbane, and supported by Horace Greeley and others, several thousand American artisans, workers, and professionals acted to form new communities in the mid-1840s. Only about one in ten of the members of Fourierist groups were farmers, but most communities were founded in rural locations accessible to urban markets.

Fourier's own writings centered on the perception that social harmony could be secured by building societies capable of permitting humans' built-in predispositions, which Fourier called "passions," to function. His calculations indicated that ideal communities, which he called "phalanxes," would consist of 1,600 to 1,800 men and women who would share the full range of available attributes in combination. Brisbane and other American interpreters stepped around the more fanciful of Fourier's visions and focused on his prescriptions for the organization of property and work, a combination of private ownership and cooperation that they called "Associationism." They offered life in communities as a preferable alternative to the drudgery, competitiveness, and waste of capitalism. Cooperation would, above all, permit men and women to exploit their talents and desires by applying Fourier's doctrine of "attractive industry," in which work was organized and individuals' tasks varied frequently so as best to match their natural inclinations. Associationists took pains to distance themselves from Owen's critiques of existing society. Fourier's theories, they insisted, would not abolish property, but would merely pool its uses for mutual advantage. Fourierist phalanxes would promote religious freedom and uphold the principles of monogamous marriage and family life.

Greeley, Brisbane, and other leaders had advocated a concerted effort to raise funds to build a full-scale version of a Fourierist phalanx, but in practice some thirty smaller communities were established in the mid-1840s, at sites from New Jersey to Wisconsin. Most were short-lived; twelve lasted a year or less. Still, a handful, like the Wisconsin Phalanx at Ceresco (later Ripon) showed signs of prosperity, and one, the North American Phalanx at Red Bank, New Jersey, lasted twelve years. The Associationists' greatest triumph was to convert George Ripley and his followers at Brook Farm to the virtues of Fourierism early in 1844. Brook Farm not only became the intellectual heart of the movement, publishing its chief periodical, the *Harbinger*, but it adopted organizational changes to accommodate Fourier's theories of attractive labor.

Associationism faced a serious dilemma. On one hand, the failure to concentrate efforts prevented the investment of sufficient capital on a single site and made most communities prey to financial weakness and failure. On the other hand, dispersed communities offered opportunities for participation to supporters across the Northeast and Midwest, and, by avoiding the rigidity of following a single prescribed community pattern, may well have fostered the movement's survival into the 1850s. Nevertheless, most of the communities did not survive the 1840s; two founded in the 1850s, at Raritan Bay, New Jersey, and La Reunion (near Dallas), Texas, were short-lived.

Comparison of Fourierism in America with another French-inspired communal movement of the period illustrates some of the complexities entailed in introducing communalism to an existing American population. The French theorist Etienne Cabet, having published in 1839 a novel, *Voyage en Icarie* (Journey to Icaria), describing an imaginary community, found himself heading a movement to enact this in reality. Thus, in 1849 he set out in advance of several hundred followers to establish a settlement, first in Texas, then in Illinois. By the time of Cabet's death in 1856, the movement had split, but small Icarian communities continued near St. Louis, Missouri, in Iowa, and in California until the 1890s. Unlike the Fourierist phalanxes, these had adopted communal property; unlike them, too, they had remained almost entirely French, and French-speaking, in their membership. Though secular in character, the Icarian communities shared the communalism and cultural uniformity of some of the German pietist groups, and this may have contributed to their relative longevity.

Evaluating Antebellum Communities

Communities founded during the 1840s lasted, on average, less than two-and-a-half years. By the end of the antebellum period, with the exception of Oneida and the Icarian communities, few new communal groups survived, while the preexisting Shakers and various German groups continued. Scholars have debated the significance and implications of this pattern. Conventionally, historians dismissed antebellum communalism as marginal, ephemeral, or irrelevant to major issues. Recent studies have taken a different perspective, indicating the role of community-founding in the wider context of social reform movements, and tracing the influence of movements like Fourierism on other activities, such as land reform, the labor movement, and health reform, that long survived them. Paradoxically, community efforts also fostered ideas about individualism. The strong individualist current that emerged in Transcendentalist writing, especially that of Ralph Waldo Emerson, was in part a response to the formation of Brook Farm. Among Robert Owen's members at New Harmony in the 1820s were Josiah Warren, who later emerged as the pioneer American Anarchist, who formed two communities in Ohio in the 1830s and 1840s before establishing, with Stephen Pearl Andrews, the Modern Times community on Long Island (1851–1863) dedicated to the principle of "individual sovereignty."

Scholars have also considered the factors that can help explain why some communities lasted longer than others. Rosabeth Moss Kanter, in an influential study in the 1970s, suggested that engagement of members in a series of "commitment mechanisms" that bound them to one another and separated them from wider society, was a key feature of groups that lasted significant periods of time. Shakers, German pietists, the Oneidans, and Icarians all adopted communal property and sets of religious and social practices (such as celibacy and "complex marriage") that demanded personal sacrifice or set members off from the rest of society. Fourierists and others who attempted to gain the benefits of communal living without entirely altering their social or economic arrangements often found it harder to sustain their communities. Financial problems, common to small groups in their early years, were more likely to drive members away than they were in religious communes. Above all, perhaps, the lure of communal living and the advantages that it could manifestly offer were only competitive with conditions in the surrounding society when general economic circumstances were hard. As opportunities for employment or profit improved with the economic revival of the late 1840s, inducements to stay in communities that did not entail "commitment mechanisms" were relatively weak. And to the extent that Fourierists and others had conjured up visions of prosperous abundance in their communities, they were exposed to the harsh competition of a thriving and expanding national economy with the limited resources and short-term prospects of dozens of struggling nascent communes.

New Harmony Movement

The early 1800s in Great Britain, with the onset of the industrial revolution, was a time of social upheaval. The poor and underprivileged flocked to employment in the manufacturing industry, which gave rise to the factory town. A cruel and unyielding environment often faced these families, who lived in crowded slums with poor sanitation and bad food, and who suffered long, harsh working conditions. It was not uncommon for children as young as five or six to work ten-hour shifts. High unemployment made families desperate, while investors and other capitalists reaped unheard of and often obscene profits from the labors of the lower class. Into this maelstrom of change stepped philanthropist, manufacturer, and social reformer Robert Owen.

Like his competitors, Owen reaped the benefits from the system, but unlike them, he did not seek to squeeze more profit from the laborers who produced the wealth. After purchasing the textile mill and its factory town of New Lanark, Scotland, Owen began experimenting with ways to improve the working and living conditions of his employees, and he began to observe that his changes resulted in increased productivity and happiness. Through these observations, Robert Owen developed his theory of character formation and education—that man's character is formed for him, not by him—which ultimately led him to establish the first secular utopian community in the Americas.

Utopian Dream

On October 2, 1824, Owen set sail from Liverpool with his youngest son William and Owenite disciple Captain Donald MacDonald to visit the Rappite settlement at Harmonie, Indiana, which was up for sale. Owen and his party arrived at Harmonie on December 16, accompanied by Frederich Rapp, the adopted son of "Father" George Rapp, a German religious leader who believed in the Second Coming of Christ. On January 1, 1825, Robert Owen purchased the village of Harmonie from Father Rapp for $125,000 of his own money. He renamed the village New Harmony and took ownership of 20,000 acres that contained 180 log, frame, and brick structures, public buildings, manufacturing establishments, shops, and housing for 700. Owen left his son William and Captain MacDonald at New Harmony and set off to return to New Lanark.

Before embarking for Scotland, Owen, who had achieved some celebrity, as well as some notoriety about his social theories, spoke twice at the U.S. House of Representatives, met with incoming president John Quincy Adams and current president James Monroe, and stayed overnight with former president Thomas Jefferson. Perhaps Owen was swept away by his reception on the continent, or perhaps he was just anxious to start on his dream, but for some unknown reason, he did not formulate any plans to administer his new community. In spite of his reputation as an effective manager, Owen ignored his son William's advice to exercise caution in admitting persons to the Indiana community. While in the East, Owen "issued a manifesto inviting all who were in sympathy with his aims to proceed to New Harmony to join the New Community." Hundreds responded to the invitation and quickly descended upon New Harmony, overwhelming young William Owen in the absence of his father. William later confided in his journal, "The enjoyment of a reformer is much more in the contemplation than in the reality."

The Preliminary Society

Robert Owen returned to New Harmony on April 13, 1825, to find the village in chaos. A collection of 700 to 800 individuals, a mix of freethinkers and freeloaders, had already moved to the community, and more people arrived every day. On April 27, 1825, just two weeks after his arrival, Owen addressed the commu-

nity membership in the old Rappite church: "I am come to this country to introduce an entire new state of society." On May 1, 1825, the Preliminary Society of New Harmony was formed. Members adopted for their community the constitution that Owen had proposed. It was preceded by this statement:

> The Society is instituted generally to promote the happiness of the world. This Preliminary Society is particularly formed to improve the character and conditions of its own members, and to prepare them to become associates in independent communities, having common property.

The constitution called for what Owen described as a "halfway house" that would help members make the transition from the old system to the new.

Seven Month Absence

After the Preliminary Society's adoption of the constitution, Owen remained in New Harmony for a little more than one month before returning to New Lanark in June 1825. The purpose of this trip was to settle his affairs, which included providing for his wife and two of their daughters, Ann and Mary, who had decided to remain in Europe. Their third daughter, Jane Dale, along with her four brothers Robert Dale, William, David Dale, and Richard, all chose to settle in New Harmony. (By 1832, Mrs. Owen, Ann, and Mary had all died.) The senior Owen did not return to New Harmony until January 12, 1826. During his seven-month absence, the chaos in the New Harmony community had progressed, and the Harmonists looked forward to Owen's return to solve the problems. They expected that under Robert Owen's practiced hand, the community's idle factories would soon be in full operation and all the founder's projected plans, including building a new village of unity and cooperation, would be undertaken.

The Boatload of Knowledge

To help fulfill the promise of New Harmony, Owen had vowed to bring to the community a boatful of the finest minds of the time. The keelboat, *The Philanthropist*, subsequently dubbed the "Boatload of Knowledge," arrived in New Harmony on January 18, 1826. Its passengers helped cement New Harmony's place in history. Included in the impressive collection of teachers, thinkers, and scientists were Thomas Say and William Maclure. Naturalist, entomologist, and esteemed conchologist, Thomas Say later became known as "The Father of American Zoology." Say was also curator of the American Philosophical Society after 1821, and he served as professor of natural history at the University of Pennsylvania.

Robert Owen's partner, William Maclure, was a scientist and social/educational reformer with two passions, which ultimately outshone and outlasted those of Robert Owen. Born in Ayr, Scotland, in 1763, Maclure's life paralleled Owen's in several respects. Both were self-made men interested in social reform and the improvement of society, and both were willing to risk their own fortunes and reputations to prove their theories. Maclure's passion for geology led to his founding the American Geological Society, as well as to his being named "The Father of American Geology." His passion for learning changed the face of American education. Maclure had become an ardent advocate of the teaching methods of Swiss educator Johann Heinrich Pestalozzi, and he had sponsored schools in France and in Spain based on the Pestalozzian method.

Maclure had visited Owen's model factory town at New Lanark in 1824, after which, Owen invited Maclure to become a partner in the New Harmony venture. He asked Maclure to set up the Center for Education and Scientific Study in New Harmony. Maclure recruited all the passengers who ultimately embarked on the Boatload of Knowledge, and he instituted the Pestalozzian teaching method at New Harmony, which became the model for America's public school system. Maclure opened the first School of Industry in the United States at New Harmony, and he pioneered the trade school concept.

Community of Equality

Shortly after returning to New Harmony in 1826, Owen was excited by what he perceived to have been accomplished in his absence, despite all the evidence to the contrary. The Preliminary Society had been created to allow members to convert to the Owenite system and to allow enough time to pass so they might learn to trust each other. Many felt nothing had been accomplished and based all hope of success on Owen's return. Owen however, was so carried away by his own optimistic perceptions that he decided to end the transitional Preliminary Society two years before it was due to expire. Perhaps Owen moved too quickly to form its successor, the Community of Equality. A committee of seven was chosen to draft a constitution, which was adopted on February 5, 1826. Equality's constitution began with this declaration:

> When a number of the human family associate in principles which do not influence the rest of the world, a due record to the opinions of others requires a public declaration of the object of their association, of their principles and their intentions. Our object is that of all sentient beings, happiness.

It was followed by these Owenite Principles:

> Equality of rights, uninfluenced by sex or condition, in all adults.
> Equality of duties, modified by physical and mental conformation.
> Cooperative union, in the business and amusements of life.
> Community of property.
> Freedom of speech and action.
> Sincerity in all our proceedings.
> Kindness in all our actions.
> Courtesy in all our intercourse.
> Order in all our arrangements.
> Preservation of health.
> Acquisition of knowledge.
> The practice of economy, or of producing and using the best of everything in the most beneficial manner.
> Obedience to the laws of the country in which we live.

The constitution outlining Robert Owen's philosophy included the following:

> We hold it to be self evident:
> That man is uniformly actuated by the desire of happiness.
> That no member of the human family is born with rights either of possession or exemption superior to those of his fellows.
> That freedom is the sincere expression of every sentiment and opinion, and in the direction of every action, is the inalienable right of each human being, and can not be limited except by his own consent.
> That the preservation of life, in its most perfect state, is the first of all practical considerations.
> And that, as we live in the state of Indiana, submission to its laws and to those of the general government is necessary.
> Experience has taught us:
> That man's character, mental, moral and physical, is the result of his formation, his location, and of the circumstances within which he exists.
> And that man, at birth, is formed unconsciously to himself, is located without his consent, and circumstanced without his control.
> Therefore, man's character is not of his own formation, and reason teaches us to a being of such nature, artificial rewards and punishments are equally inapplicable; kindness is the only consistent mode of treatment, and courtesy the only rational species of deportment.
> We have observed, in the affairs of the world, that man is powerful in action, efficient in production, and happy in social life, only as he acts cooperatively and unitedly.
> Cooperative union, therefore, we consider indispensable to the obtainment of our object.

According to Owen, the hasty transformation from the Preliminary Society to the Community of Equality was a contributing factor in the experiment's failure. The services of members were no longer paid in proportion to their value to the community, but equal payment was made to all members based solely on age, rather than by contribution. In *Threading My Way; An Autobiography* (1874), Robert Owen's son, Robert Dale Owen, indicated that he regretted letting this event transpire. "I had too much of my father's all-believing disposition to anticipate results which any shrewd, cool-headed business man might have predicted. How rapidly they came upon us!"

Dissension

A group of dissidents who disagreed with the new Community of Equality on religious grounds soon branched off to form a separate community, which they named Macluria (although William Maclure had nothing to do with this community). Macluria's members were mainly English farmers who were not happy with what they perceived as Owen's atheistic views. They kept most of the ideals and structure of the parent community (Equality), except they withdrew the right of women to vote in the assembly.

In mid-February 1826, superintendents were elected to oversee the various elements of the Harmonists' activities in the Community of Equality; these activities included agriculture; manufactures and mechanics; literature, science, and education; general economy; and commerce. The voices of dissension grew louder. Many people were unhappy with how the elected council was running community affairs, and Robert Owen was asked to take stewardship of the community while leaving the new constitution in force. In early March, yet another offshoot com-

munity formed. This one took its name, Feiba Peveli, from a grid system based on latitude, longitude, and the alphabet, which had been invented by resident social reformer Stedman Whitwell. Feiba Peveli aligned itself philosophically with its parent Equality community, but its plan of government was based more closely on that of Macluria, with its power in the male members over the age of twenty-one. Both Feiba Peveli and Macluria were given property and the right to purchase said property under these specific conditions:

> That they should always remain communities of equality and cooperation in rights and property, and should not be divided into individual shares or separate interests. That any surplus property their industry might acquire must not be divided but used to found similar communities. And, that there should be no whiskey, or other distilled liquors made in the communities.

New Harmony's official organ, the *New Harmony Gazette,* reported on Robert Owen's reaction to the splinter communities: "The formation of communities is now pretty generally understood among us, and is entered upon like a matter of ordinary business. The same thing will probably occur throughout the country."

New Harmony in general and Robert Owen in particular—with his purported atheistic views—had become a favorite target of the clergy on both sides of the Atlantic. From every pulpit, the clergy continuously assaulted New Harmony's social system, inspiring one Duke of Weimar to visit New Harmony in April of 1826. The Duke was curious about the increasing unpopularity of Owen's ideas in the eastern United States. He spent enough time in New Harmony to realize that Owen's perceptions differed considerably from the perceptions of the community's rank-and-file members.

Robert Owen was convinced that all was proceeding according to plan and that his experiment would reform the whole world. In contrast, almost every community member with whom the Duke talked felt he had been deceived in his expectations. The Duke found that social classes were not mingling but, contrary to the egalitarian rhetoric, were remaining distinct. The Duke observed that those who considered themselves well-born resented the common labor they were required to do, and that the better-educated men fraternized together but did not mingle with those less educated.

Inside the community, the more vocal critics came from the working classes, while the upper classes enjoyed the novelty of association with others free from the conventions of society. For the young men of gentry, the informal access to the ladies of the community had its appeal. Robert Dale Owen commented,

> On the whole, my life in Harmony, for many months, was happy and satisfying. To this the free and simple relation there existing between youth and maiden much contributed. We called each other by our Christian names only, spoke and acted as brothers and sisters might; often strolled out by moonlight in groups, sometimes in single pairs; yet, withal, no scandal or other harm came from it. . . . I met almost daily, handsome, interesting warm-hearted girls; bright, merry, and unsophisticated; charming partners at ball or picnic.

Mental Independence

In spite of all the evidence to the contrary, Robert Owen continued to view the community with the rosiest perspective. July 4, 1826, marked the fiftieth anniversary of the signing of the *Declaration of Independence*, and on this date, Robert Owen delivered what he called the Declaration of Mental Independence in which he stated that man had been the slave to a trinity of evils: individual property, irrational systems of religion, and marriage founded on individual property. He followed this with a reiteration of the Principles set forth in his treatise, the *New Moral World*.

Members continued to become disenchanted, and other splinter groups continued to form. On July 30, 1826, a group by the name of the New Harmony Agricultural and Pastoral Society adopted a constitution modeled after those of previous splinter communities. Although Owen remained optimistic and willing to work with any and all groups that would form under his Principles, the New Harmony community continued to slide further into discord. After losing members to Macluria, to Feiba Peveli, and to the Pastoral Society, the Community of Equality had decreased to only about 800 members. Squabbles broke out between the different communities, who spent much time and energy wrangling with each other over boundaries and crop ownerships.

In May, William Maclure suggested that New Harmony be divided "into separate autonomous units

according to the occupation of its members." Owen agreed, and the society voted itself into three separate groups—the Mechanic and Manufacture Society, the Agricultural and Pastoral Society, and the Education Society. A lease was drawn that granted to William Maclure about 900 acres of land for the Education Society, which included the Hall of New Harmony, the steeple house, Community House No. 2, the Granary, and the Rapp mansion. Maclure had been the driving force in the educational movement in New Harmony, but differences were beginning to emerge between his vision and Owen's.

Maclure vs. Owen

Robert Owen believed that he and Maclure were partners, a position Maclure did not share. Maclure believed himself to be obligated only to the society's lease and an additional $10,000. During travels away from New Harmony for his health, Maclure wrote letters to New Harmony's teacher, Madame Fretageot, which indicated he was losing confidence in the Owen enterprise: "My experience at New Harmony has given me such horror for the reformation of grown persons that I shudder when I reflect having so many of my friends near such a desperate undertaking."

When Maclure returned to New Harmony in April 1827, Frederick Rapp was there to collect a $20,000 installment due on the property and to request the entire remaining balance of an additional $20,000, though it was not due for another year. Owen agreed, and he asked Maclure to pay his partnership share of $128,000, telling him that the balance of his [Maclure's] share of the indebtedness amounted to an additional $90,000. Maclure vehemently disputed this claim, but in the end, he agreed to pay Rapp the $40,000 in return for the bonds Rapp held against Owen, which made Maclure Owen's creditor.

Maclure posted signs around the area declaring he was not responsible for Owen's debts, and he filed suit in the circuit court to collect the money he had paid to Rapp. Caught by surprise, Owen posted his own notices declaring the partnership to be in full force, and then he, too, filed suit in the amount of $90,000. Arbitration led to a compromise wherein Maclure paid Owen $5,000, and Owen gave Maclure an unrestricted deed to the 490 acres operated by the Education Society for an additional $44,000.

Robert Owen had said he would sell land to anyone willing to live by his Principles, and more of the property began to fall into private hands as he sold parcels of land to those who promised to continue the experiment. According to Paul Brown, the resident dissident who exposed the shortcomings of Owen and his views in his pamphlet, "Twelve Months in New Harmony," the community was in a state of disarray with fences torn down, animals roaming loose, and tempers flaring everywhere, including a fist fight among the women. Owen fell victim to a swindle by a member, William Taylor, who pretended to be a disciple. As such, he was entitled by contract to 1,500 acres "with all thereon." The night before the contract went into effect, Taylor moved all the livestock and equipment he could find onto the property he was about to acquire. Against Owen's wishes, Taylor then set up a distillery. He also established a tannery to compete directly with the one in New Harmony.

On February 1, a day that Paul Brown called "Doomsday," a vote of the assembly expelled many members of the Community of Equality. On March 28, 1827, a *Gazette* editorial written by Robert Dale Owen and William Owen acknowledged the defeat of the experiment, while still affirming the principles of the general plan: "Our opinion is that Robert Owen ascribed too little influence to the early anti-social circumstances that surrounded many of the quickly collected inhabitants. . . . New Harmony therefore is not now a community." Writing in his autobiography, Robert Dale Owen closed the chapter on New Harmony.

> Thenceforth, of course, the inhabitants had to either support themselves or leave town. But my father offered land on the Harmony estate to those who desired to try smaller community experiments, on an agricultural basis. Several were formed, some by honest, industrious workers, to whom land was leased at very low rates; while other leases were obtained by unprincipled speculators who cared not a whit for cooperative principles, but sought private gain by the operation. All finally failed as social experiments.

Conclusion

Prolonged study of Robert Owen, the "Father of Cooperationism" and the New Harmony community leads us to the conclusion that Owen's failure at New Harmony perhaps lay in the very thing that brought him to America in the first place. Owen had hoped his ideas would flourish in America's environment of free thinkers and independent-minded people. However, the people on the American frontier in the 1820s did not take to the yoke so easily. They did not resem-

ble the working poor of the British slums who were already laboring sixteen hours a day for subsistence pay when Owen found them. Those workers developed gratitude and a loyalty for the changes he made to improve their lives.

On the American frontier, however, the true believers moved with the ne'er-do-wells, the misanthropes, the intellectual idealists, and the merely curious. It may have been that very independent, rugged individualism, so eloquently described by Alexis de Tocqueville, which contributed to Owen's failure. That, combined with Owen's apparent lack of interest in hands-on involvement in the community, leads one to wonder how it could not have failed.

Looking back more than 175 years, we can see that, in spite of the apparent failure of New Harmony, Owen's desire to create a new society was partially realized, as free, universal, and equal education was gradually institutionalized. Though change did not occur in the manner Owen intended, he might view these as partial successes and take pride in them.

Pentecostal Movement

One of the most dynamic and explosive religious movements in the twentieth century, Pentecostalism has revolutionized American religion. Pentecostalism, a form of Christianity, is typified by an excited worship style and experience, including speaking in tongues. The "baptism in the Holy Spirit"—an emotional experience that occurs after conversion often associated with speaking in tongues—distinguishes the faith of Pentecostals from that of other Christians. The movement has attracted followers from all races and classes, and appeals primarily to the middle and lower middle classes. From its beginnings with a few disillusioned evangelicals, Pentecostalism has spread into all branches of Christendom—only the Roman Catholic Church has more worldwide adherents.

The Pentecostal movement began during the late 1800s, a time of dramatic change in American religion. Traditional mainline churches were declining in number and influence while evangelical groups were on the rise. The radical evangelicals who would eventually launch Pentecostalism had four primary traits: they emphasized personal salvation experiences, they believed in the imminent second coming of Christ, they often sought and practiced divine healing, and they expected to have an emotionally charged, post-conversion experience called the baptism of the Holy Spirit. In Topeka, Kansas, one group of these evangelicals led by Charles Fox Parham believed that speaking in tongues, a gift that had appeared minimally throughout Christian history, was evidence of Spirit baptism. Accordingly, the group began to seek it. Parham claimed that on January 1, 1901, a woman began speaking in an unknown language after he had laid hands on her, an event that began the modern tongues movement and marks the origins of Pentecostalism.

A few years later, African-American preacher William J. Seymour, a convert to Pentecostalism and disciple of Parham, helped initiate the Azusa Street revivals in Los Angeles. These meetings, led and supported by an interracial group of blacks, whites, Asians, European immigrants, and Latinos, lasted almost three years and attracted Christians and curiosity seekers from around the country, many of whom experienced their own baptism in the Holy Spirit. Meetings were held in a decrepit old building that lacked the pretension of established churches while news of the revival was printed in the *Los Angeles Times* and in numerous small religious periodicals, including Seymour's *The Apostolic Faith*. Services were chaotic. Pentecostals believed that the Holy Spirit should control the direction of the meetings; therefore, they had no formal, organized service order or explicit leadership. Men and women prayed, preached, exhorted, spoke in tongues, wept, trembled, and convulsed as they believed that the Spirit dictated. Azusa Street converts returned to churches located around the country to initiate new Pentecostal meetings.

Powerful charismatic leaders, who often had little formal education, popularized the movement. Following his return from the Azusa Revival, African-American Holiness preacher Charles H. Mason gave the newly established Church of God in Christ (COGIC) a Pentecostal emphasis. A popular leader among whites and blacks, he built COGIC into the nation's largest Pentecostal denomination. COGIC's emphasis on gospel music, and its many talented artists, helped Pentecostalism engage with the broader American culture and contributed to its growth. The most famous Latino Pentecostal preacher and faith healer, Francisco Olazabál, worked within a number of established denominations and also contributed to the birth of at least ten Pentecostal denominations. In Texas, California, Puerto Rico, and around North America, he converted tens of thousands of Latinos to the Pentecostal faith, helping spark the tremendous expansion of Latino Pentecostalism. But no individual leader had as significant an influence as Aimee Sem-

ple McPherson. Joining the movement in 1907, by the late 1910s McPherson was traveling the country spreading the message of Pentecostalism. Young, intelligent, and a gifted speaker, McPherson became a popular figure both in small towns and in the nation's burgeoning metropolises among all races, ethnicities, and classes. Her theatrical panache and dramatic sermons drew tremendous crowds. She encouraged her many converts to share their Pentecostal experiences with their local churches, regardless of denomination. When she decided to settle down in Los Angeles in the 1920s, McPherson did not build a traditional church but instead erected a theater-like building, the Angelus Temple, in which she staged elaborate productions, with ornate sets, live animals, and full orchestration to illustrate her sermons. She also built her own radio station, which became one of the most popular in the city. Despite these accomplishments, McPherson is probably best known as the founder of the International Church of the Foursquare Gospel. Following McPherson's lead, Pentecostals have often appropriated new technologies, such as television stations and broadcasting satellites, to proselytize.

In 1914, Pentecostal leaders from all over the nation gathered in Hot Springs, Arkansas. They did not intend to start a denomination, but hoped to develop Pentecostal schools and to solidify their evangelistic programs in order to keep the movement growing. This meeting resulted in the creation of the Assemblies of God, the denomination currently with the largest worldwide membership. One of the keys to their growth, as was the case in many other Pentecostal sects, was the institution of a successful publishing house that advertised meetings, publicized the movement's success, and inculcated followers with Pentecostal theology. The Assemblies' missionary work has also been crucial to their growth. Churches sponsor representatives who travel overseas to share the Pentecostal faith in new cultures, while preachers strongly encourage their parishioners to engage in personal evangelism with their acquaintances.

Pentecostalism did not grow as rapidly between the 1920s and 1950s as it did in previous decades. The movement experienced a rebirth and dramatic expansion in the 1960s, called the "Charismatic Renewal." Although Pentecostals always sought inroads into established denominations, in 1960 Dennis Bennett of St. Mark's Episcopal Parish, in Van Nuys, California, informed his "respectable" congregation that he had spoken in tongues and believed that other Christians should seek a similar experience. Bennett eventually resigned, but his confession symbolized the start of a wave of Pentecostal activity in older, more traditional Protestant churches as well as in Catholic circles around the country. Pentecostal practices and beliefs were no longer a monopoly held by radical evangelicals, but penetrated Christian institutions everywhere.

Pentecostalism is a social movement organized around intense religious commitment. Adherents have relatively unique spiritual practices and a dedication to a particular, somewhat narrow, creedal ideology. Charismatic leaders, strong institutions, the appropriation of modern technologies, and fervent proselytization has made the Pentecostal movement one of the most important of the twentieth century.

Colorado Cooperative Colony Movement

Following the Civil War, a combination of social, economic, and legislative forces gave renewed impetus to the colonization movement in the United States. The industrial revolution and the unregulated capitalism that accompanied it produced cities that many pronounced increasingly unfit for human life, but in the steel tracks and the steam locomotion of the railroad, industry also produced the means for escape. Wars, treaties, and a subsequent series of legislative acts made Western lands more accessible and able to be irrigated. Digging an irrigation canal was not a task a person could accomplish individually, so many of these post–Civil War colonies were founded on cooperative or socialistic principles. Not only practical, cooperative/socialistic colonies also offered alternatives to greed, poverty, and other social problems believed to have been created by industrial capitalism. To fund their ventures, the founders of these colonies often organized as joint-stock companies. Several such colonies appeared throughout the West, in Utah, California, Washington State, and Colorado.

Similar to many of the colonies established during the latter half of the nineteenth century, one in Colorado began as the idealistic dream of a few people. These people desired to create a community where, according to their Declaration of Principles, "Man's first and greatest duty, care and thought should be to advance the common interests of the community." This colony organized, as did others of the period, as a joint stock venture. Its name was the Colorado Cooperative Company, and its primary task was to construct an irrigation ditch. Nearly every day for ten years, the courageous colonists of the Colorado Cooperative Company labored to build their thirteen-mile ditch, erecting an 840-foot-high trestle (the world's highest at the time) in the process, while struggling to hold their socialistic community together in the Colorado Rockies.

Formation

Neither wealthy nor destitute, members of the Colorado Cooperative Colony described themselves as eclectic and intelligent. Without a doubt, they were reflective thinkers who sympathized with social reformers and were not afraid to criticize the status quo. Early in their community life, they established a library, and, after ten hours of heavy labor on the ditch, their favorite evening activity was to perch on hard benches and read by flickering oil lamp. They formed a literary club and a drama club, and no community celebration was complete without readings, performances, music, and dancing. Above all else, they shared a passion in the belief that cooperative living would solve the ills of society, a belief to which they were so committed that they were willing to uproot their families and sacrifice comfort and even food to pursue it in an isolated spot in the mountains of Colorado.

On February 16, 1894, the Colorado Cooperative Company (CCC) incorporated with a capital stock of $100,000—1,000 shares with a par value of $100 each. Five of the seven members/stockholders who signed the Articles of Incorporation on that day were Colorado State Senator B. (Benjamin) L. Smith; Colorado State Farmers' Alliance organizer and former president of that group, J. (Jake) H. Brammeier; soon-to-be elected Colorado State Senator F. (Frank) E. Moody; Colorado State Fish Commissioner W. (William) R. Callicotte; and Judge P.A. Simmons.

Article V of the Articles of Incorporation designated the first board of directors of the CCC as the seven people who signed the articles, plus two others—J.S. (Joe) Bartow of Denver and Colorado State Engineer C.B. Cramer. The articles charged these nine people with responsibility for managing company affairs for the first year of its existence. Although they did not sign the Articles of Incorporation, nor were they listed among the first board of directors, four other names should be included among those of the

founding members: T. (Truman) O. Smith, C. (Charles) E. Smith, F.H. Nye, and Ezra Simmons.

Born in Canada, B.L. Smith attended public schools in Michigan. He worked in the mining business in Idaho before being elected a senator of Colorado in 1890 on the Independent-Populist ticket. Smith's term as senator expired in 1894, about the same time he became the first CCC member to move with his family to Naturita, Colorado. His brother, T.O. Smith, was the second resident of the colony. They were soon joined by colonists arriving from Denver, Iowa, Kansas, New York, Minnesota, and a colony in Topolobambo, Mexico. By March 1895, forty-one people lived "on the ground," as colonists termed it, at the colony site in or near Pinon, Colorado; by November 1896, that number had more than doubled to eighty-six.

Principles of the Colony

The Articles of Incorporation stated the purposes of the company, which, along with constructing ditches, included sanitation, education, and entertainment. They determined the number of shares and the value of each, and, in accordance with the founding members' belief in cooperation, they dictated that every member, regardless of the number of shares of stock owned, was entitled to one and only one vote.

It is clear from the Articles of Incorporation that the founders knew what they wanted. They also knew what they did not want. Shortly before they incorporated, a lengthy and detailed article about Colorado appeared in the *Harper's New Monthly Magazine.* The author, Julian Ralph, described another Colorado colony, that of Greeley (founded by newspaperman and social reformer Horace Greeley), as ideal because the colonists themselves owned both the land and the means to irrigate it. This was not the case everywhere. In some colonies, the colonists were at the mercy of corporations and speculators who charged increasingly higher prices for water and canal maintenance. The founders of the Colorado Cooperative Company were determined to keep their community out of corporate clutches. Favoring ideals of cooperation and fervently opposing the mercenary aims of large corporations, they established a structure by which members, not an outside corporation, would build the ditch; they would pay for it with their labor, and they would own the ditch and the water it carried into perpetuity.

Locating the Colony in Colorado

After incorporating, the company sent one founding member—B.L. Smith—to find the ideal location for the cooperative colony. Prospective colonists could file for their land under either the Preemption Act or the Desert Land Act. Because the Desert Land Act required that land be irrigated before homesteaders could receive a patent, the CCC site would have to be fairly level and lie near a water source that would provide water year round. Article XII of Colorado Cooperative Company by-laws allowed members enough water for up to 40 acres each. To accommodate a town site and 40 acres for 1,000 members, the site would have to encompass approximately 40,000 acres.

Colorado was already becoming famous for its fruit, and the CCC founders planned orchards for their own use, as well as for export. Therefore, the colony site could not be too isolated—no more than a couple days' travel from a railroad. If they were to grow fruit, the climate had to provide an early frost-free date, plenty of sunshine, and a long growing season. And the soil, of course, had to be fertile once it was watered—not alkaline, nor too sandy, nor full of clay. Ideally, they should locate near some mining operations so that they would have a ready market for their agricultural products. The site had to possess ample stone and timber for building, and plenty of coal for fuel. Finally, if people were going to live out their days in this place and then leave it to their children and perhaps to their children's children, it had to be beautiful.

While recuperating in Placerville, Colorado, from an illness contracted during his travels, Smith heard of a mesa along the San Miguel River. Smith found this mesa, called Tabeguache Park, 50 miles from the Denver and Rio Grande station branch of Placerville. Situated on the western slope of the San Juan Mountains, it appeared fairly flat. The first issue of the company/colony newspaper, the *Altrurian,* described the site as possessing "rich land, ample water for irrigation and domestic purposes. The finest building stone in the world lying in strata from one inch to two feet in thickness . . . also coal not far away, and timber for fuel for an age." Smith determined that the climate would be conducive to the agricultural and fruit-growing endeavors the company planned.

Such a majestic land inspired grandiose dreams. The second issue of the *Altrurian* claimed: "We sincerely believe that there will yet spring up in some valley of the west a grander civilization than this world has ever known. Who will say that the Colo-

rado Cooperative Colony is not the nucleus of such." They had found their Eden, but to make it bloom, they had to get water to it.

Means of Formation

Build a Ditch

The mesa, where they planned to build their homes, lay 300 feet above the San Miguel River. Getting water to the mesa would require building a ditch approximately 13 miles in length. The founders knew that building this ditch would not be easy. They recognized the need for manpower, surveyors, and a ditch engineer. They recruited assistance from W.H. Porter, the man who superintended the construction of the cooperative ditch in Sinaloa, Mexico (Topolobampo Colony under Albert. K. Owen, 1871). Porter was asked by CCC founder and Superintendent B.L. Smith to share his ideas on cooperative ditch work. In the second issue of the *Altrurian,* Porter advised the CCC to follow sound business principles:

> All members should be stockholders with equal voice in the selection of a board of directors who should have the full power of authority to carry out the line of work agreed upon to be done. . . . The membership should always retain the right to recall (imperative mandate) the board management . . . but the membership should render obedience to said management until it was recalled.

Porter lauded the ideals of cooperation, but his experiences with A.K. Owen's colony in Mexico had made a realist of him, and he cautioned the CCC that humankind might not be ready for cooperation.

Cooperation

Membership in the CCC required a minimum deposit of $10 and payments of at least $5 per month until the $100 for the share of stock had been paid in full. Similar to the Anaheim Colony in California, some of the CCC members would live on-site to construct the ditch. Their labor would purchase their stock shares and their water rights. The rest of the members, residing outside the colony, would continue making monthly cash payments for their stock and water rights.

The first estimate of the cost of the ditch was $100,000 in labor and materials. Although the labor did not require cash, the equipment and supplies did. The plan depended on selling 1,000 shares of stock for $100 each, and that required members. Two main strategies were employed to recruit these members. One was the publication and national circulation of the company/colony newspaper, the *Altrurian*. The other was the establishment of at least five CCC clubs around the country. Members of these clubs were CCC stockholders, and they had a single purpose—to recruit more members. As stated in the Declaration of Principles, cooperation of all the members would bring success:

> We affirm that only by and through co-operation, viewed from a social and business standpoint, can we reach the highest condition of social and intellectual attainment, and material equality.

As events unfolded over the next seven years, the CCC encountered many problems that W.H. Porter had warned them of. In particular, a few members refusing to "render obedience to management" threatened the colony's founding values; not instituting the "imperative mandate" from the beginning resulted in dissension; and failure to "act as one body or organism" practically destroyed the colony.

Goals and Purposes of the CCC

Conforming

In the addenda to the Declaration of Principles, the founders of the CCC summarized what they wanted to do and how they planned to accomplish it. These people were not Luddites opposed to technology; rather they welcomed technology for its labor-saving potential. However, they considered debt, interest, and rent the special evils of capitalism and so resisted them as means to build their ditch. The CCC founders believed in cooperation, but not to the exclusion of all individual rights; that is, they distinguished between democratic cooperation, or democratic socialism, and communism, and this distinction created problems when some communistic members attempted to gain control of the company.

During the months following the signing of the Articles of Incorporation, the original founders drafted a constitution and by-laws for the Colorado Cooperative Company. The by-laws were first published in January 1895 in Volume I, No. 1 of the *Altrurian* with this claim, "when experience proves them impractical they will be changed."

As reported in the March 1895 issue of the *Altrurian*, the new board of directors reported the first year's accomplishments, which included increased membership from twelve persons to forty-one; an in-

A team of surveyors belonging to the Colorado Cooperative Colony takes a break from their efforts to construct a thirteen-mile irrigation ditch in the 1890s. The colonists' goal was to bring water to a mesa called Tabeguache Park, where they hoped to establish a socialistic utopian community. *(Courtesy, Rimrocker Historical Society)*

vestment of over $1,000 in cash, livestock, and tools; and 203 days' labor in hauling lumber, building cabins and stables, and temporary ditch work. During their second year, the CCC conducted surveys on the ditch, purchased equipment for and began a sawmill, planted crops, built roads, completed a small ditch to water annual crops, built houses, and continued to recruit and gain additional members—including two babies born to colony members.

By the end of year two, the leadership planned to relocate the *Altrurian* from Denver to Naturita and to publish weekly rather than monthly. A total of eighty-six members voted at the annual meeting held in Naturita in January 1896. All eighty-six had signed the Articles of Agreement, which bound them to abide by the constitution and by-laws and to "respect the orders and instructions of all lawfully elected or appointed officers . . . while in the discharge of any . . . business or government of the affairs of said Company."

Difference of Opinion

B.L. Smith addressed the stockholders at the annual meeting of 1896. In this address, Smith referred to some grievances "born of jealousy," and he warned the body to "proceed carefully with consideration." An article in the February 1896 edition of the *Altrurian* entitled "Lessons on Keweah" provided a thinly disguised warning to some CCC members when it listed several of the Keweah Colony's problems, which editors identified as "unequal yoking," internal discord, and acceptance into the colony of members who were incompetent or unfit. The trouble at Keweah, according to this article, was "not in the system or ideas, but in the people . . . the struggle is not chiefly economic, but essentially moral." The April issue quoted CCC member C.E. Smith as saying, "If there are members who cannot subject themselves to the directions of the manager then they have made a mistake joining the Colony, for it is to be managed by one man."

The difference of opinion erupted in April 1896

and resulted in the expulsion of ten members. Resident members approved this action on May 2 by a vote of 24 to 2. Comments in the May issue of the company organ revealed that expelled members had preferred communism over cooperation and had threatened CCC management and by-laws:

> The Colorado Cooperative Company is a corporation chartered under the laws of Colorado. It is not communistic as the term is understood—nine-tenths of the stockholders believe in the private ownership of a limited amount of land. They believe that those who cultivate the soil should own it. They don't believe the people are ready to own land in common if they ever will be.

The CCC had survived its first internal threat and had emerged with its founding values not only intact but strengthened.

Onward

Now that the threat was behind them, CCC members could afford the luxury of turning some of their attention outward, toward the presidential campaign, for example. William Jennings Bryan was running for president of the United States on the Populist ticket. With their founders involved in the Farmers' Alliance, and with a collective belief in the advantages of cooperation over the "evils" of capitalism, it is not surprising that they favored Bryan. The CCC made their opinions known through the *Altrurian*, referring to Bryan as "champion of the common people, that intrepid foe of corporation greed, that splendid young statesman." The paper told its readers that choosing Bryan over McKinley was choosing the common people over the wealthy.

CCC members also turned their attention to the future, to their ideal community, which some were now calling "Ingleside." Plans included a CCC university that would provide summer study of the geology and the flora and fauna of the western slope of Colorado, as well as anthropological studies, as described in the colony paper, "homes of a vanished nation . . . the cliff dwellings of Mancos." The community would provide "fair labor for all, drudgery for none, healthful recreation, good fellowship, kindliness, charity, and friendship." A jointly owned and operated electric rail, along with no horses, no coal, no ashes, and no factory or kitchen fires would assure clean streets and clean air. In anticipation of a library, they established a reading room and requested outside members to send books and magazines.

In October 1896, the *Altrurian* moved its operations from Denver to Naturita, and in November it published a census of on-site members that revealed a total of eighty-six persons—forty men, eighteen women, and twenty-eight children—residing at Naturita, Pinon, or one of the temporary camps of Sawmill, Cottonwood, or Riverside. By the annual meeting in January 1897, there were a total of 197 members in good standing; the company was out of debt, with $250 after all bills had been paid, and there was "enough flour on hand to last half a year, [and] beef and pork to last two weeks."

Storming the Seat of Power

Subscribing to a common philosophy of cooperationism was no guarantee that all CCC members would agree with everything other members or management did. Intelligent, well read, and opinionated, they had accurately characterized themselves as "eclectic" in the addenda to their Declaration of Principles. The annual meeting provided a time and place where members could make their grievances and arguments known by amending the by-laws and by electing new officers.

On January 3, 1897, shareholders voted on changes that nudged the seat of power further from the board and closer to the members. The original addenda was replaced by a completely new one, which pinpointed the crux of the problem that was to plague the CCC for the rest of its existence. Ironically, for a group of people who hated capitalism and who committed themselves to the ideals of cooperation, their major problem was money, as indicated by the new addenda:

> The number of men, who can be profitably employed by the Company is limited by the amount of money coming in from outside members. No cash is paid for work, but cash must be paid for food, tools, etc. What is most needed now is a large outside membership of self-sustaining workers who will send in regular monthly payments. . . .

The Colorado Cooperative Company/Colony began its fourth year of incorporation in January 1897. A special meeting that year, held in Pinon on May 1, finally resolved the issue, outlining a procedure of removing members of the board of directors under terms of the Imperative Mandate, a state constitutional amendment directing the state legislature to enact an eight-hour law for workers employed in mines, mills, smelters, and blast furnaces.

Money Problems

Although resident members were dependent on outside members for the cash they needed for supplies and equipment, the outside members did not feel the same dependence on the colony residents for attaining their mutual goal, and they did not send the needed cash to support the workers and their efforts on-site. The *Altrurian* published numerous pleas to outside members to make their promised cash contributions, including one by newly elected President T. O. Smith, in which he explained the difficulty of operating with an unpredictable cash flow. Smith reminded members of a new by-law, adopted at the previous annual meeting, that permitted the CCC to sell shares of stock when payments were not made, and he appealed to their desire for irrigated home sites to induce them to honor their financial commitments to the colony.

Unsure of the cash contributions from outside members, the board called for a year-long halt to any more families moving to the colony. In late August 1898, the board began issuing coupon books to families to use when purchasing supplies from the store or other departments. The system was designed to save time, thus cost, involved in keeping track of purchases.

Faced with increased debt and decreased supplies, continued hard work, and insufficient support from the outside, members began to find fault in several areas, including the board of directors, leveling criticisms at them for costing the company nearly $2 per hour to meet every week for what some considered to be trivial matters. In February 1899, former CCC president C.H. Robinson observed that the 28 percent of the membership who lived on-site had contributed 85 percent toward the completion of the ditch, while the 72 percent of the membership who lived outside the colony had contributed only 15 percent toward their mutual goal. By March, Robinson proposed the unthinkable—bonding the ditch.

Controversy

Controversy over two issues—bonding the ditch and implementing a self-sufficiency plan—eventually resulted in half of the board members submitting their resignations in April 1899. When he tendered his resignation, President T.O. Smith said he hoped this action would "unify the Stockholders of the company and promote harmonious action among the workers on the ground and the paying members on the outside."

Notice of the annual meeting of 1899 appeared in the June 7 *Altrurian*, and as had been characteristic of every other annual meeting, trouble was brewing. Twelve members of the Denver Club had sent a letter to the board of directors notifying them that, according to the Articles of Incorporation, the annual meeting should be held in Denver, not in Pinon, where it had been held since January of 1896. In response, the board decided to amend the Articles of Incorporation, an action that would require a two-thirds vote of the stockholders to ratify.

Before the Fourth of July celebration, the issue of where to hold the annual meeting landed in the hands of attorneys. Plaintiffs Charles E. Smith, George E. Wright, and George B. Ruggles sued on behalf of themselves and all other stockholders of the Colorado Cooperative Company. They claimed that the Articles of Incorporation did not provide for any location for the annual meeting except Denver, and they requested an injunction to prevent holding it anywhere except Denver. The *Altrurian* accused the Denver members of scheming to disenfranchise on-site members by forcing them to vote only in Denver, a trip most workers could not afford to make. On July 7, 1899, in District Court of Arapahoe County in the State of Colorado, Judge Frank T. Johnson refused to grant the injunction and ruled that the board of directors could decide where the annual meetings should be held. He told them to "go to the annual meeting at Pinon and fight for their alleged rights there."

Not enough votes were cast at the annual meeting held at Pinon on July 22, 1899, to decide the location of the company headquarters. It was not until three additional votes had transpired that the annual meeting of July 4, 1900, determined, with 192 voting for and 76 against, that "the principal office of the company within said state of Colorado, shall be located in Pinon, Montrose County. Other offices may be established elsewhere, where the Company may have interests as may be provided by the By-Laws."

Water Rights

For the next several months, articles and letters in the *Altrurian* reflected concern over water rights. The cost of a water right would equal the cost of the ditch divided by the number of members who had paid for the water, which made estimating the cost per member difficult. Members were warned repeatedly that water rights could be purchased only before the ditch was complete; after the water was on the land, no water rights could be purchased at any price. Outside members were encouraged to send payment for their

water rights—$5 per month from each outside member would support more workers to complete the ditch.

Though expert opinion indicated that the Colorado land with water rights attached would be worth as much as $900 per acre, the appeals for payment were ignored. By January 1901, B.L. Smith reported that only eighteen outside members had paid anything on their water rights, averaging only $3.99 per month, and at that rate, it would take over nine years to pay for enough water for 40 acres. He made a last appeal to outside members to make regular and sufficient payments on water rights. Smith also proposed borrowing $10,000 at 6 percent for five years to complete the ditch, and the board further proposed creating a separate ditch company.

Reforming

June 6, 1901, marked the last publication date for the *Altrurian*. That issue began with a notice to stockholders that outlined the options to be voted on at the July 4 annual meeting. Members' options included reorganization or dissolution of the Colorado Cooperative Company, or segregation of the company's ditch and water rights. The second option provided for the organization of a new and independent company to construct and operate the ditch. At the annual meeting, members ultimately decided on two major changes in policy. First, they would convert all water credits into common stock at par, which necessitated increasing capital from $100,000 to $150,000. Each share would be entitled to a pro rata share of water in the ditch, as well as to a vote in the proceedings of the company. Second, they decided to contract the remaining ditch construction, with qualified CCC members to be considered for these contracts.

So, work on the ditch continued, though not under the same cooperative structure envisioned by the founders over six years before. The egalitarian spirit behind the "one man, one vote" principle faded, along with the publication of the *Altrurian*.

More colonists, including many former nonresident members, arrived in Pinon between 1902 and 1904, making it the second largest town in Montrose County. After six and one-half years of discussion about the town plan and what its name should be, residents decided on the name Nucla, from the Latin word for nucleus, because they hoped it would become the "center of Socialistic government for the world." They formed the Town of Nucla Improvement Company with a capital stock of $50,000 divided into 5,000 shares with a par value of $10 per share. Each share of stock entitled the owner to a "99-year lease to one business lot or two residential lots, 42 by 200 feet, no person to hold more than one block or twenty lots."

The 1901 annual meeting also established May 1904 as the deadline for completing the ditch. Workers came within thirty days of meeting this deadline, and water flowed through the ditch on June 4, 1904. Colonists celebrated the feat on July 4 by caravanning from Pinon along the ditchline road in company wagons, on horseback, and on foot to a picnic at the town site on the mesa. While colonists had reason to be joyous, they celebrated without their original founders. Only one of the charter members of the CCC stayed to see the completion of the ditch and to build a home on the park. That was Ada McElroy, of Denver, who had taught at the Pinon school for a while. Before that, in the summer 1895, she and her brothers H.E. Robinson and T. (Tom) W. McElroy exhibited their adventurous spirits by bicycling from Montrose, Colorado, over the Uncompaghre Divide to the Pinon Camp. This bicycle ride may have embodied the spirit of all the CCC founders, but for a variety of reasons, including discouragement, changes in policy, and irresolvable differences of opinion, one by one, they each decided to pursue different dreams.

With the founders went the original cooperative principles, and Nucla gradually evolved into the quiet, rural town it is today. The reformed Colorado Cooperative Ditch Company accomplished what it had intended to do: it brought the water that was needed to create a community. It continues to supply water to Tabeguache Mesa into the twenty-first century.

Homeopathy Movement
1870–Present

The initial growth of homeopathy coincided with the decline of the well-established professional class of "regular" physicians in the 1830s. As the public demanded that anyone be allowed to work as a healer, orthodox practitioners lost their privileged position and political power. Advocates of homeopathy became part of a group of dissident medical practitioners, referred to as "sectarians" by their orthodox counterparts. The sectarian challenge, reflecting public appeals for alternatives to an overly invasive and increasingly monopolistic orthodoxy, subsequently shaped both the structure of the profession and the approach to medical practice throughout the nineteenth century.

The Danish physician Hans Gram first brought homeopathy to the United States in 1825. Rising to the position of president of the Medical and Philosophical Society of New York in the early 1830s, he converted a group of prominent practitioners, who then spread homeopathy throughout neighboring states. By 1835, the Swiss physician Henry Detwiller and German physician Constantine Hering established the first homeopathic academy in Allentown, Pennsylvania. Hering, known as the father of American homeopathy, was instrumental in creating America's first national medical society in 1844, the American Institute of Homeopathy. By the time Hering obtained a charter for the Homeopathic Medical College of Pennsylvania in 1848, homeopathy represented a major source of competition for orthodox medical practitioners.

American medical orthodoxy emerged from the Enlightenment quest for a rational medical science. The orthodox approach, however, was largely empirical and based on counteracting the forces of nature. Their vehement opposition to the idea that nature had its own healing powers often distinguished practitioners of regular medicine. Prominent physicians like Philadelphia's Benjamin Rush were committed to direct and drastic interference in the patient's system. Believing that health is a function of the interaction between a person's constitution and the physical environment, physicians made dramatic efforts to stimulate and reinvigorate the patient.

Utilizing powerful substances like opium, mercury, arsenic, and strychnine, orthodox therapies earned the name of "heroic" medicine. For most ailments, orthodox physicians practicing during the period from the 1780s to the 1850s advocated bleeding, blistering, purging, and sweating. They often combined extensive bloodletting with the administration of massive doses of dangerous drugs designed to cleanse the system. As disease was defined as loss of equilibrium in the interaction between the individual and the environment, medicine amounted to a set of procedures designed to regulate bodily fluids. Consequently, few disease-specific therapies existed. Medical educators of the early eighteenth century advocated massive bleeding, for example, as a cure for a variety of ailments. The release of several ounces to several pounds of blood was prescribed to reduce inflammation, relieve congestion, alleviate pain, relax muscles, and stop hemorrhage. Physicians also prescribed calomel, the most widely used drug in the first half of the nineteenth century, indiscriminately. When calomel, containing the chloride of mercury, would break down in the intestines into its poisonous components, it served as a violent laxative, producing effects consistent with the system of orthodoxy. While some physicians doubted such harsh therapeutics, the average patient continued to insist upon receiving the treatment that was currently most popular.

Homeopathy entered a largely unregulated medical marketplace created by the political forces of Jacksonian democracy. A popular distrust of the wealthy, elite, and well educated made professional medical societies one of many targets. For the individual physician, membership in orthodox societies represented

distinction, prestige, and a license to practice. For the individual seeking alternatives to orthodox treatment, the medical society represented a monopoly. Responding to the equalitarian spirit of the times, state after state repealed laws governing licensure. While this opened the practice of medicine to virtually anyone, including quacks and outright frauds, advocates of deregulation saw diversity in medical practice as a counterpart to religious plurality.

Samuel Hahnemann and the Foundations of Homeopathy

The roots of homeopathy can be traced to German physician and theorist Samuel Hahnemann, a physician who left medical practice due to his disillusionment with heroic therapies. His work as a writer and translator of medical texts, however, ultimately led him back to practice and changed the history of medicine. While translating a treatise on medical treatments by Scottish physician William Cullen, Hahnemann included a footnote disputing Cullen's explanation for the effectiveness of cinchona bark in treating malaria. Cullen maintained that the bitterness and astringent quality of the bark confronted the fever and malaise. Hahnemann suggested another explanation was necessary because other substances decidedly more bitter and astringent were not effective in treating malaria. In an effort to understand the effects of cinchona bark on the body, Hahnemann took repeated doses of the herb until his body responded. He experienced the same fever, chills, headaches, and other symptoms of malaria. Consulting Hippocrates for an answer, Hahnemann concluded that the herb was effective because it caused symptoms similar to those of the disease it was treating. For Hahnemann, this meant the drug that caused illness in a healthy person would cure that same illness in a sick person. This founding principle, which he termed *similia similibus curantur*, or "likes are to be cured by likes," became the cornerstone of homeopathic doctrine.

In direct opposition to the excesses of heroic medicine, homeopathy was organized around a second fundamental principle—that diseases were curable by small doses of particular drugs. Hahnemann's "doctrine of infinitesimals" suggested that the greatest therapeutic benefit came from diluted doses. While regular physicians had no firm theoretical basis for attacking Hahnemann's "like is cured by like" principle, the idea of diluted doses provided an opportunity for orthodox followers to denounce homeopathy as nonsensical and therapeutically ineffective. For the patient, however, small doses prevented the damaging effects of heroic therapies. Offering an alternative to traditional orthodox practice, homeopathy gained a substantial following among doctors and patients as a safe, effective, and relatively inexpensive form of therapy.

Homeopathy also owed some of its popularity to its philosophical appeal, especially for Transcendentalists and others who had become disillusioned with the rigid materialism of Enlightenment rationality. Hahnemann provided an implicitly spiritual or metaphysical view of healing with references to the "spirit-like" activity of some medicines. He suggested that homeopathic remedies enabled an inner vital spirit to combat illness. This modified form of vitalism required a belief in the interrelationship between the spiritual and material provinces.

In 1810, Hahnemann published these ideas in his most important work, the *Organon of Homeopathic Medicine*. The following year, the first volume of his *Materia Medica Pura* included a guide to the medicines he tested and described based on the symptoms they caused. These "drug provings" provided a system of medical practice based on the law of similars. Hahnemann claimed that orthodox practitioners prescribed drugs not on the basis of *contraria* (drugs opposite in reaction to the symptom), or *similia* (like the symptoms), but *allos*, meaning another basis of prescription. Intended as a derogatory designation, the term *allopath* was soon commonly applied to the regular profession.

The Sectarian Challenge to Orthodoxy

Homeopathy was part of a much broader movement that challenged the legitimacy of orthodox practice. The first widespread challenge to regular medicine came from the son of a struggling New Hampshire farmer, Samuel Thomson. Thomson developed his own theory that illness was an imbalance of bodily constituents, normally the result of cold. According to Thomson, curing any disease involved restoring bodily heat by clearing obstructions and providing nourishment from stimulants. Although this was not dramatically different from the orthodox approach to restoring equilibrium, Thomsonians limited therapeutic intervention to herbs and intense steam baths. Thomson quickly enjoyed success as a healer and incurred the jealousy of orthodox practitioners. His motto of making every man his own physician coincided with the prevailing democratizing force of Jack-

HOMEOPATHY AND ITS KINDRED DELUSIONS

Oliver Wendell Holmes

German physician Samuel Hahnemann developed the idea of homeopathy in the late eighteenth century based on the notion of using natural cures for the treatment of physical and mental illness. Homeopathy continues to have millions of resolute adherents who believe the method is more effective than conventional medicine in treating their symptoms. The following document, first presented in lecture form in 1842, is a critique of homeopathy by U.S. Supreme Court justice Oliver Wendell Holmes.

It is necessary, for the sake of those to whom the whole subject may be new, to give in the smallest possible compass the substance of the Homeopathic Doctrine. Samuel Hahnemann, its founder, is a German physician, now living in Paris, at the age of eighty-seven years. In 1796 he published the first paper containing his peculiar notions; in 1805 his first work on the subject; in 1810 his somewhat famous "Organon of the Healing Art"; the next year what he called the "Pure Materia Medica"; and in 1828 his last work, the "Treatise on Chronic Diseases." He has therefore been writing at intervals on his favorite subject for nearly half a century. [Hahnemann died in 1843.] . . .

Does Hahnemann himself represent Homeopathy as it now exists? He certainly ought to be its best representative, after having created it, and devoted his life to it for half a century. He is spoken of as the great physician of the time, in most, if not all Homeopathic works. If he is not authority on the subject of his own doctrines, *who is?* So far as I am aware, not one tangible discovery in the so-called science has ever been ascribed to any other observer, at least, no general principle or law, of consequence enough to claim any prominence in Homeopathic works, has ever been pretended to have originated with any of his illustrious disciples. He is one of the only two Homeopathic writers with whom, as I shall mention, the Paris publisher will have anything to do with upon his own account. The other is Jahr, whose Manual is little more than a catalogue of symptoms and remedies. If any persons choose to reject Hahnemann as not in the main representing Homeopathy, if they strike at his authority, if they wink out of sight his deliberate and formally announced results, it is an act of suicidal rashness; for upon his sagacity and powers of observation, and experience, as embodied in his works, and especially in his Materia, Medica, repose the foundations of Homeopathy as a practical system.

sonian America and the belief that the individual could do anything he desired.

Homeopathy presented a much greater professional and economic threat to orthodox practitioners. Whereas Thomsonians operated outside the orthodox medical system, homeopathic practitioners often graduated from orthodox schools and subsequently defected from the ranks of regular physicians. Many homeopaths made a concerted effort to convert established physicians. Strong proselytizing efforts distinguished homeopathy from all other medical sects. Furthermore, although Thomsonianism tended to appeal to rural and poor clients acquainted with traditional herbal remedies, homeopathy flourished among the urban upper class. Homeopaths were generally well educated and carried the reputation of patronage by the aristocracy and social elites of Europe. As a result, homeopaths brought direct economic competition to the regular system.

The most effective denunciation of homeopathy came from the famous physician, poet, and medical educator Oliver Wendell Holmes in 1842. Presented as two lectures for the Boston Society for the Diffusion of Useful Knowledge, the classic assault on "Homeopathy and Its Kindred Delusions" was later published widely. Holmes disavowed the miraculous curing power of homeopathy by placing it in the same category as other medical delusions, including the legendary cure for a form of tuberculosis allegedly provided by the royal touch of the King of England. While Holmes found that the law of similars had some validity, he ridiculed homeopaths for the doctrine of minute doses and Hahnemann's drug provings. Holmes admitted, however, that the real problem with evaluating the merits of homeopathy was that the vast majority of patients recovered under any system. In an admission that seemed equally damning to the regular profession, and a pronounced retreat from heroic medicine, Holmes asserted that 90 percent of the cases commonly seen by a physician would recover if nothing interfered with the power of nature. Regardless, Holmes predicted homeopathy

would ultimately fail once its novelty wore off and its failures increased.

Surprisingly, the homeopathic influence in the abandonment of heroic therapies was made especially clear by the 1951 Fiske Award of the Rhode Island Medical Society, given for the best attack on homeopathy. In "Homeopathy, So-called, Its History and Refutation," Worthington Hooker skillfully used mathematics to demonstrate the absurdity of the theory of infinitesimals, while resorting to logic to disprove the claim that the law of similars was the only "law of cure." Yet, Hooker recognized that homeopathy had demonstrated that the healing power of nature could be even stronger than heroic practices. Hooker announced that regular medicine must learn to harness that power. He maintained that it was in this way that the most absurd of all medical delusions might still do service to the cause of science and humanity.

The American Medical Association and Homeopathy

Despite predictions that homeopathy was doomed, it continued to spread in the 1840s as orthodox practitioners like Hooker became increasingly hostile and defensive. Homeopaths also went on the offensive, claiming their system had a firmer grounding in scientific experimentation than orthodoxy, while criticizing the regular profession for an influx of inferior physicians. The regular profession was in turmoil, and homeopaths more than any other group advertised its shortcomings. The dramatic growth of proprietary medical schools compromised educational standards, faculty disputes ran rampant, doctors were unable to agree on methods of diagnosis and treatment, and citizens were outraged at the attempts of some physicians to regulate medical fees and eliminate competition. Acknowledging these problems, regular doctors sought to regain lost prestige by forming a national professional organization to improve medical education. Physicians saw the improvement of educational standards as an opportunity to promote citizen confidence in orthodoxy, ensure the elimination of inferior physicians and quacks, and inhibit defections to homeopathy.

At the first meeting of the fledgling American Medical Association (AMA) in 1846, no one mentioned homeopathy or other medical sects. The top priority was the improvement of standards and requirements for the medical degree. The following year, however, the formulation of a code of ethics explicitly asserted that no homeopath could consult with an orthodox physician, even if the patient requested such a meeting. The so-called consultation clause was sometimes carried out to the point of absurdity. It prevented the regular physician from coming to the aid of a patient whose doctor was a homeopath, regardless of how desperate the situation was—this despite the fact that by the early 1850s, the majority of the homeopaths were themselves graduates of orthodox medical schools. Nonetheless, by 1855 the member societies of the AMA had adopted the code of ethics, and the conflict between homeopathy and orthodoxy was officially sanctioned. Intended to separate quackery from orthodoxy, while publicly condemning sectarian practitioners, the code and the growth of the AMA did not bring the end of homeopathy. Enforcement of the code did, however, help to polarize the medical profession for the remainder of the century.

The first major battle between homeopathy and orthodoxy took place in the late 1850s, over the control of wards in newly constructed municipal hospitals. As major cities like Chicago, New York, and Boston made a commitment to provide medical care for the urban masses, homeopathic physicians applied for equal access. While homeopaths campaigned for hospital jobs, orthodox practitioners from 1850 to 1880 nearly unanimously refused to serve alongside homeopaths. With a stranglehold on medical boards, the orthodox community was even able to exclude homeopaths from military service during the Civil War, despite the fact that doctors were almost always in short supply.

Accommodation and a New Code of Ethics

During the 1860s and 1870s, regular practitioners gradually abandoned the harsh treatment of the age of heroic medicine, and the orthodox and sectarian found common cause to settle some of their disputes. Milder medication replaced heroic remedies, and more physicians relied upon the body's natural healing powers. At the same time, many who considered themselves homeopaths increasingly deviated from the tenets of Hahnemannian medicine, and the homeopathic profession began to fragment. While high-dilution advocates adhered carefully to Hahnemann's doctrines, other more eclectic homeopaths accepted orthodox remedies or dispensed homeopathic drugs in large doses. Some homeopathic graduates of orthodox medical schools experienced the benefits of

allopathic treatments and were attracted to an increasingly scientific medicine. The public and sectarians alike responded enthusiastically to exciting advances in surgery, preventative medicine, and pharmacology. Many homeopaths began to blend their teachings with the new orthodoxy, partly in response to patient requests and partly in hopes of achieving greater professional respect.

By the 1880s, the majority of homeopaths were in favor of dispensing both traditional homeopathic treatments and orthodox remedies. The growth of specialization increased the need for interdependence in the profession across sectarian and orthodox lines. Orthodox specialists relied on referrals from homeopaths, just as sectarian general practitioners relied on orthodox hospital administrators for access to facilities. A renewed licensing movement concurrently promoted collaboration between regular physicians and homeopaths to win laws that would protect all of them from competition with poorly trained practitioners, coming primarily from proprietary schools serving as diploma mills.

In an effort to strengthen and unify the profession, discussions of a revised code of ethics officially began at the annual meeting of the Medical Society of the State of New York in 1881. By early 1882, a committee had crafted a new code that abandoned the consultation clause and placed the health of the patient above professional restrictions. Defenders of the new code, usually younger physicians, claimed that the old code was an infringement on the rights of citizens to freely meet with their physician of choice. They argued that since homeopathy had been legalized in every state, it should receive professional recognition.

Despite support for the new code in newspapers and leading magazines, twelve of the fourteen state medical associations that met prior to the 1882 AMA convention passed resolutions condemning their colleagues. At the AMA meeting in Cleveland the following year, every delegate was asked to sign a pledge of allegiance to the old code of ethics. By 1885, the new code became a national issue that threatened to destroy the Ninth International Medical Congress to be held in Washington, D.C. When the AMA decided that only those physicians who accepted the old code of ethics could serve on any committee of the International Congress, prominent new code supporters like Henry Bowditch, who had served as president of the AMA in 1877, were summarily excluded. The new code controversy threatened to destroy what defenders of the old code cherished most—professional respect, integrity, and brotherhood.

While the consultation clause issue divided the orthodox profession into liberal and conservative wings, the homeopathic response was also mixed. Editorials in homeopathic publications warned that the acceptance of orthodox practitioners would threaten the individuality and therapeutic advantages of homeopathy. In 1885, the American Institute of Homeopathy suggested there was reason to be afraid. The AMA's attempts to establish licensing boards, which were dominated by orthodox practitioners, threatened to place the fate of homeopathy in the hands of the enemy.

A resolution to the protracted battle over consultation came at the 1903 AMA meeting in New Orleans. The old code of ethics was replaced with a document that opened up membership to any legally registered and reputable physician who was not supporting an exclusive medical system. This did not explicitly forbid homeopaths from joining the AMA, but it did suggest that they must not practice homeopathy exclusively. The document noted that it was inconsistent with scientific principles for physicians to designate their practice as exclusive or sectarian. The new code, however, avoided any reference to the type of medicine doctors actually practiced, allowing homeopaths to win a share of the scientific and professional benefits of the AMA.

Accommodation by the AMA came at the height of homeopathy's rise. In the two decades following the Civil War, homeopathy had gained the support of local boards of health, the government's medical corps, and the general public. When the regular profession denounced homeopaths, they thrived. By 1900 there were twenty-two homeopathic medical schools, more than 100 homeopathic hospitals, and more than 1,000 homeopathic pharmacies. Advocates of homeopathy included some of the most prominent and respected members of American society, such as William James, Nathaniel Hawthorne, Daniel Webster, William Seward, Harriet Beecher Stowe, Louisa May Alcott, and John D. Rockefeller. At the turn of the century, homeopathic physicians were generally supported in the press; they were famous for their success at treating various infectious epidemic diseases throughout the nineteenth century and prolific in scholarship with more than twenty-nine different homeopathic journals.

Ironically, the more homeopaths gained access to the privileges of the regular profession, the more their numbers declined. By 1910, there were only twelve

homeopathic medical schools left, and by 1923 only two remained. Internally, homeopathy suffered from doctrinal disputes and a softening view of orthodox medicine. While earlier advocates of homeopathy could point to a dramatic therapeutic difference with regular practitioners, the alternative to homeopathic practice was no longer so dreadful. Even regular physicians were now using large amounts of homeopathic medicines themselves. Meanwhile, as the orthodox community used scientific knowledge to distinguish between competent practitioner and quack, homeopathic colleges that decided to offer more education in the medical sciences to compete with orthodox schools often compromised training in homeopathic therapies. As a result, graduates from these colleges were less able to practice homeopathy and often prescribed medicines according to the disease categories of orthodoxy. Eventually, many homeopaths gave up homeopathic practice, while homeopathic patients sought other types of care.

Homeopathy was further weakened by socioeconomic factors. First, more money was to be made in specialization than in either homeopathic or orthodox general practice. Specialization was rarely an option for the homeopath because it was incompatible with the spirit of homeopathic doctrine. Second, homeopathy was ill equipped to match the combined resources of the AMA and the rapidly expanding drug industry. By 1910, the AMA had made a deal with patent-drug manufacturers that supplied a constant flow of money in the form of advertising revenue for medical journals. As these same medical journals became mouthpieces for pharmaceutical companies, homeopathy suffered the consequences of bad press. Ultimately, homeopaths found it difficult to compete with the quick fix provided by the proliferation of patent medicines and the acceptance of new drugs into the cabinets of orthodox physicians.

The Flexner Report and Reform of Medical Education

At the turn of the century, a reorganized and strengthened AMA returned to the problem that had originally motivated its formation by making the reform of medical education its top priority. The AMA had two longstanding goals that had not been met effectively since its formation fifty years earlier. First, the AMA hoped to renew licensing laws in order to combat the problem of competition in the medical marketplace. Second, in response to the glut of poorly trained physicians graduating from proprietary schools, members of the AMA wanted to improve their social, economic, and professional status as a group. In 1904, the AMA established the Council on Medical Education to evaluate the quality of instruction in the nation's 161 medical schools. The initial report, issued in 1907, declared that only 82 schools provided acceptable instruction, while 47 were listed as doubtful and 32 unsatisfactory. Homeopathic schools were largely condemned for their inability to meet requirements of adequate instruction in physics, chemistry, and biology. The first chairman of the council predicted that homeopathy would soon die out for lack of students, once the results were made public.

The report of the council presented one major problem for the AMA. Its own professional ethics code frowned on physicians attacking each other in public. Not only would publication of the council's report create ill will, but it would also be a technical violation of its own code. A new report from the independent and unbiased Carnegie Foundation for the Advancement of Teaching would be necessary to provide the objectivity of a disinterested body. This report could then be published as part of a broader effort to shape public opinion in support of the AMA's objectives.

In 1910, the Carnegie Foundation commissioned Abraham Flexner to conduct an evaluation of sectarian and regular medical schools. The result was his report, "Medical Education in the United States and Canada," colloquially referred to as the Flexner Report on Medical Education. The Flexner Report rated schools according to the same standards. Flexner measured schools by the quality of their laboratories, size of their teaching hospitals, level of endowments, entrance qualifications, and amount of original research produced. Almost all of the homeopathic institutions failed to satisfactorily meet one of these criteria. Flexner criticized homeopathic schools for their failure to undertake progressive scientific work, a lack of resources, and their preference for employing professors who were also in clinical practice. While he was willing to credit homeopathy with playing an important part in discrediting the excesses of orthodox therapies, he argued that the orthodox schools were already doing the work of homeopathy far more effectively. Furthermore, Flexner insisted that adherence to Hahnemannian dogma by homeopaths was incompatible with science. Homeopathy was judged an unfit system for training physicians in scientific medicine.

Although Flexner was equally critical of many regular schools, the Flexner Report was clearly more

damaging to homeopathic schools as a whole. He denounced almost all of the existing schools for poor standards and made no allowance for their survival in his plans for reconstructing medical education. Flexner helped seal the fate of many homeopathic schools that were already struggling to meet the financial burdens of operating in a competitive marketplace. Licensing boards and potential students alike subsequently scorned schools with poor ratings.

The impact of the Flexner Report was heightened by internal problems within homeopathy. The report heightened the debate between the pure Hahnemannians committed to the doctrine of infinitesimals and the revisionists who were unwilling or unable to adhere to Hahnemann's rigid formula for therapeutics. Following the publication of the Flexner Report, some homeopaths maintained that homeopathic schools were closing because they did not teach pure homeopathy but instead devoted too much time to medical science. Other purists maintained that the new standards set by Flexner were too high and would require too much money to revamp existing programs.

The Flexner Report created a standard that favored orthodox medical education in an era characterized by a dramatic increase in philanthropic support for schools. In 1920, for example, the struggling Hahnemann Medical College of Philadelphia was unable to obtain funds from the General Education Board of the Rockefeller Foundation, despite the fact that John D. Rockefeller himself continued to consult a homeopath for his personal medical care. The General Education Board appropriated nearly $15 million for medical education by 1920, and by 1929 the total had climbed to $78 million. However, homeopathy colleges were not the recipients of these awards.

Decline of Homeopathy

The 1920s and 1930s brought a reinvigorated attack on all forms of unorthodox medicine. Orthodox practitioners abandoned any reference to their practice as "regular," and those outside the bounds of orthodoxy were no longer designated as "sects" but rather as "cults." The long-time editor of the *Journal of the American Medical Association*, Morris Fishbein, disseminated this representation of unorthodox medicine as cultlike most enthusiastically. In 1925, Fishbein published *The Medical Follies*, a best-selling book attacking the "healing cults." Although Fishbein acknowledged that homeopathy had encouraged positive reforms in orthodox practice, he concluded that it had ultimately died from internal inconsistencies.

In 1935, the AMA Council on Education outlawed the inclusion of unorthodox systems on the list of approved medical colleges and hospitals. This action eliminated the possibility of homeopathic schools benefiting from the extensive philanthropic support of regular medicine. By this time, the doctrinal split in homeopathy caused sufficient organizational and political weakness to preclude a significant response. In the decades to follow, homeopaths still made efforts to convince the AMA to recognize homeopathy as a specialty in internal medicine, but to no avail. By 1950, all the homeopathic colleges in the United States were either closed or no longer teaching homeopathy exclusively.

Homeopathy encountered a series of forces, peculiar to the American medical scene, that remained insurmountable. Practitioners were weakened from the attack on marginal schools instituted by the Flexner Report, unable to compete with the concentration of resources in fewer institutions, and burdened by a unified condemnation from the AMA and pharmaceutical industry. All the while, the orthodox community never provided scientific evidence that homeopathy failed to generate positive therapeutic results. Meanwhile, in Europe homeopathy maintained a large share of patients and in some countries expanded its base of patients and practitioners.

In the United States, however, homeopathy was on the brink of extinction by the 1960s. Most of its practitioners were over sixty years old. Few physicians were converted to homeopathy partly because it required a high level of therapeutic knowledge and expertise for practice, while demanding greater time and energy from the physician. Some predicted that homeopathy would not survive the twentieth century. With fewer than 200 practicing homeopaths, prospects remained grim.

Unexpected Revival

In the face of internal and external pressures, homeopathy did not die out. In the 1970s, there were only 50 to 100 physicians who specialized in homeopathy, and yet by the mid-1980s approximately 1,000 homeopaths had established practices. Capitalizing on the resurgence of alternative medicine in the 1970s, homeopaths reasserted their position, in opposition to a medical profession increasingly criticized for invasive therapies and limited success in combating major diseases. In the 1990s, studies in major medical journals revealed that patients used alternative medical

systems like homeopathy because they found these healthcare alternatives to be more congruent with their own values, beliefs, and philosophical orientations toward health and life. Some see the resurgence of alternative forms of medical care as a testimony to the increased public dissatisfaction with modern medicine and its delivery system. Others suggest that the public evaluation of scientific medicine must be separated from evaluation of physicians.

In addition to the resurgence of homeopathic physicians, since the 1970s dozens of new homeopathic medical schools have been established, sales of homeopathic medicine have increased 2000 percent, and for the first time, some orthodox medical journals have conducted successful clinical trials validating the efficacy of homeopathy. Although homeopathic practitioners continued to be marginalized by the orthodox community, a strong push toward a complementary approach to therapy by organizations like the AMA suggests that homeopathy will continue to thrive in the decades to come.

American Intentional Communities

Intentional communities—communities devoted with intent, resolve, and commitment to a collective objective—have been a part of the American cultural scene since the early days of European settlement. Some had very idealistic aims and were also called utopian communities. The first British settlers at Jamestown, Virginia, adopted a communal form of organization for a time, as the Pilgrims did later at Plymouth, Massachusetts. Thousands upon thousands of experiments in community have dotted our history ever since.

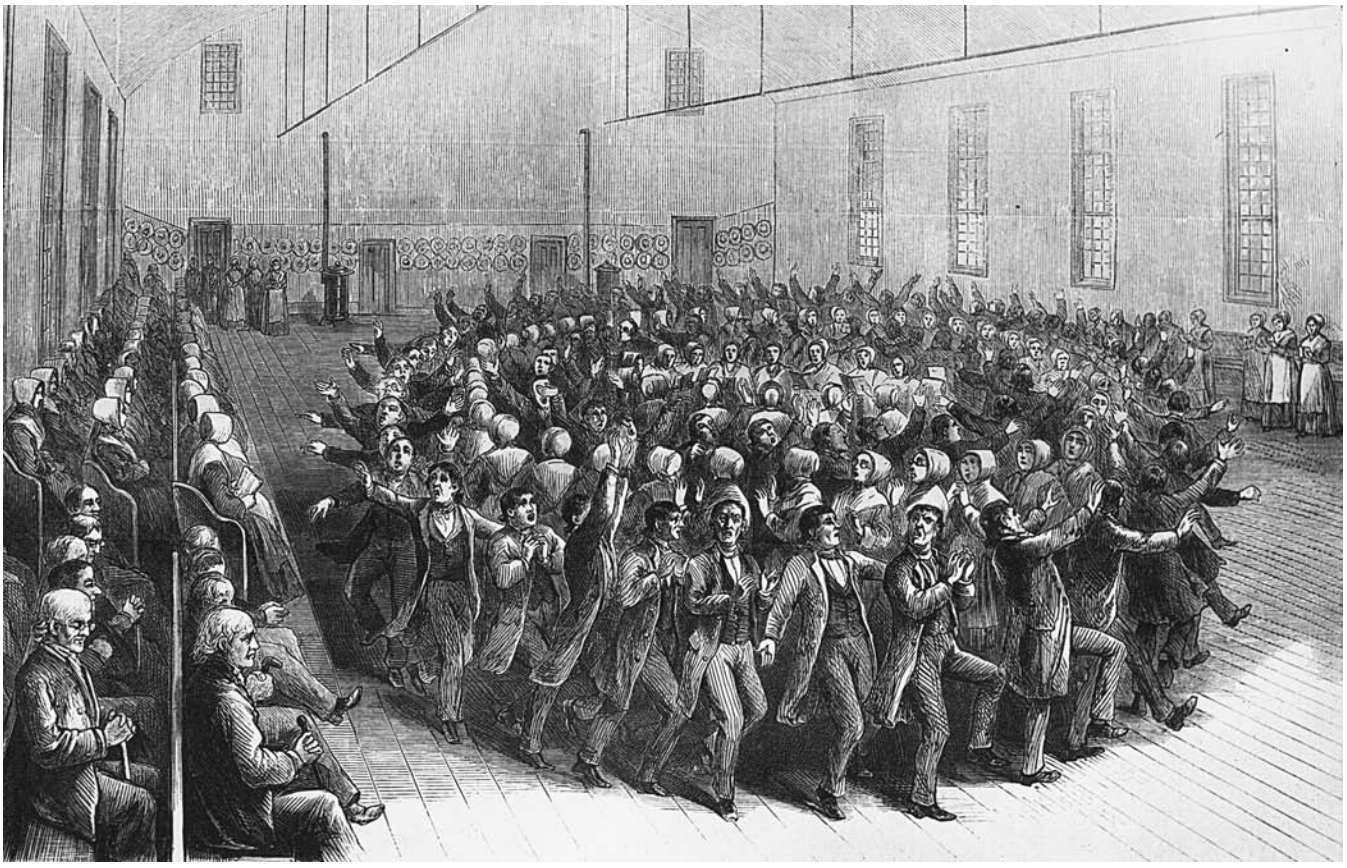
What is generally regarded as the first true intentional community in America—the first settlement organized from the beginning on explicitly communitarian principles—was Swanendael, or Plockhoy's Commonwealth. In the late 1650s, Peter Cornelius Plockhoy, a Dutch Mennonite, began to publish tracts that envisioned a community in which all residents would be equal, all work would be agreeable, and all points of view would be welcome. In 1663, Plockhoy and a band of some forty followers, with financial backing from the city of Amsterdam, set sail for America and in due course settled near what is now Lewes, Delaware. The fate of the colony is unknown because the Netherlands and Britain soon went to war, and a British detachment razed the colony a year after its founding.

Two other important communes followed Plockhoy's in the seventeenth century: the Labadist Community at Bohemia Manor, Maryland, and one popularly known as the Woman in the Wilderness in what is now Philadelphia. Both survived longer and had more impact on later communities than Plockhoy's did. Both (but especially the Woman in the Wilderness) influenced Johann Conrad Beissel, who in 1732 founded the earliest intentional community of which any built remnant remains, the Ephrata Community, or Cloister, in Lancaster County, Pennsylvania. Celibate renunciates, both men and women, lived lives of austere devotion and hard work, denying themselves worldly pleasures in their spiritual quest, producing marvelous works of choral music, beautifully illuminated manuscripts, and extensive works of prose and poetry published by their own press. Ephrata was not only one of the earliest American communal societies, but also among the longest-lived; it endured communally until 1814, and a few members remained on the premises until the 1890s.

The Shakers

While Ephrata was at its peak, the first members of what was probably the most famous American communal movement of all began their work. The first Shakers (more formally, members of the United Society of Believers in Christ's Second Appearing) arrived from England in 1774 and soon took up the common life near present-day Albany, New York. Their visionary founder, Ann Lee, proclaimed a message of repentance of sin and the abandonment of worldly attachments. Very early, apparently, the movement demanded celibacy of all of its resident members. Although Lee died in 1784, able leaders arose to organize the Shakers into their characteristic village colonies. Eventually, Lee came to be regarded as Christ in the Second Coming (the "Second Appearing" of the group's formal name).

The Shakers grew for several decades, eventually numbering several thousand members in around twenty communal villages, the larger of which had several hundred members each. Following Ann Lee's dictum, they put their "hands to work and hearts to God" and produced some of America's most admired craftworks, including elegantly simple furniture and the exquisite villages themselves, several of which survive as museums. The Shakers did not consider the production of beautiful artifacts, however, to be their chief goal. Instead they, like other monastics, were simply leading dedicated and highly ordered lives in



Shakers dance at a meeting in 1873. The Shakers—so named because they practiced shaking, shouting, dancing, and whirling during their religious services—derived from the radical English sect, the Quakers, and set up communal societies in New England, New York, Kentucky, Ohio, and Indiana. Shakers believe in celibacy, equality, and simplicity, and although their numbers have dwindled, they remain active today. *(Brown Brothers)*

the service of God. The enforcement of celibacy meant that men and women were strictly separated, and a hallmark of Shaker architecture became its system of double doors and stairways—one for each sex. In their early years, the Shakers were well known for their vigorous worship practices, which involved "laboring," or group dancing, which could continue for hours. They also wrote thousands of spiritual songs, including the widely familiar "Simple Gifts."

Despite their disciplined lives set apart from the "world," as the general society was called, Shakers were not antimodern. On matters of gender and racial equity they were more than a century ahead of their time, accepting African-American members on an equal basis with all others and affirming the full equality of men and women. Gender equality was reflected in the Shakers' governance of each village with a ministry team of two brothers and two sisters, and a similar four-member ministry group over the whole movement. The Shakers were also inventive folk, credited with such creations as the circular saw, the clothespin, and the flat broom. They embraced technology readily, driving cars and trucks, for example, when they became available. Today's Shakers use computers.

The latter half of the nineteenth century was marked by a decline in the number of members, a trend that accelerated during the twentieth century. By mid-century, the end of Shakerdom seemed inevitable, as village after village closed. In 1947, the headquarters village at Mount Lebanon, New York, was shuttered. For several years two villages—Canterbury, New Hampshire, and Sabbathday Lake, Maine—continued to operate with only a few members each. In 1965, the leaders at Canterbury closed the society to new members; Sabbathday Lake continued to welcome newcomers. Sabbathday remains the only surviving Shaker location, with fewer than ten members, although inquirers do visit and occasionally a new

The Rappite House in New Harmony, Indiana. George Rapp, a German linen weaver, established the utopian community of Harmony (also spelled "Harmonie"), first in Pennsylvania and then in southern Indiana in the early 1800s. Rappites renounced marriage and lived in celibacy. In 1825, Rapp sold the entire village to Robert Owen, who used the land, houses, and work buildings to launch his own utopian society. *(Library of Congress)*

member does join. At present the Shaker existence is tenuous.

Harmonists and Rappites

Not too many years after the arrival of the first American Shakers came several groups of German immigrants who sought the freedom to live communally and practice their faith in America. One of the earliest and largest groups was the Harmony Society, which arose in the German province of Wuerttemberg in the late eighteenth century. The Harmonists constituted a particularly radical wing of the Pietist movement, which had recently arisen to challenge the formality and cold intellectualism of the established Lutheran church. The Pietists sought a heartfelt religious experience that included personal conversion and a striving for Christian perfection; some wanted to reform Lutheranism, but others sought to sever their ties with an institution they considered incapable of real transformation. Several separate groups ended up leaving Germany in their religious quest.

Into this environment came George Rapp (1757–1847), whose powerful Pietist convictions and leadership prowess won him some thousands of followers by about 1790. For several years tension between the civil authorities and the Rappites was intense, and eventually they decided to emigrate. In 1804, George Rapp and his associates purchased a tract of land

north of Pittsburgh, Pennsylvania, on which they founded the communal village of Harmony. For a decade they built up their isolated village, but in 1814 Rapp decided that the group should move west. They purchased a large tract on the Wabash River, just upstream from the Ohio, in southern Indiana, which today remains one of America's most pristine museum villages. They achieved great prosperity in their new home, with extensive farms and industries, and soon they seemed permanently settled there. But in 1824 George Rapp decreed yet another exodus, this time to a place called Economy just a few miles from the original Harmony in Pennsylvania. In that last location the Harmonists achieved even greater prosperity and built the most extensive settlement yet. Eventually, however, the society began to fray. Celibacy, which had been introduced at the original Harmony, meant that the movement quit producing potential new members from within. A charismatic visitor who called himself the Count de Leon led a large group of disgruntled members out of the community in 1832. Rapp's death in 1847 led to notable organizational changes. Community life continued for several decades, but after the deaths of the old-line Rappites one John Duss seized control of the organization in the 1890s and squandered what was by then its vast wealth. In 1905, just a century after its arrival in America, the Harmony Society was dissolved.

Inspirationists and Amana

Another notable group of communal Pietist immigrants whose story to a degree paralleled that of the Harmonists was the Community of True Inspiration, also a product of the German Pietist unrest of the eighteenth century. Its distinctive contribution to communal Pietism was its embrace of the precept that a few persons, in the pattern of the biblical prophets, could speak with divine inspiration. Several of these inspired "instruments" helped shape the society's history—and none more so than Christian Metz, who, in 1843 and 1844, oversaw a migration from Germany to New York State, where the group founded a community called Ebenezer. As had been the case with the Harmonists, the Inspirationists, soon numbering more than 1,000, came to feel a need to move west, and in 1855 they began to resettle on a large tract of land in eastern Iowa. Calling the new location Amana, they built up seven villages under Metz's able direction. Eventually, however, spiritual restlessness among some members and economic problems exacerbated by the Depression forced an abandonment of the fully communal way of life at Amana. In 1932, the society decommunalized its economy. Its surviving industries, including the flagship appliance-manufacturing company, became private enterprises. Nevertheless, many Amanans stayed on. The Inspirationist church continues to operate (albeit without an inspired leader for more than a century), the factory turns out refrigerators and microwave ovens, and the Amana Society still has extensive land and business holdings. The colonies, now accessible by interstate highway, have become the leading tourist attraction in Iowa, marketing their own past to millions of visitors.

Noyes and the Oneidans

Many other immigrant colonies, albeit smaller than those of the Harmonists and Amanans, also flourished in the nineteenth century—the Zoar Society in Ohio (another product of German Pietism), Bishop Hill in Illinois (founded by dissenting Swedish Lutherans), and many more, all with fascinating stories. At the same time, home-grown prophets proved as capable as any of the immigrant leaders of bringing believers into the common life. Among them none was more successful, flamboyant, and famous (notorious, his detractors would say) than John Humphrey Noyes, the founder of the Oneida Community. Noyes was converted in a revival in 1831and began to study for the ministry. In 1834, he concluded that he was freed from sinfulness and was morally "perfect"; his community eventually developed as a place in which he and others who had transcended the human propensity to sin could build what was actually regarded as the beginning of the Kingdom of God on earth. No part of Noyes's unorthodox theology was more controversial than "complex marriage," in which the community of the saved became a family, with all men married to all women, with all of the sexual privileges that relationship implies.

Community life began in the mid-1840s in Putney, Vermont, but complex marriage scandalized that small town and Noyes was soon indicted for adultery. Later, in 1847, Noyes and his closest disciples then headed for upstate New York, where they settled outside the town of Oneida. Although their situation was financially precarious at first, eventually they built up solid industries; animal traps were a major success, followed by the silverware that has made "Oneida" a household word. Through their publications, they were a beacon among the intentional communities and social reformers of the day. Eventually, however, pressures—especially the inevitable external attacks against a community founded on such radical principles—took their toll on the community. In 1879, the

community abandoned complex marriage, and in 1881 its successful industry was transformed into a joint-stock corporation. The Mansion House—where hundreds of members lived under one roof—survives and continues to be inhabited in part by descendants of the original Oneidans.

Secular Intentional Communities

Religion was not the only basis for organizing intentional communities in the nineteenth century. The first of several secular movements to receive wide notice was the New Harmony of Robert Owen. Owen made a fortune as a mill-owner in Scotland and became renowned as a social theorist and reformer, one who held that workers, having created wealth, had a right to a share of their productivity. New Lanark, his company town, was publicized as a workers' paradise. In his prolific writings, he envisioned cooperative villages in which all would share in production and in the fruits of the community's enterprises under conditions of universal social equality.

Owen had hoped to inaugurate some grand communitarian experiments in Scotland, but land there was prohibitively expensive. When word reached him that George Rapp's Harmony Society was selling its entire town of New Harmony and its 20,000 acres, he seized the opportunity and purchased the property early in 1825. But as a community the experiment was short-lived. Owen flung the doors of his community open to all, attracting deadbeats as well as industrious idealists. It turned out that a diverse lot of people did not necessarily work harmoniously together. By 1827, the communal phase of New Harmony was over. The influence of the experiment, however, was enormous. New Harmony attracted a large contingent of intellectuals and became an important center of scholarship, particularly in geology and natural science. Its progressive schools became models for educational reformers. It was the home of the first American trade school. Its library for workers inspired some 160 other such institutions. Over a dozen other communal experiments based on Owen's ideas were started around the country. Owen himself remains a major figure in the history of socialism and social reform. In short, the influence of Owenite New Harmony extended far beyond its short communal lifespan.

One of the best-known American communities of all was Brook Farm, which was founded by George Ripley and others at West Roxbury, Massachusetts (now a part of the city of Boston), in 1841, as a direct outgrowth of the Transcendentalist ferment then at its peak. The New England Transcendentalists, of whom the leading light was Ralph Waldo Emerson, sought both free mental exploration and direct experience of the material world, and Ripley proposed to bring the diverse values of the movement together in a rural social experiment. Although many of the Transcendentalists declined to join the project, a goodly contingent of free-spirited and intelligent young adults jumped in and created what by all accounts was a fulfilling round of manual labor, intelligent conversation, and lively socializing. Especially prized was the community's school, which attracted students from far and wide.

In 1844, Brook Farm announced its reorganization as the Brook Farm Phalanx. By that time, the social ideas of the Frenchman Charles Fourier had developed an American following, and for a time Brook Farm became the intellectual center of Fourierism, which proposed to organize society in a manner that would be tightly prescribed but wonderfully fulfilling to its members. Under Fourier's system, exactly 1,620 persons would constitute a "phalanx," or community, and live and work in a "phalanstery," a huge structure surrounded by a large tract of open land. Brook Farm had a short-lived career as a phalanx because its grand phalanstery burned to the ground just as it was being completed in 1846, and the community could not survive that crushing blow. However, dozens of other phalanxes were founded from Massachusetts to Texas before the movement ran its course toward the end of the century. Most were short-lived, with only a handful lasting more than three years. Fourier's sweeping ideas, however, have influenced later communitarians and cooperators, especially those who founded cooperative stores and workshops throughout the country.

Another French-inspired secular communitarian movement shared the heyday of Fourierism. In 1839, Etienne Cabet published the utopian novel *Voyage en Icarie* (Journey in Icaria), a massive work along the lines of Thomas More's *Utopia*. Hundreds of readers of the work found it so inspiring that they determined to make it a built reality. Taking personal leadership of the movement he inspired, Cabet, like so many other European utopians, concluded that America was the best site for his project. In 1848, the first Icarians headed for Texas, where Cabet had purchased a million acres in the Red River Valley. For a variety of reasons the site was utterly unworkable, and when Cabet himself arrived in 1849, he and those willing to try again found a more congenial location—Nauvoo, Illinois, the home of the Latter-day Saints who had lately left for Utah. They bought much of the town

Founded by Transcendentalists in West Roxbury, Massachusetts, in 1841, the Brook Farm Institute of Agriculture and Education, as it was formally known, combined manual labor with progressive educational techniques, such as nonpunitive discipline, intellectual discourse, and open-ended study hours. Among Brook Farm's many literary residents was Nathaniel Hawthorne, who immortalized the community in his 1852 novel, *The Blithedale Romance*. *(Brown Brothers)*

from the Mormons and moved in. The lives of the Icarians were strictly regulated, but they developed a society that valued education, cultural pursuits, and gender equality. However, divisions soon erupted, not least because Cabet's authoritarian ways alienated a majority of his followers. In 1856, the anti-Cabet majority evicted the founder and his loyalists. Cabet then founded a new Icaria just outside St. Louis. A financial crisis at Nauvoo forced the remaining communitarians to move to Iowa, where cheap government land was available. In 1881, some members of New Icaria moved to California and founded the last colony, Icaria Speranza, north of Santa Rosa. It was dissolved in 1886, and in 1898 the last Iowa Icarians dissolved their community as well.

Secular communities would continue to be founded ever afterward. In 1885 a group of San Francisco Socialists moved to the Sierra Nevada and, with devoted physical labor, built the Kaweah Cooperative Commonwealth, a dynamic little utopia whose life was cut short when the federal government preempted the colony's land, without payment, to create Sequoia National Park. A notable cluster of Socialist and Anarchist communities grew up in Washington State; among them were the Puget Sound Cooperative Colony, located at Port Angeles, founded in 1887; Equality, near Bellingham, 1897; Burley, on Puget Sound, 1898; Freeland, on Whidbey Island, 1899; and the most notable of them all, the Home colony, which for more than twenty years after its founding in 1896 was a bastion of American Anarchism. Ruskin Colony, in Tennessee, published the *Coming Nation*, the nation's leading Socialist newspaper, in the 1890s, and the Llano Colony, first near Los Angeles and later in Louisiana, was a key center of American socialism in the 1910s through 1930s. Economic reformers also founded a number of cooperative settlements, including ten or so devoted to embodying the single-tax principles of Henry George. (Fairhope, Alabama, and Arden, Delaware, were prominent examples.)

Late-Nineteenth-Century Religious Communities

The latter part of the nineteenth century was rife with all kinds of religious communities. One of the most extensive networks of communities in American history was (and is) that of the various groups of Latter-day Saints (LDS). The Mormons had experimented with communal forms as early as the 1830s, but under Brigham Young in Utah in the 1870s, the United Order of Enoch, as it was known, was launched in earnest. Well over 100 United Order organizations were formed, some of them thoroughly communal in structure and others only loosely cooperative. Although the main Mormon church eventually gave up on communal living as an ideal, the legacy of the United Order lives on in the church welfare system, cooperative stores, and close-knit relations among believers. Moreover, dozens of Mormon splinter groups, many of them retaining the practice of polygamy that the main church abandoned early in the twentieth century, continue the communal tradition today. The polygamy-practicing splinter LDS settlement at Colorado City, Arizona, is the largest intentional community in the United States today, with over 5,000 resident members.

Hutterites

In 1874, just as the United Order was being launched in Utah, what would become the largest communal movement in North American history took root on the American plains. Founded in 1528 as a radical Anabaptist movement, the Hutterites had, after many migrations, settled in the Ukraine in 1770 with the understanding that they could live in their own communities and not be drafted into military service. When the special privileges were lifted in 1871, however, the Hutterites moved yet again. They arrived in South Dakota in 1874, organizing themselves into three separate subgroups (Schmiedeleut, Dariusleut, and Lehrerleut) and living in colonies of around 100 members each.

World War I was a difficult time for these German-speaking pacifists, and amid severe persecution most of them left the United States for the western provinces of Canada. In the 1930s, they began to return to the United States, and today they operate freely in both countries. With a high birth rate and strong retention of their young people, the Hutterites have seen explosive growth, today numbering over 40,000 in over 400 colonies. They embrace modern, large-scale agricultural technology but culturally remain largely isolated from the outside world. Their communitarianism is thorough; private property is limited to a few intimate personal items. By any standard (size, longevity, prosperity), the Hutterites are the leading American communal success story, exceeded in scope only by traditional religious communities of monks and nuns. Another similar movement, the Bruderhof, was founded in Germany in 1920 in explicit imitation of the Hutterites. It came to the United States in 1954 and now has over 2,000 members in several colonies in the United States and abroad.

The Hutterites were not the only refugees from eastern Europe who settled in intentional communities in the United States in their era. Shortly after their arrival came a large wave of Jewish community-building, fueled by the influx after 1880 of large numbers of refugee Jews fleeing persecution. Although most of the colonies, based on agriculture and light industry, were soon dissolved, traces remain, especially in southern New Jersey, where several former colonies (Woodbine, Brotmanville, Norma) continue their existence as small towns.

The turn of the twentieth century saw the rise of a number of communities led by independent religious visionaries. In the 1890s, Cyrus Teed, known as "Koresh," established his Koreshan Unity community at Estero, Florida, which lasted several decades and whose buildings have been preserved as a state park; the movement was best known for Teed's teaching that the earth is hollow and we live on the inside of it. Zion City, founded north of Chicago by the faith-healing evangelist John Alexander Dowie in 1901, may have had more than 5,000 resident members at its peak. The House of David was founded in 1903 at Benton Harbor, Michigan, by Benjamin and Mary Purnell, as one of many groups descended from the work of the English mystic Joanna Southcott. It was best known to the general public for its barnstorming baseball teams whose players never cut their hair or beards. Zion City continues as a noncommunal town, its independent Dowieite church still strong, while the House of David, now divided into two factions, continues to lead a tenuous existence in Benton Harbor.

New Age Religions

The turn-of-the-century era also saw the beginnings of religious communalism grounded in Asian, esoteric, and New Age religions. Theosophy, a blending of Asian and Western mystical religious traditions, established several communal centers, the largest and best-known of them at Point Loma, California (today part of San Diego), where several impressively exotic

buildings were erected and a wide variety of educational and cultural activities were pursued for several decades after 1897 under the leadership of Katherine Tingley. Theosophy also gave rise, indirectly, to the Camphill movement, which later in the twentieth century created a network of communities dedicated to caring for handicapped and retarded persons.

A later manifestation of the spiritual quest, the loosely defined New Age movement also gave rise to several communal centers, such as the far-flung Emissary communities, whose headquarters, Sunrise Ranch in Colorado, has been operating since 1945. The Vedanta Society, one of the early Hindu movements to establish an American foothold, had communal ashrams (Hindu religious retreats) operating in the first decade of the new century, and Buddhist monastic communalism began in the 1930s with the work of Dwight Goddard, a Baptist missionary to China who converted to Zen Buddhism and promoted his new religion upon his return to the United States. After changes in American immigration laws in 1965, many Asian teachers arrived on American shores, and Asian-based religious communities mushroomed. Hundreds of communal centers representing most major branches of Hinduism and Buddhism operate today.

Working artists have long congregated in various attractive locales, and for a few decades at the beginning of the twentieth century some of them went a step further and formed intentional communities. The Roycrofters, under the commercially savvy leadership of Elbert Hubbard, turned out a commercially successful line of books and furniture from their colony at East Aurora, New York. In 1902, Byrdcliffe was founded and funded by a patron, Ralph Radcliffe Whitehead; it made Woodstock, New York, the center of the arts, which it has been ever since. Rose Valley, near Philadelphia, had as many as sixty residents during its brief communal life from 1903 to 1908. Some communal colonies of the arts continue to operate quietly today.

A surge of commune-founding followed the onset of the Depression after 1929. The federal government, as a part of its general poverty-fighting program, sponsored around 100 collective settlements under the Division of Subsistence Homesteads and later the Resettlement Administration. At the same time, independent activists promoted self-sufficient living in small communities. Ralph Borsodi, a zealous advocate of self-sufficiency, formed what he called the School of Living. Arthur Morgan similarly promoted all kinds of small communities as an antidote to the ills of the day; the intentional communities of mid-century owe much to his leadership. As always, independent visionaries appeared with their own communal solutions to the ills of the day. The most prominent of them in the 1930s was Father Divine, whose followers considered him God in the flesh and who lived by the thousands in Divine's "heavens," as the communities were called.

The 1960s and 1970s

The era from the early 1960s through the mid-1970s saw the greatest outpouring of communal living that the country has ever seen. Mostly young persons affected by the cultural and political upheavals of the day banded together in huge numbers and formed thousands of urban and rural communes. Such early examples as Tolstoy Farm, an anarchist enclave in eastern Washington State (founded 1963), and Drop City, an art colony outside Trinidad, Colorado (founded 1965), offered exciting new lifestyle visions and opened their doors to all who would come. In 1966, Lou Gottlieb, a member of the Limeliters folk-music group, opened his 31-acre Morning Star Ranch north of San Francisco to one and all, and there soon ensued a veritable flood of communes on the West Coast. By about 1967, communes were turning up everywhere. They came in many styles and lived by many philosophies. The largest of them all, the Farm, founded in 1971 near Summertown, Tennessee, embodied the spirit of the day in classic form. Led by Stephen Gaskin, an eclectic spiritual teacher whose outlook embraced, among other things, the use of psychedelics, Farm members were strict vegetarians who eschewed modern conveniences and dedicated themselves to building a new society and helping the less fortunate.

Coming as they did at a time of sweeping social change, the 1960s communes saw a good deal of social experimentation. Many of them tolerated, or advocated, the use of drugs, especially marijuana and LSD. Unconventional patterns of sexual conduct were widely embraced, although practice probably was not as flamboyant as theory. Rejection of the values of mainstream society was bedrock.

Amid the countercultural communes that got a great deal of attention in the press were a good many religious communities, some with rigid standards of belief and behavior. The Shiloh movement, the Children of God, and many others took in thousands of earnest young Christian believers—and often were the focus of a good deal of controversy for their alleged tight control of their members' lives and their intense

spiritual energy. Other communal groups grounded in Asian religions—the International Society for Krishna Consciousness; the Unification Church—were similarly intense and similarly controversial. But many of them continue to exist today.

By the end of the twentieth century, two new, or at least newly named, types of communities were occupying important niches in the larger fabric of communitarianism. One was cohousing, usually found in urban or suburban locations, in which clustered homes were built in a way that allowed owners as much privacy or community as they chose. They had complete (but small) individual homes as well as shared facilities, which typically included workshops, child-care facilities, tool sheds, guest rooms, and a kitchen and dining room large enough for the whole community to use. The other was the ecovillage movement, whose communities were usually located in rural areas and sought to promote lifestyles that were cooperative, largely self-sufficient, and environmentally as benign as possible. Ecovillages often used alternative building technologies (such as straw-bale construction), engaged in organic farming, and tried to minimize energy consumption.

And so the story continues. Hundreds of intentional communities from the American past are still active. Reba Place (founded in 1957 in Illinois), Twin Oaks (1967, Virginia), Jesus People USA (1974, Illinois), the Celo Community (1937, North Carolina), and a host of others are all quite alive and well. They stand as a testimony to the human imagination and to idealism. Their members put their lives and fortunes on the line to affirm what they saw as the essential humanity of all. Historically, communities have often been short-lived. Still, the tendency for the communities to break apart fairly quickly has not deterred new generations of seekers. As long as optimism remains in the human race, intentional communities will be with us.

Ethical Culture Movement

Founded by Dr. Felix Adler in 1876, Ethical Culture is a religious, educational, and social movement. The early history of Ethical Culture developed in response to the evils wrought by the industrial revolution. With a twofold commitment to both theory and practice, Ethical Culture has sought to anchor its social activism in moral ideals and a critical understanding of the sources of human oppression.

In accordance with a predominant current of nineteenth-century thought, Adler interpreted religion as an evolving phenomenon. He aimed to bring religion into modern times by creating a movement exclusively committed to ethical ideals, while eliminating supernatural belief and unscientific practices. Human dignity and interdependence lay at the heart of Adler's ethics. The mission of Ethical Culture then and now is to expand and deepen reverence for the worth of others as a vehicle to underscore one's own. It works to make primary the ethical factor in all relationships of life, ranging from the family to society, and ultimately the international arena.

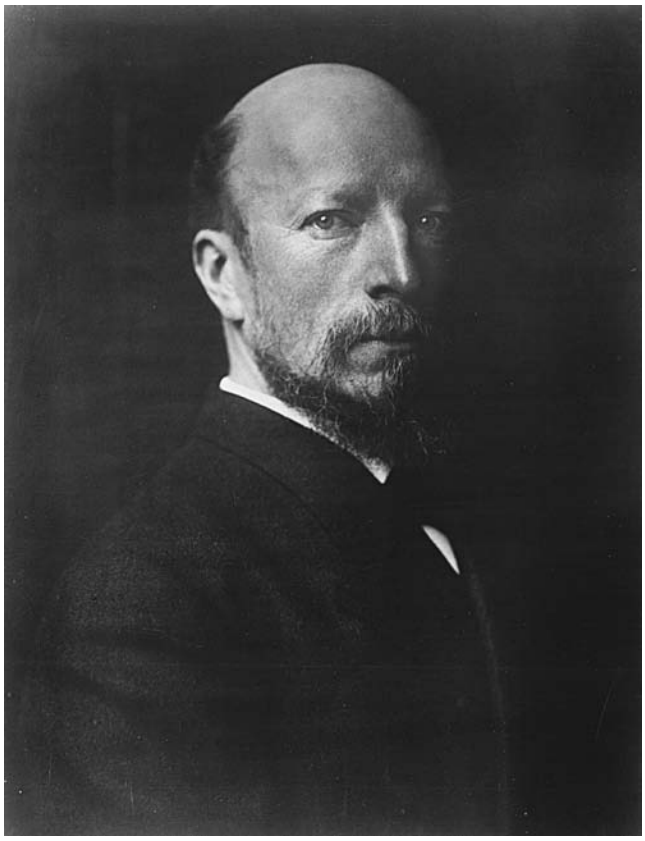
Ethical Culture Philosophy

On its philosophical side, Ethical Culture was born in what the historian of religion Sidney Ahlstrom has called "the Golden Age of Liberal Theology." It was a period in which religious thinkers were compelled to respond to Darwinism and its implication that man evolved by natural processes, and so lacked a special status conferred by divine creation. Science had great prestige in the nineteenth century, and liberal theologians sought to validate their religious speculations by harmonizing them with the scientific spirit and discoveries of the age. Adler was among these modernizers but remained troubled that science, which adequately described physical processes, could not sanction the absolute worth of the person. With Ethical Culture, Adler sought to create a new religious movement that would be "ultra-scientific without being anti-scientific."

Three major influences informed Adler's philosophy. Adler received his doctorate from the University of Heidelberg in 1873 and was greatly influenced by the moral and idealistic philosophy of Immanuel Kant, whose ethical thought he transformed in a more organic and social direction. Through creatively reworking Kant's concept of the "reality-producing processes of the mind," Adler found the transcendental reality by which to ground the absolute worthiness of the person.

Adler immigrated to the United States in 1857 at the age of six. He became inspired by the American democratic experience for which Ralph Waldo Emerson was a major spokesperson. Emerson had called for the emergence of a "purely ethical religion" in America, and Ethical Culture can be understood as a realization of Emerson's hopes. Adler also drew from Emerson's transcendentalism in his own construction of a spiritual universe, but paralleling his critique of Kant, he found Emerson's ideal of the "over soul" not sufficiently social.

Adler's background in Reform Judaism provided the third major influence on his thought. Adler's father, Rabbi Samuel Adler, who played a major role in liberalizing Judaism in Germany, later served as the second rabbi at the newly established Temple Emmanuel in New York. The Reform Judaism of the late nineteenth century was dedicated to the concept of "ethical monotheism" and was permeated with ideals of progress, rationalism, and universalism drawn from the European Enlightenment. The German Jewish community in America could be characterized by its meteoric economic success, a commitment to building social welfare institutions, and its desire for equality in Protestant-dominated America. Adler and many of his early followers who came from Reform Judaism reflected these cosmopolitan, high-minded sensibilities that were to animate Ethical Culture in its formative period. Ethical Culture attracted families identified with the German-Jewish elite who had



Born in Germany in 1851, Felix Adler established the Society for Ethical Culture in New York City when he was twenty-five years old. The Ethical Culture Movement emphasized the importance of moral values and judgment regardless of a supreme being. *(New York Society for Ethical Culture)*

prospered in the professions manufacturing and banking. Among them were Joseph Seligman, Lionel Sutro, Joseph Price, Henry Morgenthau, and Louis Bamberger.

Although Adler preached his own brand of ethical idealism from the Ethical Culture platform, he emphasized that Ethical Culture was founded on total freedom of conscience in matters of ultimate belief. This freedom, and Ethical Culture's dedication to social justice, were often expressed in the slogan "diversity in the creed, unanimity in the deed." For both Adler and his followers, religious devotion needed to be expressed in and through the world of social realities, with a view toward progressively transforming them by the light of the ideal. Adler referred to this work as "social reconstruction," implying that it was neither revolutionary nor simply reformist. In practical terms, much of the early work of Ethical Culture reflected a top-down approach to social change in which many of Adler's well-positioned followers were inspired to improve the conditions of the disadvantaged.

Ethical Culture and Social Reform

Ethical Culture was among several influential social reform movements that flourished in late nineteenth-century urban America and attracted an extraordinary cluster of talented visionaries and organizers. Among figures who were within the orbit of Ethical Culture in its early phase and worked with it toward common goals were such luminaries as Jacob Riis, Jane Addams, Lillian Wald, Booker T. Washington, W.E.B. Du Bois, Thomas Davidson, William James, and Walt Whitman. Samuel Gompers, the founder of the American Federation of Labor, was an enthusiastic member of the New York Society for Ethical Culture. Adler anticipated the Christian Social Gospel movement through his early emphasis on the moral dimension of Jesus' teaching. Like the Social Gospel movement, Ethical Culture was committed to applying religion to social reform, especially in the cities. Both movements were open to accepting new knowledge gleaned from the social sciences as an adjunct to liberal faith.

The problems of labor and industrial society consumed the passions of Adler and his followers. Endemic poverty, crowded, substandard housing, child labor, and deficient schools were among the problems these social reformers confronted. For some twenty years Adler had named "the social or labor question" as "the chief moral question of the day." According to Horace Friess, Adler's biographer,

> It was the growing edge of a new stage of society that he [Adler] saw in the general state and future prospects of industrial workers. It was a concern for the entire education and development of the workers, for their homes and families, their life structure and it was concern, as well, that they have a voice in the making of economic decisions. These economic, intellectual, and moral dimensions led Adler to view "the liberation of labor" as of crucial ethical moment to all society.

Within its first two years, Ethical Culture undertook several projects in the service of its mission that became characteristic of its approach to social reconstruction. In 1877, Ethical Culture hired several nurses to visit the poor in their homes and dispense their services free of charge. This program of "visiting nurses" later became a component of New York City's

health services and was permanently organized through the work of Lillian Wald and the Henry Street Settlement.

Around the same time, Ethical Culture established the first free kindergarten for the working poor on the Lower West Side of Manhattan. The Workingman's School eventually grew into an eight-grade elementary school, and then a high school, which, in contrast to the public and elite private schools, was dedicated to a progressive pedagogy of industrial education in which theory would be combined with practice. This early effort reflected Adler's lifelong commitment to education as a primary vehicle for social reform. The Workingman's School became the Ethical Culture School as members of Ethical Culture enrolled their own children and so diversified its class character. Adler's elaborated vision for the school, his "Fieldston Plan" (named for the area of the Bronx where the school was located), included prevocational training along with a broad liberal arts education. Though never fully realized within the confines of a single school, it did serve as a blueprint for such "magnet schools" as the High School of Music and Art and the Bronx High School of Science, among other outstanding components of New York City's public education system.

In the 1880s, as new waves of European immigration brought destitution to America's cities, Adler became a vocal member of New York State's Tenement House Commission. He advocated for humane, healthful living conditions, and he challenged the subterfuges of exploitative landlords, as he argued that profits on rent above 3 percent should be condemned as usury. His work with this state program inspired him to found the Tenement House Building Company, with E.R.A. Seligman, economist at Columbia College and Ethical Society member, as president. By 1887, the company had built six model tenements, which eventually benefited 3,500 families, on Cherry Street on New York's Lower East Side. These early projects reflected Ethical Culture's mode of activism in which, under Adler's inspiration, with the support of benefactors, the society would establish institutions that evolved to take on lives of their own, as their origins in the Ethical Movement receded to the background.

Expansion and the Settlement House Movement

In the 1880s, Adler recruited four professional lieutenants who moved Ethical Culture beyond New York City. William Mackintire Salter, S. Burns Weston, Walter Sheldon, and Stanton Coit came from liberal Protestant backgrounds. After pursuing graduate studies in Germany at Adler's behest, they respectively became the founding lecturers (later called "leaders") of Ethical Societies in Chicago, Philadelphia, St. Louis, and London, England.

In those urban venues, they continued the work Adler had begun in New York City. Weston devoted himself to settlement house work in Philadelphia, while Sheldon, building upon the traditions of freethinking Germans who had settled in the St. Louis area, created the Self-Culture Halls Association that replaced the educational work of the settlement houses without their emphasis on direct social action. In Chicago, Salter, concerned about legal representation for the poor, helped to found the Bureau for Justice, which in time evolved into today's Legal Aid Society.

Although the Settlement House movement is usually associated with Lillian Wald and Jane Addams, the first settlement house in the United States, Neighborhood Guild, today known as the University Settlement, was founded by Coit in New York in 1886. Based on a British model, and together with Madison House and the Hudson Guild, it marked Ethical Culture as a pioneer in this influential effort to teach immigrants American values, train them in needed job skills, and provide venues in which newcomers could learn the habits of democratic self-governance.

Adler's interest in childhood development went beyond the confines of formal education. Inviting new advances in children's psychology, the New York Society initiated the Visiting and Teaching Guild for Crippled Children and the Mothers' Society to Study Child Nature, the latter growing into the Child Study Association. Adler combined his interest in children with his analysis of the labor problem in his long presidency of the National Child Labor Committee, which he helped to found in 1894. Adler railed against the powerful commercial and industrial interests that exploited children in factories while denying them education. With the documentary assistance of the famed photographer Lewis Hine, Adler's committee paved the way for early legislation protecting the rights of the child.

In the last decades of the nineteenth century, there was no religious leader more sympathetic to the cause of labor in New York City than Felix Adler. Though he supported the trade union movement and its demands, his critique went far beyond advocacy of bread-and-butter issues. Adler believed that the labor movement was pivotal to bringing society to a new

stage of development. But as an idealist he averred that without the intellectual and moral education of both owners and workers, the movement limited itself to the materialism he saw represented by both capitalism and socialism.

Vocationalism and Women's Rights

Never a barricades activist, Adler possessed a temperament that found its expression in theoretical exposition, precise and eloquent oratory, organization, and mediation. In a series of twelve lectures given at the Summer School of Applied Ethics in Plymouth, Massachusetts, in 1894, Adler produced his most elaborate assessment of the labor problem. These lectures, which Adler considered his finest work, brought together scholars, among them Woodrow Wilson, as well as activists to discuss conditions and remedies of the labor problem.

At the center of Adler's commitment to labor was his theory of vocationalism. This meant that the worker needed to be fitted to his specific task to ensure that his or her work would serve as a vehicle for authentic personal growth. Moreover, in a way consistent with the organic character of all of Adler's ethical theorizing, each vocation needed to stand in right and mutually fruitful relations with other callings.

In 1910, the commitments of Ethical Culture were challenged when the garment trades called an industrywide strike involving 75,000 workers. Significantly, Ethical Culture members took leadership roles on both sides of the mediating process. Ethical Culturist Julius Cohen served as lawyer for the manufacturers, while Henry Moskowitz, who joined Adler in professional leadership in 1907 and helped to found Madison House, worked tirelessly with his wife, Belle, to help reach a solution. Moskowitz called upon department store magnate A. Lincoln Filene, whose interests had been adversely affected by the strike. Filene, a fellow Ethical Culturist, in turn prevailed upon a young Boston lawyer, Louis Brandeis, to serve as arbitrator. Brandeis, Adler's brother-in-law, served under Adler's chairmanship of the Council of Conciliation, which grew out of the strike settlement.

Adler, in a way that expressed his Victorian values, did not support women's suffrage, asserting that it would worsen an already faulty electoral system. Although he supported separate social spheres for women and men, he nevertheless advocated for women's education and the need to learn a trade as a hedge against spousal abandonment. Despite his conflicting views, Adler recruited as a colleague the Unitarian Anna Garlin Spencer, in 1894. Spencer was a suffragist, pacifist, and vice president of the Women's International League for Peace and Freedom. Unable to find a satisfying professional place in Ethical leadership, she resigned her position ten years later to become a founder of Columbia University's School of Social Work.

New Leadership

The year 1894 also saw the entry of John Lovejoy Elliott into the ranks of Ethical Culture's leadership. Elliott was chosen to become Adler's successor as the senior leader of the New York Society, upon Adler's death in 1933. Adler and Elliott provided a study in complementary contrasts. Elliott, who hailed from Illinois, came from an abolitionist family with deep Midwestern roots. While Adler was philosophical and aloof in his personal relations, Elliott immersed himself in the grit of human experience. Never a high-minded orator, Elliott's personalism exemplified a new style of Ethical Culture leader as social worker.

Elliott chose to live in the proletarian, rough-and-tumble neighborhood of Chelsea, on New York's Lower West Side among the Irish immigrant poor. Believing in the inherent goodness of the common man, he was committed to helping the powerless learn to help themselves.

Elliott's work centered on building the Hudson Guild Settlement, which brought him into daily contact with the destitute, youth gangs, and criminals. With financial assistance from Ethical Culture's uptown members, Elliott was able to build printing shops and create an employment bureau, a model tenement of its own, and a 500-acre farm in western New Jersey.

Through his prominence and success as a spokesperson for the disadvantaged, Elliott developed notable associations and friendships, which he used to good advantage. Frequently, he would appeal to New York's mayor Fiorello La Guardia or Eleanor Roosevelt to help win bail or a pardon for a prisoner whose case he was championing. Elliott's intercession on behalf of imperiled individuals took him to Berlin in 1938 to help secure the release from the Nazis of Dr. Wilhelm Boerner and Walter Eckstein, leaders of the Vienna Ethical Society. This experience inspired the New York Society to establish programs to help refugees adjust to American society while supplying them with needed food and clothing. Out of this work grew the Good Neighbor Association, a national effort with Elliott as chairman, New York Society member James Hart as executive, and Eleanor Roosevelt as honorary chairman. Though well launched, the asso-

ciation's work was cut short in 1941 by America's entry into World War II.

Through his productive career, Elliott bridged two worlds: He was a beloved figure to members of Ethical Culture and its young people, and a local hero to the poor on whose behalf he so arduously labored.

The Movement Declines

Elliott's style and commitments came at a time of change in the class character and philosophical underpinnings of Ethical Culture in the decades preceding Adler's demise. Idealism, which had been the regnant philosophy in nineteenth-century Europe, reached a dead end on America's shores, to be replaced by variants of naturalism, instrumentalism, and pragmatism. William James and John Dewey were the major exponents of this distinctly "American" approach in philosophy, inspiring former leader Edward Ericson to observe that Ethical Culture was "the movement that Adler built and Dewey, through his followers, so quickly inherited." With this shift in ground, Ethical Culture began to assume the mantle of a "humanist" organization, a term Adler shunned for its emphasis on human ends devoid of the spiritualizing dynamics inspired by transcendental ideals.

As new immigrants found their way to Ethical Culture, Adler's idealism simultaneously receded. The movement became a broad tent under which liberals, agnostics, atheists, Socialists, and activists could find a welcoming home. Adler's death also spurred a problem of succession and focus for the Ethical Movement, as preoccupation with institutional concerns grew, while the self-confidence characteristic of Ethical Culture in early path-breaking decades began to diminish. The social mission of Ethical Culture continued nevertheless as the defining center of its identity and activity.

Ethical Culture's Achievements

Although its precise origins are somewhat vague, there can be no doubt that Ethical Culture played a pivotal role in the founding of the National Association for the Advancement of Colored People (NAACP) in 1909. Elliott, Spencer, Salter, and Moskowitz were signatories of the NAACP's founding charter and represented Ethical Culture's early interest in race relations. Adler, who was a frequent lecturer at black colleges, organized the world's first international conference on race, held in London in 1911. Adler himself was one of the two American delegates to that conference; WE.B. Du Bois, the great African-American intellectual and activist, was the other.

Roger Baldwin, who was first introduced to Ethical Culture in St. Louis and later affiliated with the New York Society, founded the American Civil Liberties Union in 1920 as a response to government repression during the Palmer Raids and to render support to conscientious objectors to World War I. Elliott was a key participant in the ACLU's founding group, initiating a long-standing relationship between the two organizations.

Between 1893 and Adler's death in 1933, sixteen new individuals entered leadership, full or part time, to carry forward Ethical Culture's mission. Most of these leaders, such as David Muzzey, a noted historian who taught at Columbia University for many years, and Percival Chubb, who worked in Societies in England, New York, and for decades in St. Louis, distinguished themselves as educators and orators. Another activist to be added to the list that included Elliott, Spencer, and Moskowitz was Henry Neumann. Neumann became a leader of the Brooklyn Society in 1911 and served the Ethical movement professionally as a much-beloved personality until his death in 1966. Neumann, whose pacifism had caused rifts in the Ethical movement during World War I, was not less committed throughout his life to advocating for democratic socialism in the mold of Norman Thomas.

It was the youngest of the new generation of leaders recruited under Adler's tutelage who would go furthest in identifying Ethical Culture with progressive social change in the mid- and late decades of the twentieth century. Algernon D. Black, a son of working-class Russian Jews, was born in 1900. Educated at the Ethical Culture schools and receiving his B.A. in economics from Harvard, Black personified an activism that blended moral idealism with a strong economic analysis of social injustice.

A man of dynamic and charismatic presence and grandiloquent oratory, Black became synonymous with Ethical Culture for uncountable thousands who heard him from the Ethical platform and for decades as a commentator on New York's WQXR radio station. Although his activist commitments ranged broadly, Black became identified primarily with the causes of racial justice, workers' rights, affordable housing, civil liberties, and antifascism, and he was a forceful paragon of the democratic left in America, the Cold War era, and the civil rights movement. Though never a strong institution builder within Ethical Culture, Black taught ethics for four decades at the Field-

ston School, and his skills as a storyteller helped to mold the values of generations of children.

In the 1930s, Black spoke out forcefully against fascism in Spain, as he did against the Nazi onslaught in Europe several years later. Often a polarizing force in a movement hesitant about ideological zeal, Black supported a Worker's Fellowship in the New York Society, which many suspected had been infiltrated by the Communist Party in the 1940s.

Typical of Black's activism was the early assistance he gave to striking silk workers who were trying to organize in Paterson and Lodi, New Jersey. In 1941, Black became the founder and chairperson of the Citizens Committee for Harlem, and he was a prime mover in the development of the New York State, and later, the National, Committee Against Discrimination in Housing. Black served for years on the board of the NAACP and became vice president of the organization in 1950.

Both the leadership and laity of Ethical Culture have found the cause of civil liberties close to the center of the movement's commitment to preserving human dignity and freedom. Black, who had worked on behalf of labor with Roger Baldwin, served for years on the board of the American Civil Liberties Union, as John Elliott did before him, and as colleague Sheldon Ackley would later. His dedication to civic activism was duly recognized when Mayor John Lindsay of New York appointed Algernon Black as the chairperson of the controversial and short-lived Civilian Police Review Board.

No project reflected the scope of Black's political vision and the depth of his humanism more than the creation of the Encampment for Citizenship. In the mid-1940s, Black initiated the Work Camps for Democracy, which blossomed into the Encampment for Citizenship soon after World War II. Infused with the energies of suffragist Anita Politzer and the enthusiastic endorsement of Eleanor Roosevelt, the Encampment served as a radical experiment in democratic living and action in the years before the dawn of the modern civil rights movement. The Encampment brought together in a residential setting first college-age and then high school students from different racial, ethnic, and class backgrounds for classes and workshops in progressive community action. Classes and workshops were held in various sites in the United States, and participants were invited to Hyde Park, New York, to meet with Mrs. Roosevelt. For fifty years, the Encampment nurtured distinguished alumni of its own, including the activist congressman Allard Lowenstein; David Rothenberg, guiding light of the ex-prisoners' support organization the Fortune Society; Simeon Golar; and Eleanor Holmes Norton. Golar and Norton would become commissioners for human rights in New York City, and later Norton served as Washington, D.C.'s, nonvoting representative to Congress.

The role of Ethical Culture in providing a voice against the repression of the McCarthy era cannot be overstated. According to a movement historian, Howard B. Radest, "When McCarthyism was at its height, the New York Platform was one of the few places where public criticism was heard." Black's protest was the most outspoken of all, but he was joined in denouncing the Red Scare by Neumann and his colleague in New York, the liberal Deweyan Jerome Nathanson.

During the 1960s, Ethical Culture plied its work on the progressive landscape, in civil rights, in organizing against the American war in Vietnam, and in safeguarding civil liberties. Primarily through its national organization, the American Ethical Union, Ethical Culture continued to support public education, the separation of church and state, the rights of nontheistic conscientious objectors, and women's rights, and was especially active in securing a woman's right to a safe and legal abortion. Often this work was carried forward in coalition with kindred organizations, such as the Unitarian-Universalist Association and the American Humanist Association.

In the last decades of the twentieth century and into the current one, the cutting edge of Ethical Culture as a social movement has been more difficult to sustain. Unlike its golden period in the nineteenth century, many human services that it had pioneered have been absorbed by government programs, especially since the decades of the New Deal and the Great Society. Moreover, peopled primarily by middle-class professionals today, Ethical Culture lacks the formidable financial resources it once claimed, while volunteer activism has become broadly characteristic of the contemporary American ethos.

Although the history of Ethical Culture is most readily recounted through the initiatives of its illustrious individuals, it has always been a congregational movement, fulfilling the social and religious needs of its members and associates.

Today, Ethical Culture remains a progressive redoubt standing against the irrationalism and intensive subjectivism of the postmodern era. Its thirty societies in the United States serve as vital communities for humanists sensitive to the pressures of excessive consumerism in American life. Through its moral ed-

ucation programs for children, its humanistic ceremonies celebrating the life passages of birth, marriage, and death, and its enduring emphasis on the primacy of ethics and human dignity, Ethical Culture remains a distinctive and significant movement on the American landscape.

As Ethical Culture looks to the future, it rests upon a proud historical legacy. As the only "religion of humanity" founded in the nineteenth century to endure into the twenty-first, Ethical Culture, though never claiming more than 6,000 members, has served as a pioneering "gadfly" movement in American social history. Through its platforms, schools, camps, and numerous social institutions it has founded but which have achieved independent lives of their own, Ethical Culture has improved the well-being of countless thousands, while inspiring many more to live meaningful lives of deeper moral and social commitment.

Health Food Movement

Characteristics of the Health Food Movement

From its origins in the nineteenth century, the American health food movement has been loosely organized and diverse in character. Some scholars argue that the movement is more accurately described as a consumer lifestyle consisting of the similar yet disconnected food choices of millions of individual shoppers. On the contrary, the historical and contemporary significance of the health food movement is much more meaningful than the creation of a mere "market niche." The health tradition, in fact, has a long history of activist leaders and committed followers, cogent belief systems and ideologies, a network of organizations, independent businesses, and corporations that distribute nutritional information and health food products, and increasingly, millions of adherents whose everyday food choices are informed by ethical, environmental, political, and nutritional considerations.

Several important trends have marked the health food movement from its inception. The health food tradition is rooted in three major American reform movements of the nineteenth and twentieth centuries. Its leaders, ideologies, and organizations emerged during the Second Great Awakening, became popularized and institutionalized from the late nineteenth century through the Progressive Era, and matured in the wake of the cultural and political upheavals of the l960s and 1970s. The contemporary cultural climate and political issues of these major reform eras determined the character of health reforms in each period. For instance, Protestant reformers such as William Metcalfe, "moral physiologists" including Sylvester Graham and William A. Alcott, and new religious sects such as the Seventh-day Adventists led by Ellen G. White and James Harvey Kellogg preached a message of health for morality and salvation, giving the movement a distinctly religious and ethical tone during the nineteenth century. Public health, sanitation, and disease prevention occupied the attention of health reformers during the Progressive Era. The cultural and political radicalism of American youth, their critique of mass, homogenized food production, and their concern for the environment intertwined to inspire and popularize the natural foods movement of the 1960s and 1970s.

Health reformers in every period have been both reactionary and visionary. Consistently throughout the nineteenth and twentieth centuries, they critiqued America's food production and distribution system, challenged conventional medical doctors, and questioned the authority of scientific experts to decide matters of health, nutrition, and healing. Health reformers have just as often offered idealistic, ethical, and moral visions for individual and societal reform. Arguing that the solution to societal ills lay in cultivating the relationship between physical health, spiritual well-being, and human potential, health reformers in every period have optimistically searched for a holistic way to maximize human performance. Eating certain healthy foods and abstaining from others, they believed, could result in a physically healthy and spiritually enlightened society. By the end of the twentieth century, environmentally minded health food advocates argued that by choosing carefully the foods they consumed, Americans could live their politics "365 days a year, three times a day," contributing to personal vitality while taking social responsibility in an interdependent global community.

The "Christian Physiologists" and the Holistic Tradition

The nineteenth-century American health food movement emerged from the religious revivalism of the Second Great Awakening. Reformers like the Protestant minister William Metcalfe, temperance and health

food advocate Sylvester Graham, and physician William A. Alcott encouraged Americans to follow dietary restrictions and other hygienic reforms (temperance, loose clothing, fresh air, exercise) as part of a plan for improved moral, spiritual, and physical health. Their ideas about health were rooted in the common belief that caring for the body, "the temple of God," was a sacred, religious duty. Historians consider these three "Christian physiologists" to be the founders of the American health food tradition.

Metcalfe, an English immigrant and founder of the Bible Christian Church in Philadelphia (1817), was one of the first reformers to argue for a direct correlation between food choices and spiritual health; in addition, he brought vegetarianism to the United States through his sermons and his book *Abstinence from the Flesh of Animals* (1827). In 1830, Metcalfe hired temperance reformer Sylvester Graham (1794–1851) to lecture at the Bible Christian Church. Combining his teachings on temperance with Metcalfe's proscriptions for health, Graham developed a regimen for healthy living based on strict dietary and hygienic guidelines. He claimed that all "stimulation" was potentially health threatening and warned Americans to avoid "flesh foods," alcohol, tea, coffee, spices, and frequent sex; the proper diet, Graham contended, consisted of wheat bread and grains, fresh fruits, vegetables, and nuts. Graham was especially critical of commercially processed breads, arguing that greedy bakers contaminated bread with "bean flour, peas and potatoes, chalk, pipe clay, and the plaster of Paris." Instead of purchasing bread in the market, Graham advised Americans to bake their own whole-grain "Graham bread." His holistic teachings, more secular than religious in nature, became so popular that contemporaries labeled them "Grahamism."

Although Graham's name became synonymous with the early health food movement, he did not work alone. His contemporary and cohort, Connecticut physician William A. Alcott (1798–1859), played an important role in the movement, warning Americans to stay away from "stimulating" foods, especially meat. Influenced by his cousin Amos Bronson Alcott, who founded the vegetarian commune Fruitlands, William Alcott argued that a "vegetable diet lies at the basis of all reform, whether civil, social, moral, or religion." In approximately 100 publications on diet, health, and ethics, he steadfastly advanced his simple argument: you are what you eat! Alcott warned Americans that "diseased food causes disease in the people who use it."

Graham and Alcott proactively advocated self-responsibility for disease prevention and health, but their philosophies also represented the popular reaction and disgust that Americans held for the painful and ineffective conventional medical treatments of the day, such as blistering, bleeding, and purging. It is likely that the broad appeal of the Christian physiologists relied on their ability to synthesize useful practices from both conventional and alternative medicine and offer the public more choices for health care. For instance, Graham and Alcott combined ideas from Shradrach Ricketson's *Means of Preserving and Preventing Disease* (1806) and botanist Samuel Thomson's *New Guide to Health; or Botanic Family Physician* (1822); they also incorporated homeopathy and hydrotherapy into their teachings.

In 1837, Graham and Alcott took the first steps toward institutionalizing the health food movement. They founded the American Physiology Association to promote holistic health reforms and established a health food store that sold Graham bread, fruits, nuts, and vegetables grown in "virgin, unfertilized soil." They also sponsored "physiological boarding houses," requiring tenants to follow a vegetarian diet, sleep on hard beds, take cold baths, and exercise moderately.

Institutionalizing the Health Food Movement

As Grahamism reached the apex of its popularity at mid-century, American reformers supplemented its holistic philosophy with hydrotherapy (water treatments that included bathing, exercising, massage, and sweating). Joel Shew, a New York physician, opened the first hydropathic establishment in 1844, and by 1870, 200 "water-cure" institutions existed in the United States. The most important of these resorts, Our Home on the Hillside, opened by James Caleb Jackson (1814–1895) in Dansville, New York, offered visitors a combination of Grahamism, hydropathic cures, and social activities such as lectures, concerts, dances, and plays. Our Home also marketed a line of health foods, including a coffee substitute, Graham bread, and Granula—a nonperishable alternative to Graham bread.

One of the most important visitors to Our Home was Ellen G. White, a founder and prophetess of the Seventh-day Adventist Church (SDA). White had begun to incorporate the ideas of the early Christian physiologists into the doctrines of the SDA church by the late 1840s, but after a visit to Our Home followed

REVIEW OF *HYDROPATHY; OR THE WATER CURE*

Hydropathy, or the water cure, became a popular medical treatment in the mid-nineteenth century. Joel Shew began his hydropathic practice in 1844 in New York and a year later expanded his practice to New Lebanon Springs, New York. Shew was a prolific writer and contributor to many publications on hydropathy and water cures.

10. *HYDROPATHY; or the Water Cure: Its principles, processes and modes of treatment*. Compiled in part from the most eminent authors, ancient and modern, on the subject. Together with an account of the latest methods adopted by Priessnitz, & c. By Joel Shew, M.D. Third edition. John Wiley, 161 Broadway.

Hydropathy, as a curative science, has certainly made greater progress in the last few years than has either Allopathy or Homeopathy, and we think for the general preservation of health, as well as a remedy for most disorders of the system, its growing reputation is deserved. That the medical science has been so backward in improvement in an age when all others have made such rapid advances, may be taken as evidence of the existence of some radical error in principles, and want of confidence in its professors—certain it is, that when personally afflicted, none show so great distrust of the efficacy of remedies they daily prescribe others, as physicians themselves. That many acute diseases will temporarily yield to a certain course of treatment, and that experience in relation to the physical condition of the patient as a guide to the application of those remedies seems to be the sum total of medical science as it exists. Beyond that there is no help in medicine. How helpless does the profession appear in the presence of the prevailing epidemic, which now for the third time is devastating the country! That Hydropathy, which eschews all drugs, is the true system, we do not assert; on the other hand, with many constitutions it does not agree at all. In very many, however, it is of great service, and few can read the work of Dr. Shew without being attracted by its merits.

by several prophetic visions on health, White convinced her parishioners to fund and build the Western Health Reform Institute in 1866 (later renamed the Battle Creek Medical and Surgical Sanitarium). Destined to become the leading scientific institution of the health food and vegetarian movements, the San (commonly used name for this first Seventh-day Adventist health institution in Battle Creek, Michigan) functioned in obscurity until 1876, when Dr. James Harvey Kellogg (1852–1943) assumed leadership, announcing that the institution would become a "university of health" where "people learn to stay well." To fulfill this mission, Kellogg established an experimental kitchen at the San where he churned out the nation's first popular cold breakfast cereals—Granola and Sanitas Corn Flakes, a palatable peanut butter, and high-protein meat substitutes like Battle Creek Steaks and Battle Creek Scallops. Through institutions like the Battle Creek San, which had hosted 300,000 visitors by 1943, including President William Howard Taft, J.C. Penney, and Montgomery Ward, SDAs institutionalized, popularized, and legitimized the health food movement of the nineteenth century, creating an infrastructure of research institutions, hospitals, and health food stores staffed by experts trained in health and nutrition.

Noting the popularity of the health food movement in his book *Eating for Strength* (1888), Dr. M.L. Holbrook wrote: "In no period of the world's history has there ever been so deep an interest in the subject of foods as at the present. . . . It would almost seem as if the time had nearly arrived when mankind would eat to live, would feed themselves so as to nourish their bodies most perfectly and render themselves capable of the most labor, and least liable to diseases." Holbrook's reference to food as the basis of worker efficiency and disease prevention signaled a turning point in the movement as Progressive Era health reformers, armed with scientific expertise and a determination to bring order to America's burgeoning immigrant-industrial cities, turned to public health issues such as sanitation, disease prevention, and regulation of industrial food production. By the 1930s, the holistic health message of Grahamism and the Christian physiologists, though institutionalized by the SDA Church, had faded into obscurity in the mind of the American public behind the harsh realities of world war, a decade of cultural liberalism, and the Great Depression.

JOHN HARVEY KELLOGG (1852–1943)

John Harvey Kellogg, a leading advocate of healthy living and nutrition, was born on February 26, 1852, in Tyrone, Michigan, to John Preston Kellogg and Anne Jeanette Stanley, devout Seventh-day Adventists. In 1866, at the Health Reform Institute, Kellogg was educated in the water cure, known as hydrotherapy, which he later rejected. After receiving medical training at Bellevue Medical College in New York and becoming a medical doctor, Kellogg became editor of the Seventh-day Adventist monthly, *Health Reformer*, renamed *Good Health* in 1879. Dr. Kellogg returned to Michigan and in 1876 became superintendent of the Battle Creek Sanitarium.

Kellogg developed a "biologic living" dietary approach that was based on the notion of "natural living," vegetarianism, asceticism, and abstinence. Later, with his brother Will, Kellogg produced and marketed corn flake and rice flake cereals sold through mail order. The company, initially known as Sanitas Food Company, grew dramatically. Conflicts between the two brothers led to a formal split in 1906. Despite legal challenges, Will gained rights to the renamed W.K. Kellogg Company, which would become a multinational cereal company. John, less successful in his business than Will, established the Battle Creek Food Company, which sold a variety of health foods, including coffee substitutes and soybean-derived milk. By 1907, Kellogg was excommunicated from the Seventh-day Adventist Church because of his independence of thinking and differences over his business ventures. A prolific writer, Kellogg actively participated in the eugenics movement, founding the Race Betterment Foundation. Kellogg died at the age of ninety-one on December 14, 1943. At the time of his death, Kellogg held more than thirty patents for food products and various exercise, diagnostic, and therapeutic machines.

THE "COUNTERCUISINE"

By the mid-twentieth century, the health food movement consisted of a few institutions, such as the SDA church, local vegetarian societies, and determined individuals such as J.I. Rodale and Adelle Davis. Generally referred to as "health nuts" in the popular culture, they kept the movement alive until the late 1960s, when America's youth, swept up in a maelstrom of cultural and political radicalism, recognized that "the personal is political," consciously reconsidered their food choices, and reinvigorated the health food movement.

The SDAs continued to play an important role in the health food movement throughout the twentieth century by establishing research institutions such as Loma Linda University, health food corporations like Worthington Foods, the vegetarian restaurant chain Country Life, and numerous publications on health and nutrition. Independent health food stores served similar functions in communities across the nation; distributing health food products, including meat substitutes, teaching interested Americans about alternative food choices, and serving as community centers for health food advocates.

Although they were dismissed as "crackpots" and conspiracy theorists by scientists and the medical professionals during the 1950s, pioneering health food reformers such as J.I. Rodale and Adelle Davis continued to criticize America's system of "unnatural" food production and encouraged consumers to search for alternatives. Rodale, founder of the Rodale Press and publisher of *Organic Gardening and Farming* and *Prevention*, lambasted mechanized monoculture agriculture and decried the use of dangerous agrochemicals in food production. Americans, he argued, should turn to "organic farming": a system of sustainable agriculture that acknowledged the ecological interdependence of soil, plants, animals, and people. Davis, also a critic of food production, argued that food corporations were poisoning Americans with dangerous additives like cyclamate.

Most Americans refused to hear the warnings of these "health nuts." Although Rodale preached organic and Davis warned about the dangers of additives, middle-class Americans baked casseroles with canned soups, enjoyed canned vegetables and processed cheeses, and gobbled down convenience foods—a Swanson's TV Dinner of turkey and stuffing could be had for only ninety-eight cents. Most important, Americans "cooked out" and consumed massive amounts of meat: sales of outdoor cooking equipment had topped 30 million dollars a year by the mid-1950s, and meat consumption rose from 121.7 pounds per year in 1930 to 160 pounds per year in 1970.

As historian Warren Belasco has written in *Appetite for Change: How the Counterculture Took on the Food Industry, 1966–1988* (1989), "In the late 1960s, young cultural rebels began to turn against mainstream foodways" to develop a countercuisine. The counterculture's experimentation with health foods began with a rejection of standardized, fabricated, convenience

foods like canned vegetables, Tang, Carnation Instant Breakfast, and Pringles, in favor of fresh fruits and vegetables, whole grains, beans, brown rice, and yogurt. Finding grains, rice, and beans in bulk at natural food stores and cooperatives, scooping out what one needed, and labeling the product fit well with the youth culture's search for eccentric, "authentic" experiences. At the same time, the product diversity, absence of brand names, and minimal packaging became a means by which to reject mass food production and homogenized supermarkets like Safeway, Giant, and A&P. Between 5,000 and 10,000 food cooperatives opened between 1969 and 1979, grossing an estimated $500 million per year.

The countercuisine became increasingly politicized after 1970 as activists considered the consequences of diet for American society and the environment; radicals criticized food production, and extremists such as Dick Gregory suggested a connection between poor diet and American intervention in Vietnam. Events at People's Park, an oil spill off the California coast, smog alerts in Los Angeles, news stories on DDT and cyclamates, and Paul Ehrlich's book *The Population Bomb* (1968), which predicted soil erosion, worldwide famine, and nuclear war from "runaway food and population pressures," catapulted environmentalism to the top of the radical agenda. Francis Lappé's *Diet for a Small Planet* (1971), in turn, directly linked food choices to environmentalism by explaining the global ecological consequences of a meat-based diet. Lappé argued that the nation's vegetable protein crops (grains and soy beans) should be consumed directly by humans instead of stock animals. Explaining that "an acre of cereals can produce five times more protein than an acre devoted to meat production; legumes can produce ten times more; leafy vegetables fifteen times more," Lappé claimed that by adopting a more agriculturally efficient vegetarian diet, Americans could alleviate world hunger. Lappé's hope that collective personal choices could make a social impact, her evidence that a vegetarian diet was nutritionally adequate, and her collection of recipes inspired and guided a generation of vegetarians and health food advocates. Dick Gregory, in *Dick Gregory's Natural Diet for Folks Who Eat: Cookin' with Mother Nature* (1973), argued that diet was at the root of America's foreign policy problems: "I think one of the reasons we have so much overweight and overeating in these United States is that America is insecure. In her security, America raids the refrigerators of Southeast Asia, wipes out the pantry of Latin America, munches and snacks on the freedom of people all over the world."

Mainstreaming the Movement

By the mid-1970s, the values and consumer preferences of the counterculture had become a powerful political lifestyle, defining health foods as foods with no synthetic ingredients, minimal processing, in as close to a whole and natural state as possible. As a result, the counterculture laid the foundation for the growth of the multibillion-dollar natural foods industry. Mo Siegel, founder of Celestial Seasonings Corporation, was one of the first "hip" capitalists to turn the tastes and philosophies of the countercuisine into big profits. His company had its beginnings in 1969 when Siegel, a nineteen-year-old hippie, and his friends conjured their first blend of teas called "Mo's 36 Herb Tea" in a barn outside of Boulder, Colorado, packaged it in hand-sewn muslin bags, and sold it to the Green Mountain Grainery—one of Boulder's health food stores. The success of hip entrepreneurs like Siegel depended on their ability to appeal to counterculture values by marketing their companies as socially useful and morally legitimate institutions. Siegel, for example, advertised his company's mission statement—"to create and sell healthful, naturally oriented products that nurture people's bodies and uplift their souls, and to make the world a better place by unselfishly serving the public"—and it quickly paid off. In 1970, he earned $2,000; in 1973, the year that Celestial Seasonings incorporated, the company made a profit of $1.3 million; by 1978, the company employed 200 people and earned $9 million per a year.

The success of Celestial Seasonings and other hip health foods corporations represented the mainstreaming of the health food movement and the birth of the "Lifestyles of Health and Sustainability Market" (LOHAS), a $230 billion industry, in 2002. Several factors propelled the health food movement into mainstream American culture after 1980. Many medical doctors, including Andrew Weil, Dean Ornish, and Julian Whitaker, argued for healthy eating as a central component of preventative and alternative medicine, giving the holistic philosophies of health foods reformers the authority of scientific expertise. The American Dietetic Association officially endorsed vegetarianism in the 1990s, and the U.S. government replaced the four food groups guidelines, which had emphasized the importance of meat and dairy products, with the food pyramid, informing the public that a healthy diet consists predominately of vegeta-

bles, legumes, and fruit. Finally, Congress passed the Federal Organic Foods Production Act in 1990, and the United States Department of Agriculture implemented the legislation in 2002. At the core of the LOHAS market are 10 million vegetarians and 8,000 natural foods retailers, including the natural foods giants Wild Oats Corporation and Whole Foods Corporation. One-half of conventional grocers now carry organic foods, and Americans' fast-food choices include wraps, smoothies, and garden burgers. As the health food movement approaches full circle from its religious infancy through its grassroots adolescence to its current status as an important retail market, it faces many complex challenges heading into the twentieth century. As a progressive force in American society, health reformers must deal with new and pressing issues such as the genetic modification of food, the preservation of community-based organic farms and natural foods outlets, and the co-opting of natural foods concepts by multinational corporations.

COUNTERCULTURE MOVEMENT
1960s–1970s

Mention of "hippies" or "the counterculture" often conjures an image of long-haired young men wearing tie-dyed tee-shirts and young women dressed in "granny" skirts, smoking marijuana, enamored of rock and roll, and flaunting their sexual freedom to the dismay of their elders. This reduction of the counterculture to the hedonistic pursuit of "sex, drugs, and rock and roll" often obscures the complexity, diversity, and seriousness of the phenomenon. Scholars are only now beginning to examine the counterculture as an important form of social protest during the 1960s and 1970s.

LOCATING THE COUNTERCULTURE

What place should the counterculture occupy in the history of American social movements? Who were the "hippies," and what did they contribute to the panoply of movements for social change that arose in the 1960s? This question has proved difficult to answer because the counterculture was a diffuse phenomenon that defies categorical understanding.

The cultural radicalism of the hippies and the instrumentalist politics of the New Left originated among distinct populations of radical youth in the early and mid-1960s. However, hippies and New Leftists interacted intensely with one another during the mid-1960s, as youth radicalism grew exponentially on college campuses and in urban, bohemian enclaves. However, by the late 1960s, neither formation constituted a discrete population. So many New Leftists incorporated countercultural styles, projects (such as communal living), and analysis into their organizing efforts, and so many hippies likewise found themselves moved to participate in demonstrations and to speak out against the machinations of corporate America that the two formations became integral parts of a larger whole. Therefore, it is most accurate to say that the counterculture and the New Left became *tendencies* within a larger movement of Euro-American youth activists, known at the time simply as "the Movement." What, then, distinguished these two tendencies from one another?

The New Left took a materialist approach to the analysis of the problems of American society, seeing inequality and individual alienation as problems primarily of *structure*, and only secondarily as problems of individual *consciousness*. They adopted Marxism's insistence that individual beliefs and feelings derive from the way in which society organizes power, work, and resources. People who lack the resources to force other powerful people to heed their concerns *feel* powerless and insignificant because elites exclude them from participation in decision making about what should be produced, how it should be produced, and how valuable such work is to society as a whole. These fundamental "relations of production," in turn, structure all other social relationships, even those not directly pertaining to work. Accordingly, New Leftists sought to reverse these feelings of powerlessness by organizing poor people for united action.

Counterculturalists developed an analysis of America's social ills as originating primarily in the repressive organization of individual *consciousness.* In their view, inequalities of social structure figured more as the effect, rather than the cause, of the profound alienation from which all Americans suffered. For most citizens, the material abundance and technological sophistication of the post–World War II period seemed to confirm the power of science to explain the universe in rationalistic terms. Yet, hippies noted profound incongruities between public and private life. They argued that urban life alienated citizens of industrial civilization from the natural world, and thus from their own fundamental

These "hippies" gathering at a site in Sultan, Washington, on September 3, 1968, for the Sky River Rock Festival, find themselves dancing in mud created by heavy rains. *(AP Wide World Photos)*

nature as members of an animal species. Furthermore, they argued, the heavily bureaucratized routines and authoritarian structure of work, and the emotionally empty practice of modern religion, reduced human beings to what they regarded as a state of spiritual passivity.

To compensate for this alienation, advanced industrial society offered Americans the opportunity to participate in a consumerist regime, driven not by genuine demand, but by a propagandistic marketing apparatus. As a result, said the hippies, Americans lived in a conformist society, and one increasingly devoid of genuine beauty and opportunities to develop individual creativity. Furthermore, the deluge of consumer products and marketing messages, combined with the anxieties attendant to career and property ownership, made genuine alternatives to the status quo increasingly difficult to imagine.

The appropriate response, as hippies saw it, was to liberate the instinctual, human animal from the self-imposed repression attendant to "progress." The individual quest to recover their repressed, animal instincts, to experience spiritual ecstasy, and to infuse daily life with artistic beauty, generosity, and genuine fellow feeling, would prepare the individual to initiate new ways of organizing all of the facets of social life. The new, liberated society would rise spontaneously amid the old.

The Counterculture's Diverse Forms of Opposition

Hippies agreed widely on the need for the liberation of consciousness. However, they never reached consensus on the best means by which to accomplish that liberation. Two primary schools of thought about countercultural praxis emerged among the most committed cultural radicals.

Beginning in 1966, a group known as the Diggers became the most celebrated advocates of anarchism as the most effective means by which to transform the American consciousness. The Diggers defined freedom as the complete absence of imposed rules. They believed that imposed authority of any kind robbed individuals of the freedom to organize their lives according to the dictates of self-knowledge and experience. Imposed rules also robbed individuals of the *responsibilities* that came with freedom: to deal with others in complete good faith, honesty, and with brotherly generosity; to accept others' difference from oneself; and to accept the consequences that followed from one's choices.

The Diggers charged that Americans suffered from an unhealthy dependence on leaders and institutions to make choices for them. Americans, they said, also behaved hypocritically in their private lives—for example, proclaiming the sanctity of the family while practicing adultery. It would be better, said these hippie anarchists, to abolish *both* institutions and allow free individuals to negotiate relationships on a more authentic basis.

Most of the founding Diggers had been members of the radical San Francisco Mime Troupe. Dissatisfied with the Troupe's structure and practice, several members, including Peter Berg, Emmett Grogan, Judy Goldhaft, and Peter Cohon (later, Coyote), broke away to experiment with the application of theatrical techniques to the process of changing people's consciousness on a massive scale. Instead of presenting plays on a stage, which audiences could regard as fictions separate from the realities of everyday life, the Diggers proclaimed themselves "life-actors."

They practiced a theater of the streets in which there was to be no dividing line between the audience and the actors, and in which participants could experience, at firsthand, a utopian world in which goods changed hands without money and in which life-actors followed their own deepest impulses, and not a script written and directed by others. The Diggers regarded the hippies of the Haight-Ashbury district as a population who lacked only the Diggers' dynamic example in order to become the crest of a rising wave of liberated individual consciousness, which would gradually engulf all members of "straight" (unliberated, nonhippie) society.

Anarchist hippies, however, were a minority in the counterculture. More numerous were those who attempted to achieve the liberation of human consciousness through the disciplined practice of mysticism: the conviction that religious faith requires not only belief in God, but also the direct experience of complete union with the Godhead, achieved through a process of mental discipline. Mystical hippies sought to reverse what they regarded as the spiritual death encouraged by scientific rationalism. They cultivated a seemingly limitless variety of religious beliefs in their efforts to counteract advanced industrial civilization's loss of faith in the spiritual and the metaphysical.

For some mystical hippies, the search for complete union with the Infinite took the form of a commitment to an established religious tradition or collective, such as Krishna Consciousness, the monastic forms of Buddhism, or the youth-oriented Christianity of the Jesus People. Frequently, however, mystical hippies followed spiritual teachers who advocated a syncretic philosophy, borrowing and combining concepts from diverse religious traditions, old and new. In addition, countercultural mystics sometimes pursued union with the Infinite through use of the powerful mind-altering drugs, especially LSD.

As students of the counterculture, we must not discount (as some authorities did at the time, and as some still do today) the seriousness of purpose with which countercultural youth sometimes approached the use of such drugs. At the same time, we must also realize that the risks inherent in LSD use were not then fully understood. Even those who approached its use with great reverence and respect for its mind-altering power sometimes suffered disabling psychotic reactions, occasionally leading to suicide. Such outcomes were more likely among those who used the drug not for religious purposes but simply for the thrill of the experience.

Through their pursuit of direct connection with the Godhead, mystical hippies sought, as did the anarchist Diggers, to transform the consciousness of all human beings. Widespread spiritual enlightenment would, they believed, lead to the withering away of institutions and practices that promoted human alienation. In their place would arise new forms of community and society promoting the sacredness of human life and the natural environment, and empha-

sizing the spiritual dimension of life over pursuit of material possessions.

ORIGINS

Although participants in the counterculture often sincerely believed that they had created the forms of countercultural radicalism from whole cloth, historical analysis shows that their originality lay less in their creation of new cultural forms and more in their capacity to combine existing cultural forms in new and imaginative ways. According to historian Laurence Veysey, the division of the counterculture into anarchistic and mystical schools of thought followed a pattern evident, since the nineteenth century, in the American tradition of cultural radicalism. A brief examination of two major influences on the counterculture reveals the debt that its proponents owed to earlier generations.

Historian Timothy Miller has carefully traced some elements of hippie communalism to the Catholic Worker movement and the School for Living, both of which originated during the era of the Great Depression. The Beats, a movement of literary experimentation and social criticism during the 1950s, provided another link between the hippies of the 1960s and older forms of American bohemianism. Few in number compared to the counterculture, the Beats nevertheless bequeathed to hippies their oppositional stance toward mass culture and conventional morality; an admiration of, and identification with, the marginalized people who lived by their wits "on the street"; a rich vocabulary of slang that they had appropriated from African-American jazz musicians; and a fascination with Asian mysticism. From both the Beats and the avant-garde artists of the 1950s working in other media, hippies inherited the belief that inspired art could serve as a vehicle for discovering the repressed elements of the self, revealing heretofore unimagined possibilities for human relationships through the transgression of conventional limits and the questioning of conventional wisdom.

DEVELOPMENT

The first countercultural enclaves took shape in 1965, mostly in urban settings and in college towns. Each enclave developed according to its own timetable and cultivated a distinctive local character. The most renowned of the early enclaves was the Haight-Ashbury district of San Francisco. The Haight was home to many students and faculty members of San Francisco State College; and, after authorities forced the Beats out of the North Beach district in 1962, many migrated there in search of inexpensive accommodations. New coffeehouses sprang up; soon, new rock and roll bands appeared, such as the Grateful Dead and the Jefferson Airplane, which played the "acid rock" influenced by Ken Kesey's experiments with electronics and light shows as accoutrements enhancing the effects of LSD. "Head shops," offering drug paraphernalia, books on Asian philosophy, and whimsical handicrafts, began to occupy long-vacant storefronts.

By late 1966, a "New Community" had taken shape, with its own psychedelic newspaper, the *San Francisco Oracle*, setting forth a vision of social change through mystical practice, and a rival faction, the Diggers, urging residents of "Psychedelphia" to become "life-actors," and realize *today* their vision of a new society through immediate, concrete activity.

The rapid growth of the enclave caused considerable tension between hippies and long-time residents. Meanwhile, the national media sensationalized developments in the Haight, portraying it, alternately, as a paradise of love and idealism in a heartless, competitive society, or as a sinkhole of moral depravity, addiction, and violence. A tidal wave of youthful seekers descended on the neighborhood during the spring and summer of 1967, far exceeding the number that could have been successfully integrated into the community. Many established hip bohemians, including most of the Diggers, left the neighborhood in search of less crowded environs, to escape the rapid rent increases that followed on the neighborhood's popularity and to escape the escalating violence of the drug trade, which organized crime had rationalized and commercialized.

A belief in a coming apocalypse—that straight society was an environmentally unsustainable way of life and one suffering a crisis of legitimacy in the face of rising popular discontent—pervaded both the counterculture and the New Left by 1968. Some New Leftists responded to this expectation of impending apocalypse by aligning themselves—at least, rhetorically—with Third World, anti-imperialist movements abroad, and militant, antiracist movements at home. Law enforcement agencies responded with increased efforts to infiltrate, destabilize, and destroy movement organizations. Many hippies responded to the expected apocalypse by leaving the cities to establish rural communes, in which they hoped to create new lifeways that would flourish in the free social spaces of postapocalyptic America.

The Rural Diaspora

Counterculturalists founded thousands of communes from 1968 to 1975. Writing separately, Timothy Miller and sociologist Judson Jerome converge on a rough estimate that perhaps as many as 30,000 rural and urban communes existed in the early 1970s, with a population approaching a million persons. By any estimate, the 1960s and 1970s witnessed the greatest surge in communal experimentation in the history of the United States.

These communes varied tremendously in terms of their social organization, longevity, and population size. Although many communal groups of a dozen or so kindred spirits formed, and then vanished, during the course of a summer, leaving no trace of their existence, other communes proved remarkably resilient. Several of the best-known hippie communes overcame the long odds against longevity and still exist today, even if in much-altered form, including Twin Oaks, in Louisa, Virginia; The Farm, in Summertown, Tennessee; and Black Bear Ranch, in Siskyou County, California.

Longevity should not be misinterpreted as a measure of a commune's "success." As historian Donald E. Pitzer has persuasively argued, the communal sharing of resources usually constitutes only one stage of a social movement's life cycle, and if prolonged beyond the point of its usefulness, communalism can become a barrier to a movement's continued development. Longevity *does* indicate, however, hip communards' devotion to their chosen way of life, long after the time when the wave of commune foundings crested in the early 1970s.

Both hippie anarchists and hippie mystics founded communes. What sustained these new communities, and what was everyday life like within them?

The Social Relations of Countercultural Communities

Communards traded the security of steady income in the mainstream economy for the expected social warmth of collective life. Since cash was usually scarce, its conservation was essential to the survival of the commune. Furthermore, the countercultural critique of consumerism made a virtue of the simple life. Freed from the time constraints of regular jobs, many hippie communards found both pleasure and profit in the manual labor of raising and preserving food; repairing vehicles, clothing, and shelters; and scavenging building materials, auto parts, used clothing, and sundry household items from the enormous stream of waste created by the consumer economy. Support from federal and local welfare programs also figured into the bottom line of many communes (although some, like The Farm, refused all such aid on principle).

Land ownership frequently proved a vexing question for idealistic commune-dwellers. The anarchist influence on countercultural thinking questioned the ethics of individual land ownership, arguing that land was a resource that belonged to all. At times, this ethic led to the declaration of "open land," upon which anyone might erect a dwelling and claim membership in the community. Lou Gottlieb, the legal owner of one of the earliest open-land communes, Morning Star Ranch, attempted to divest himself of mastery over the land by deeding it to God—local authorities having found his property in violation of numerous zoning regulations. More often, however, communalists accommodated themselves to the realities of land tenure, renting farmsteads or large urban houses, or benefiting from the donation of property to the group by a member or outside benefactor. Just as surely as the gift of land (or successful completion of mortgage payments) could lend long-term stability and a sense of rootedness to a commune, the loss of land could mean the demise of the community when landlords or benefactors experienced a change of heart.

In addition to the economies of scale that communal living provided, and in addition to the savings realized through simple living, some hippie communes, urban and rural, identified niches in the commercial economy that they were uniquely suited to fill. One of the more successful practitioners of this variety of hip capitalism was the Twin Oaks commune, which developed a successful hammock-making business. Other communes proved less fortunate: The Farm, for example, invested heavily in an expansion of its commercial agricultural production in 1978, at precisely the time when commodity prices plummeted. Losses from this reversal, in addition to a host of other pressures, finally forced a reorganization of the commune in 1981.

Anarchist communards, like those who occupied Black Bear Ranch from 1968 to 1974, resisted all efforts to stabilize governance by resort to formal political hierarchy. Nevertheless, some communes developed sophisticated systems of governance and accounting, such as Twin Oaks' work-credits system. The mystically inclined hippies of The Farm developed a complex corporate and political hierarchy as their ranks swelled in the late 1970s. By the end of that decade, it had become the largest of all countercultural com-

munes, with a population of perhaps 1,500 and with members branching out to found satellite communes in dozens of other locations.

Most communes fell in between the extremes of anarchistic decentralization and large-scale bureaucratization. The organizational structure of the Johnson's Pastures commune in Guilford, Vermont, took a variety of forms over time, as a high rate of membership turnover left the property in the hands of successive groups of relative newcomers. Further adding to the commune's difficulties was a struggle for control of the property between the tightly disciplined followers of a charismatic spiritual leader and the freewheeling successors to the original communards.

Day-to-day governance in most hip communities generally proved to be a matter of face-to-face interactions, rather than the sophisticated coalition-building and calculated organization of an institutional power base that characterizes the life of bureaucratic institutions. Among the Diggers, many (but not all) of whom lived in communal houses in San Francisco, the group's direction was left to the initiative of individual members, who derived influence from their perceived "personal heaviness"—that is, their demonstrations of fidelity to the group's anarchistic ideals, ability to conceive of new group projects that were both ideologically and aesthetically compelling (they were, after all, skilled practitioners of the theater arts), and the articulateness with which they justified their actions. Later, many communal groups sought to reach decisions through the development of consensus—sometimes through the application of "encounter-group" techniques and sometimes through interminable meetings, in which a single obstinate member could thwart the process. Perhaps the single most frequent form of communal governance was the exertion of peer pressure, whether manifested in the negative, as the threat of ostracism, or in the positive, as a live-and-let-live attitude that regarded efforts to impose one's own views as contrary to the spirit of the community.

Although most scholars have focused on the governance of individual communes, Barry Laffan argued that the Johnson's Pasture community occupied a specific niche within a larger network of increasingly more specialized movement organizations in southern Vermont and western Massachusetts in the early and mid-1970s. In terms of recruitment, Laffan located Johnson's Pastures within a national circuit of places known, by word of mouth, to be hospitable to itinerant members of the counterculture. Simultaneously, the recruitment of members depended not only on the personal contacts of existing members, but, as the local counterculture grew more specialized and institutionalized in the mid-1970s, on the commune's reputation as a haven for "street hippies," drawing misfits who did not feel at home in other local groups. In short, over time Johnson's Pastures became a low-status commune in an increasingly status-driven regional network.

The entire range of human reactions to life in close quarters, from the most admirable to the most despicable, found its expression in the hippie communes. At their best, the communes fostered a sense of community and intimacy that was rare—and, indeed, continues to prove sorely lacking—in the atomistic modern world.

Class, Race, and Ethnicity

As the example of Johnson's Pastures suggests, the counterculture brought together youthful seekers from a range of class backgrounds. Among many residents of the Haight-Ashbury enclave, the Hell's Angels motorcycle gang enjoyed a reputation as outlaws willing to defend their autonomy from the depredations of corrupt "Establishment" authorities, including the police. For a time, several of the Diggers (whose members came from both white-collar and blue-collar families) maintained an alliance with the biker "heavies," and one of their number, Bill Fritsch, actually joined the Angels.

As the mass media of the time frequently remarked, many other members of the counterculture came from middle-class, and even wealthy, backgrounds. If the power of the counterculture resided more in the attractiveness of its ideas than in the strength of its numbers, then one reason was because it drew on the articulateness of both middle-class, university-educated youth and the insights of cultural radicals from decidedly less privileged backgrounds.

Several commentators have noted the prominence of youth of Jewish heritage in the countercultural population, which necessarily paralleled their prominence in the movement as a whole—for example, among white students who "went South" to participate in Freedom Summer in 1964. A significant number of residents at both Black Bear Ranch and The Farm hailed from Jewish families, as did, for example, several of the leading figures on the staff of the Haight-Ashbury's first psychedelic newspaper, the *San Francisco Oracle.*

One factor that brought so many of Jewish heritage into the counterculture was the prominence of many of their parents in the radical politics of the De-

pression era. In many cases, this created a family tradition of strong commitment to social justice. The counterculture, as one segment of the youth revolt of the 1960s, thus can be understood only partially as a revolt of "youth" against parental authority. Although many youthful radicals, including many hippies, did quarrel with their parents over the appropriateness of their chosen form of rebellion, this did not always lead to total and permanent estrangement. For example, the correspondence that passed between members of the Black Bear Ranch commune and their parents demonstrates that, in many instances, sharp conflicts were but one dimension of a larger and enduring intimacy.

If the counterculture was perhaps more diverse in terms of social class than once was thought, it remains quite evident that hippiedom held significantly less allure for people of color than for white Americans. Many participants at the time, and many scholars since, have attributed this phenomenon to hippies' embrace of voluntary poverty, a stance available only to the economically privileged. Hippies, so this reasoning goes, had renounced the material possessions that impoverished minorities had never been able to enjoy.

Yet, this analysis presumes that the material acquisitiveness of the predominantly white middle class of the time constituted the universal standard of human dignity—a presumption that, once articulated, clearly stands open to debate. This analysis also obscures the existence of distinct forms of cultural radicalism among people of color during the 1960s and 1970s. Although the political nationalism of groups such as the Black Panthers has received more scholarly attention than the contemporary movements of African-American and Latino cultural radicalism, we will better understand the historical context of the counterculture by placing it in the context of the diverse manifestations of cultural radicalism of a multicultural society.

Gender

The counterculture took shape during the years immediately prior to the advent of the women's liberation and gay liberation movements. Like nearly all people at the time, hippies simply presumed that what we today call gender—masculinity and femininity—derived directly from biological maleness and femaleness, even if society molded those raw characteristics into "sex roles" that reflected its particular values at a given point in history. Although the popular memory is of hippie men as "longhairs" relatively indifferent to the prescribed masculine "sex role" embodied by John Wayne, the counterculture regarded the recovery of "natural" masculinity and femininity as integral to its program of liberation. All hippies agreed that conventional sex roles were repressive, and they believed that the liberation of the consciousness of the individual would facilitate the regeneration of authentic manhood and womanhood.

Counterculturalists disagreed sharply among themselves, however, over the appropriate means and ends toward that goal. Hippies' ideals and practices regarding the recovery of authentic masculinity and femininity depended primarily on their commitments to anarchist or mystical forms of social change. Hip anarchists suspected conventional forms, such as monogamous marriage, the nuclear family, and private property, as the primary means by which modern society robbed individuals of their autonomy. Thus, their gender ideal celebrated the manliness and womanliness of the "outlaw" who disregarded conventional morality. They championed the sexual revolution as not only an end to unwarranted restraint on individual sexual choice, but also as a vehicle for a more general liberation from all forms of unjust authority.

Hippie mystics thought of freedom not so much as the absence of rules, but as the recovery of awareness of the laws of nature from the hubris of an advanced industrial society beguiled by scientific rationality. Through mystical practice, they sought to reconnect men and women to the metaphysical dimensions of self and cosmos, including the transcended forms of masculine and feminine "energy" often conceptualized as yang and yin. Some mystics supported the practices of the "sexual revolution" as a means of ecstatic union with the Infinite. Others, like the followers of Stephen Gaskin at The Farm, saw the sexual revolution as another instance of modern society's lack of appreciation for the power of women's fertility and maternal nurture. Gaskin advocated that men adopt a chivalrous, "knightly" reverence toward "ladies," expressed in a willingness to commit to lifelong monogamous marriage. Other mystics, such as practitioners of Krishna Consciousness, distrusted the body and sensual indulgence as distractions from the discipline necessary to achieve union with the Infinite. They advocated total sexual abstinence as the ideal.

When the women's liberation movement (and, for a time, elements of the gay liberation movement) articulated an analysis of gender as a political and social, rather than reflexively biological, phenomenon,

they called into question the dominant countercultural assumption that freewheeling sexual expression would return relations between women and men to their presumptively harmonious, "natural" state. Although some men and women in the counterculture (including, for example, a minority of the residents of Black Bear Ranch) embraced this analysis, and some vehemently rejected it, many more responded more selectively, adopting some insights and practices and discarding others.

At Black Bear, most men moved toward a more equal distribution of household labor after women residents began meeting as a group to discuss the inequities of the commune's sexual division of labor in 1971. It took much longer, however, for some Black Bear women to gain the necessary skills to participate fully in tasks, such as woodcutting, once regarded as men's work. Similarly, the radical-feminist analysis of sexuality as a political process prompted a few of the women residents of Black Bear to create a "women's house" and to experiment, tentatively, with lesbianism as a form of sisterly solidarity. But in the main, most women residents appear not to have found this alternative compelling.

Thus, although the counterculture quite justifiably drew some of radical feminists' and gay liberationists' strongest criticism, and although elements of the counterculture offered resolute resistance to that criticism, preliminary evidence indicates that many more hippies proved at least moderately willing to adapt to that criticism as part of their commitment to social change through the transformation of individual consciousness.

The Fading of the Apocalypse

The great wave of commune foundings crested in the early 1970s. At various points in time after 1968, however, members of the movement reassessed the earlier expectation of an imminent, apocalyptic collapse of straight society that would facilitate rapid social change. As sociologists Jack Whalen and Richard Flacks have shown, this reassessment often did not amount to activists' recantation of their radical beliefs. Rather, it entailed a modification of the timetable for social change. Increasingly, New Leftists and hippies now expected change to come slowly, over a period of generations.

In light of this reassessment, it made sense to seek a more stable livelihood, one that would sustain their activism over an entire lifetime. Some left the communes to resume interrupted education toward conventional careers, such as law, that might be utilized as a means of social advocacy. Others sought to establish unconventional careers, such as the practice of "alternative" medicine, that bore the strong imprint of the counterculture's efforts to infuse daily life with religious ecstasy.

Of course, not everyone left the communes that had become so important as an expression of the countercultural quest for liberation. Those who carried on the communal lifeway sought to strengthen the economic foundations and governance mechanisms of their communities so that they might serve as vehicles for the invention and preservation of alternatives that might find a wider acceptance in future generations.

Thus, although the counterculture might not prove as visible today as it was in its heyday, its influence has diffused into the larger society through the large numbers of ex-participants who, in innumerable ways, still seek to spread peace and justice through the transformation of individual consciousness—if sometimes by less flamboyant means than they did in their youth. And though less visible today than in decades past, the many communes and "alternative" practices that still thrive on the margins of American society also bear witness to the power and vitality of the countercultural critique of American society.

American Buddhism

American Buddhism has undergone four developmental phases, evolving from a topic of intrigue and exoticism in the travel narratives "Oriental Tales" and critical missionary accounts of the early national period, to a religion imported and practiced predominantly by Asian immigrants during the nineteenth century, to a central component of an eclectic and trendy counterculture spirituality, and, finally, to a revered spiritual discipline for both Asian immigrants and American-born converts during the last four decades of the twentieth century. Including practitioners of the three major forms of Buddhism—Theravada (predominant in Southeast Asia), Mahayana (predominant in China, Korea, and Japan), and Vajrayana (predominant in Tibet and Mongolia)—American Buddhism is the result of a social movement forged by Asian immigrants and teachers, American converts, and sympathizers who found wisdom in the Dharma (the teachings of Buddhism's founder, Siddhartha Gautama, 563–483 B.C.E.). The history of Buddhism in America is as complex as the immigrant cultures and teachers who transplanted it and as diverse as the individuals who practice it. Yet four categories of analysis—orientation, encounters, exclusion, and passages—laid out by Thomas A. Tweed and Stephen Prothero in *Asian Religions in America: A Documentary History* (1999) provide the most compelling framework for understanding the forging of a uniquely American Buddhism.

Orientation 1784–1840

Americans, whose attention initially turned eastward with the intention of capturing lucrative Asian markets, have long been fascinated by the contrasts in worldviews and religious beliefs between the peoples of the East and the West. Americans, however, drew their first impressions of Asian cultures and religions from reading the culturally biased travel narratives of traders, encountering artifacts brought back from China, and perusing reports by missionaries who labeled Buddhists as spiritual degenerates and atheistic heathens. In addition, the popular, fictional work "Oriental Tales" of this period whose authors sought to portray the exoticism of Asian cultures, such as Benjamin Franklin's "A Letter from China," further informed Americans' opinions about Buddhism. As a result, Americans lacked a learned understanding of Buddhist traditions and beliefs. Hannah Adams's *A Dictionary of Asian Religions* (1817) constituted the most sophisticated treatment of Buddhism by an American writer of the period. Adams, in an effort to understand Asian religions without comparing them to Christianity, argued that Buddhism was a venerable spiritual discipline practiced by one-third of the world's population.

Encounters 1840–1924

Americans gained direct access to Buddhist teachings after 1840 when publications such as *The Dial*, the voice of Transcendentalists and advocates of religious liberalism, published translations of Buddhist texts, including portions of the *Lotus Sutra*. Influenced by *The Dial*'s translations of "Ethnical Scriptures," popular American writers such as Ralph Waldo Emerson, Henry David Thoreau, and Walt Whitman included references to Buddhist traditions in their writings.

Anglo converts to Buddhism, however, were rare. By far the most important transmitters of Buddhist tradition to America during this time period were the Asian immigrants who transplanted their ethnic religions in the West Coast's booming cities. Between 1850 and 1924, 368,000 Chinese immigrants and 270,000 Japanese immigrants entered the United States. Chinese merchant societies set aside space for worship on the upper floors of their properties, and immigrants established makeshift "joss houses" (God houses) in which they practiced Chinese folk religions that blended elements of Confucianism, Taoism, and Buddhism. San Francisco's Chinatown had at least eight temples by 1875, and historian Ferenc Szasz estimates

that Chinese immigrants had established 400 temples on the West Coast by 1900. Japanese Buddhists, led by Dr. Shuye Sonoda and Reverend Kakuryo Nishijima, teachers of the True Pure Land Buddhism, established the Buddhist Mission to North America (BMNA) in 1898. In an effort to demonstrate their Americanism during World War II, a time of persecution and hardship for Japanese Americans interned in prison camps, the leaders of the BMNA renamed their institution the Buddhist Churches of America.

Zen, the most influential form of Japanese Buddhism in America, was introduced at the 1893 World's Parliament of Religions: a seventeen-day conference of 200 international delegates, organized by American religious liberals, and held in Chicago in conjunction with the Columbian Exposition. Historians define the Parliament of Religions as a decisive event in the history of American religious pluralism. Indeed, the meeting marked the beginning of a Buddhism that reached beyond Asian immigrant communities and sparked a dialogue between Buddhist teachers and potential American converts. Contacts crucial to the growth of Buddhist institutions in America were forged at the meeting. Paul Carus, for instance, the most important Buddhist sympathizer of the Gilded Age and the director of Open Court Publishing Company, met Japanese Zen master Soyen Shaku and Anagarika Dharmapala, the Theravada Buddhist delegate from Ceylon.

The ties forged at the conference marked a turning point in American Buddhism. Shaku's student D.T. Suzuki moved to the United States, where he worked with Carus for ten years, translating the Buddhist texts published by Open Court. Dharmapala traveled across America lecturing at events set up by Carus, and Carus himself wrote more than sixty books following the conference. Carus, intending to popularize Buddhism in America, borrowed from the philosophies of Dharmapala and Suzuki to create a marketable American Buddhism. Dharmapala, in a speech titled "The World's Debt to Buddha," had already explained to an American audience the pragmatism of Buddhist thought and practice: "In the religion of Buddha are found a comprehensive system of ethics and a transcendental metaphysic embracing a sublime psychology. To the simpleminded it offers a code of morality, to the earnest student a system of pure thought. But the basic doctrine is the self-purification of man." Carus repeatedly employed Dharmapala's logic to argue that Buddhist doctrines fit well in a modern America characterized by progress, reason, and scientific expertise.

EXCLUSION 1924–1965

Although the 1893 World's Parliament of Religions pointed to a future of religious pluralism and transnational spiritual dialogue, it took place amidst a general atmosphere of intolerance toward Asian immigrants. Workers in the West who feared competition from Chinese laborers in mining, agriculture, transportation, construction, and small business, and middle-class reformers who believed there were ineradicable racial and cultural differences between Asians and whites had convinced Congress to pass the Chinese Exclusion Act in 1882, effectively stemming Chinese immigration and excluding Chinese from U.S. citizenship. American policymakers targeted Japanese immigration with the 1907 Gentleman's Agreement. Discriminatory immigration restriction based on national origins culminated in the First and Second Quota Acts of 1921 and 1924, respectively, which established quotas of fewer than 100 for both China and Japan.

As a result of federal legislation, the Asian immigrant populations in America stagnated, as did ethnic Buddhist organizations. By 1906, the Census Bureau counted only 62 Chinese temples and 141 shrines in twelve states. Yet Asian-born leaders, such as D.T. Suzuki, expanded the reach of American Buddhism by converting Anglo Americans. Asian leaders opened Zen centers in Los Angeles, San Francisco, Chicago, and New York, published books, and delivered lectures on the East and West coasts. D.T. Suzuki, the most well known and influential Buddhist teacher of this period, contributed to the fashionable "Zen boom" among American elites during the 1950s. He taught at Claremont Graduate School and Columbia University, helped establish the Cambridge Buddhist Association in Massachusetts, appeared on television, and was the subject of at least nine articles in the popular press. Suzuki's lectures and books appealed to a diverse group of American writers and thinkers, including Alan Watts, J.D. Salinger, Jack Kerouac, Allen Ginsberg, Gary Snyder, Trappist contemplative writer Thomas Merton, neo-Freudian psychologists Erich Fromm and Karen Horney, and the humanist psychologist Abraham Maslow.

PASSAGES 1965–Present

Intellectuals Frederick Spiegelberg and Alan Watts, American converts such as Gary Snyder, Beat writers Jack Kerouac and Allen Ginsberg, and Asian teachers Shunryu Suzuki and Chogyam Trungpa did much to popularize Buddhism as a viable spiritual alternative

in postwar American society. In fact, this diverse group ensured Buddhism's inclusion in the spiritual experimentation of the 1960s counterculture and the holistic approach of the human potential movement during the 1970s. In 1951, Frederick Spiegelberg, a Stanford professor of comparative religions, became the director of the American Academy of Asian Studies in San Francisco and invited the former Episcopalian priest and popularizer of Zen Buddhism Alan Watts to join the faculty. Under Spiegelberg's and Watts's leadership, the academy formed the center of the San Francisco Renaissance in the 1950s and 1960s, providing a welcoming intellectual and cultural space where the adventurous soul could explore his or her consciousness through such diverse vehicles as Asian religion, humanist psychology, experimental poetics, and popular drugs.

Jack Kerouac, the most famous of the Beat writers, attended lectures at the academy. In *The Dharma Bums* (1958), he captured the spontaneous experimentation that characterized the San Francisco scene in the 1950s and expressed the hope that Zen Buddhist practice might form the basis of a new spirituality in America society. Japhy Ryder, the central character whom Kerouac based on Zen practitioner Gary Snyder, exclaims:

> I see a vision of a great rucksack revolution thousands or even millions of young Americans wandering around with rucksacks, going up to mountains to pray . . . all of 'em Zen Lunatics who go about writing poems that happen to appear in their heads for no reason. . . . What we need is a floating zendo. . . . Yessir, that's what, a series of monasteries for fellows to go and monastate and meditate in, we can have groups of shacks up in the Sierras or the High Cascades or even Ray says down in Mexico and have big wild gangs of pure holy men getting together to drink and talk and pray.

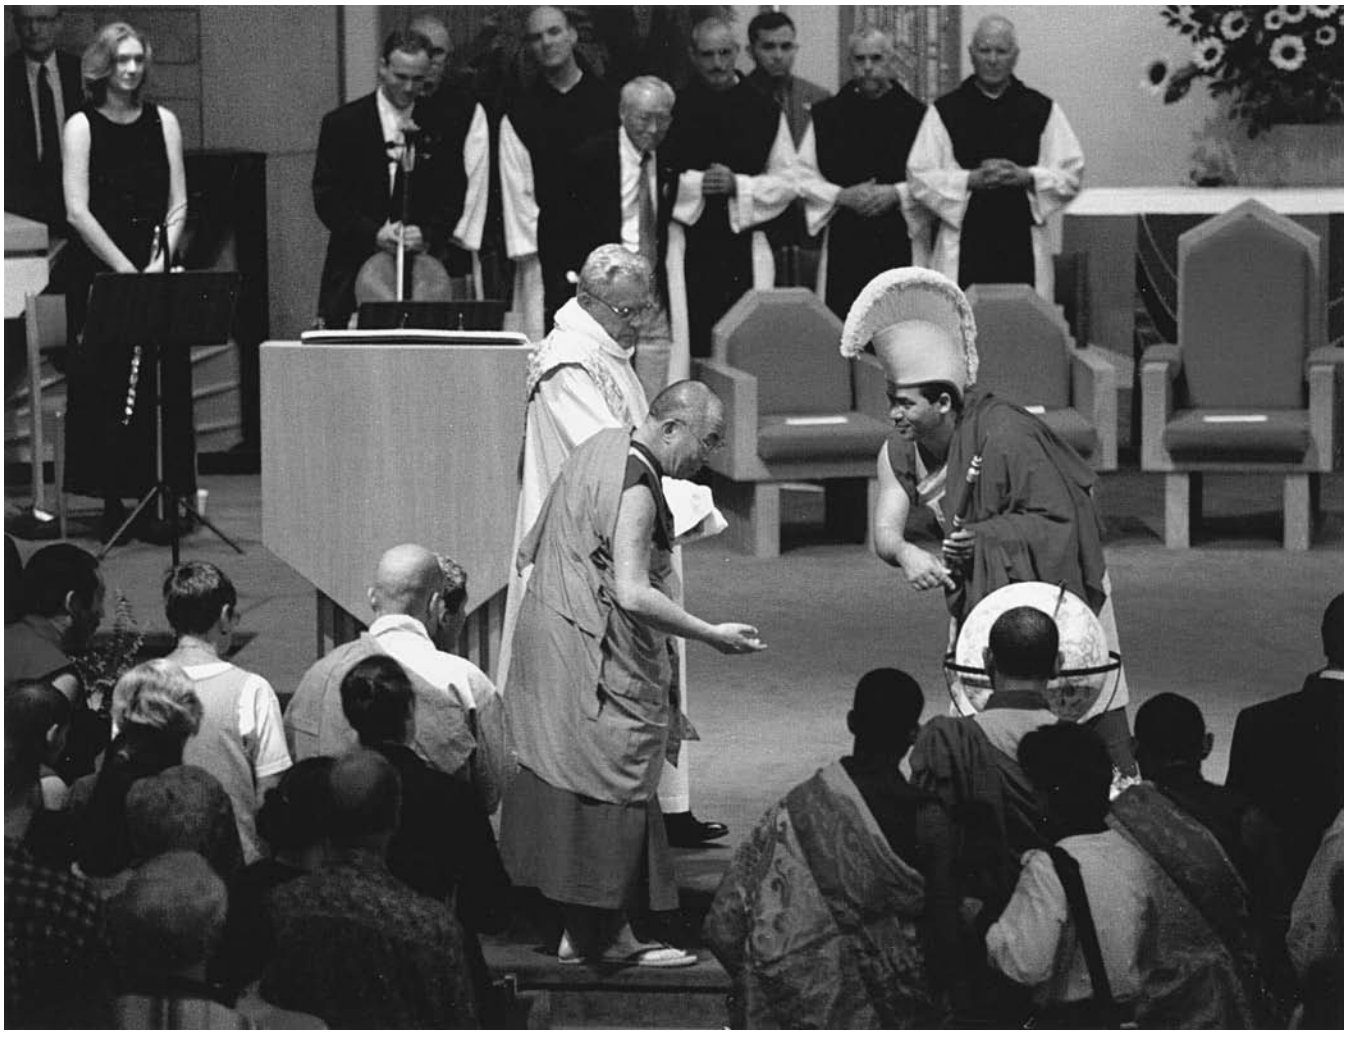
The teachings of Watts and Spiegelberg at the American Academy of Asian Studies and the popularization of Zen by Beat authors created a demand among Anglo Americans for instruction in Zen practice, prompting Shunryu Suzuki (1905–1971) to found the San Francisco Zen Center in 1962. With the founding of the San Francisco Zen Center, Tassajara Zen Mountain Center, and Green Gulch Farm in Marin County, California, American Buddhism became an institutional reality, offering American converts an unprecedented opportunity for advanced Zen training and a monastic regimen in the United States.

The institutionalization and popularization of American Buddhism escalated after 1965, when Congress passed the Hart-Cellar Act, abolishing the restrictive national origins quota system. Asian teachers, including Tibetan meditation master Chogyam Trungpa, immigrated to the United States. From his base of operations in the hip city of Boulder, Colorado, Trungpa did more than anyone else to shape the nature of Tibetan Buddhism in the United States, propelling the least known form of Buddhism before 1970 to one of the most popular in recent years. Aided by Beat poet Allen Ginsberg, Trungpa masterminded the establishment of the Buddhist-Poetics-Humanist Psychology community in Boulder, institutionalizing this hybrid counterculture spirituality into an experimental educational enterprise: the Jack Kerouac School of Disembodied Poetics (1974) and the Naropa Institute (1976), now Naropa University.

Trungpa had fled Tibet in 1959 after the Chinese government launched a campaign of ruthless oppression that eventually killed or drove into exile a third of the entire Tibetan population. After studying religion and mastering English at Oxford University, Trungpa established a meditation community in the Scottish Highlands. He felt at home in the mountains, but upon determining that "the Scots were slightly missing the point," Trungpa accepted an invitation to teach a religious studies course at the University of Colorado, moving his operation to Boulder in 1970.

Initially, Trungpa attracted students largely from the communes that surrounded Boulder. The new practitioners congregated at the Kharma Dzong meditation center, dropped acid, listened to Trungpa's lengthy lectures, and attempted to meditate on images from the *Tibetan Book of the Dead*. Trungpa and his student poet Allen Ginsberg concluded that, by combining the philosophy and practices of Tibetan Buddhism, the teachings of Humanistic Psychology, and the spontaneous poetic style of the Beats, they could fundamentally change the way students perceived the world.

Trungpa and Ginsberg became visible members of Boulder's growing counterculture community when they launched the Jack Kerouac School of Disembodied Poetics. Its first summer session offered courses and workshops in Eastern and Western disciplines of meditation, philosophy, psychology, poetry, creative writing, theater, dance, music, and visual arts. Prominent poets, artists, and scholars volunteered to teach that summer, including Allen Ginsberg, William S. Burroughs, Ann Waldman, Harvey Cox, Ram Dass, and Gary Snyder. Organizers of the school's first sum-



At St. Charles Borromeo Church in Bloomington, Indiana, a Buddhist monk greets the Dalai Lama on August 23, 1999. The Dalai Lama is the spiritual leader of Tibetan Buddhists, a branch of Buddhism that has attracted a large number of followers in the United States. *(AP Wide World Photos)*

mer session expected a maximum of 200 locals to participate in the workshop, but the prospect of enlightenment offered by Beat poets, hallucinogenic drugs, and Eastern religious gurus drew 2,000 people from across the nation.

Realizing the marketability of their alternative educational and spiritual experiment, Trungpa and Ginsberg founded Naropa Institute, a contemplative college that offered degrees in buddhist studies, Western psychology, and secular meditation. Instead of directing students toward a career path and a life of acquisitive materialism, Naropa would offer them a life of contemplation and service to the community. Required courses in Naropa's degree programs included spontaneous prose writing, history of the Beat poets, sensory awareness, body movement, transpersonal psychology, organic gardening, and insight meditation. In addition, Naropa's summer writing program continued to draw America's most famous radical poets and authors to Boulder. Beyond establishing Naropa Institute, Trungpa adapted traditional Tibetan teachings to American culture to meet the needs of his American students. In 1977, for instance, he developed Shambhala training, a secularized path to spiritual awakening based on meditation practice, and he established an international network of Shambhala Meditation Centers that together constitute the largest Tibetan organization in the Western Hemisphere.

The accretion of temples, universities, meditation

centers and retreats, publishing houses, and periodicals founded by Buddhist teachers and practitioners provided an institutional base for Buddhist Sanghas (communities) within America's diverse religious landscape, simultaneously popularizing aspects of Buddhist philosophy and spiritual practices to American consumers. In addition, American Buddhism continues to evolve as a social movement as "Engaged Buddhist" activists, inspired by world-renowned leaders like the Fourteenth Dalai Lama, Tibetan Tenzin Gyatso, and Vietnamese Zen Buddhist Thich Nhat Hanh, agitate for a politics that privileges environmentalism, social justice, world peace, and international human rights.

Antiwar/Protest Movements

Introduction

When most people think of the American antiwar movement, the images that come to mind usually include the Vietnam War, student radicals, mass marches in Washington and New York, and the burning of draft cards. But antimilitarism in the United States has a long history that transcends the events of the 1960s. With roots in Christian pacifism and secular movements of political opposition that date back to the earliest years of American history, antiwar movements have grown and evolved to include a diverse constituency with a variety of political and religious beliefs and a wide range of strategies and approaches. The contemporary American antiwar movement represents the result of centuries of development and struggle.

Before there was a "movement," there were simply antiwar sentiments—brought over to the American colonies by members of the historic peace churches (the Quakers, the Mennonites, and the Brethren) and fostered by a growing colonial aversion to the carnage of the European imperial wars. Through the first half of the nineteenth century, pacifism largely remained the domain of personal religious witness. Antiwar protests, on the other hand, against wars like the War of 1812 and the 1846 Mexican-American War, grew out of the secular political divisions of their times. Although the influence of these two strains of American antimilitarism, political and religious, has varied since then, this distinction between principled pacifism and pragmatic antimilitarism continue as a defining feature of American antiwar struggles.

So, too, did the link between peace and social justice. Early-nineteenth-century pacifist leaders made the initial connection between these two concerns by building strong alliances with other antebellum evangelical movements for social and political change. The most visible merging of these efforts can be seen in the "nonresistance" policies advocated by members of the radical abolitionist movement led by William Lloyd Garrison. After the Civil War, women's rights activists took on the antiwar cause as part of their broad "maternalist" political agenda that defined women's Progressive Era reform. Bohemians, Socialists, and other radicals linked antimilitarism to the struggle for working-class solidarity before and during World War I, and responded to the political repression during those wartime years by fighting to defend basic civil liberties and constitutional rights. The antiwar movement of the 1920s and 1930s similarly linked its goals to those of the surging labor movement, while pacifists from the 1940s through the 1960s made concrete connections between their nonviolent protests against war and the developing black freedom struggle. Struggles for peace and fights for social justice have often gone hand in hand.

In spite of these strong threads of continuity, the history of the American antiwar movement is just as strongly marked by change. Before 1915, there were antiwar efforts, pacifist groupings, and antiwar organizations, but no organized protest movement had arisen in a form that people would recognize today. Most pacifists of the pre–World War I era focused on pursuing a style of individual "nonresistance" through personal acts of religious witness and fidelity. Secular antimilitarists, on the other hand, generally saw themselves as constructive political actors, but not as leaders of social movements. In fact, many of these antiwar advocates saw their work as supporting the status quo of American politics rather than opposing it. Indeed, during the late nineteenth and early twentieth centuries, the most prominent American antiwar efforts were led not by pacifists or by dissidents, but by members of America's professional and business elite, who focused their attention on building institutional structures to mediate international conflict and promote global trade.

World War I changed everything. In response to

the carnage that defined the European conflict, a national, organized antiwar movement emerged in the United States for the very first time. This movement drew upon the initiative of Progressive reformers, women's suffragists, Socialists, pacifists, and radical activists and intellectuals. Its opposition to U.S. involvement in the war was both principled and pragmatic. But most significantly, the leaders of the World War I–era peace movement used the political skills and experiences they had gained in other struggles to create national political organizations capable of mobilizing vast numbers of people. In the years before the United States' 1917 entry into the war, they organized mass demonstrations for peace never before seen in this nation's history. Afterward, in the face of state repression and a national Red Scare, the number of antiwar advocates shrank but their efforts continued. In the process, activists created the framework for modern American antimilitarism: a mass-based movement standing in opposition to U.S. overseas policies and linked to progressive and radical struggles for social and political change.

The antiwar movement continued to evolve over the course of the twentieth century. Certainly, strategies changed. In the 1930s, for example, inspired by Mohandas Gandhi's organized resistance campaigns against British colonial rule in India, American activists began to incorporate the tactics of nonviolent direct action into their work for peace. Pacifist practice moved beyond the traditional doctrine of passive nonresistance—of simply refusing to fight—to include the more active Gandhian tactics of nonviolent resistance to war.

The political focus of antiwar efforts changed as well. The end of World War II forced pacifist and nonpacifist activists to turn their attention toward the threat of nuclear arms. Such efforts culminated in the massive "ban-the-bomb" movement of the late 1950s and early 1960s, which were then overshadowed by the increasingly militant and widespread opposition to the Vietnam War—the movement that most people think of when then they think of "the American peace movement." Although the mass base of the Vietnam War–era antiwar movement was unprecedented, it was built on the leadership and example of those activists who had come before to wage a far-reaching and persistent fight against U.S. Cold War policies. Activists in the decades since have used the experiences and lessons of the 1960s to continue the struggle against nuclear weapons, the American culture of violence, and U.S. military intervention overseas. The recent mass protests throughout the nation against the United States' unilateral war on Iraq represents simply the latest evolution of the movement's broad antiwar agenda.

As the essays in this section show, perhaps the most striking characteristic of the American antiwar movement is its longstanding diversity: in goals, in membership, and choice of political tactics. Over the course of its history, American antiwar efforts have embraced people from a variety of political and philosophical backgrounds—from absolute pacifists opposed to violence and war of any kind to individuals politically opposed to specific wars, to social and political reformers intent on finding constructive ways to promote peace. Members of these movements have spanned the political spectrum from right to left and have often linked the antiwar struggle to other campaigns for social change, including abolitionism, antipoverty crusades, and struggles for women's rights. This diversity of purpose has been a source of weakness and strength. At times, as during the 1930s and 1960s, this range and variety helped create a vital and broad-based movement with significant political impact. At other historical moments, these differences created deep divisions that undermined efforts to build and sustain political influence and support. At almost all times, antiwar efforts have been minority campaigns of dissent that operated from the margins of national politics and culture. Nevertheless, the antiwar movement has played an integral role in America's protest tradition, reflecting the nation's values and perspectives even as it has worked to challenge and reform the meanings of patriotism and loyalty in American life.

Marian B. Mollin

Antiwar Movement: Overview

Antiwar movements in the United States have historically embraced people from a variety of political and philosophical backgrounds—from absolute pacifists opposed to violence and war of any kind to individuals politically opposed to specific wars, to social and political reformers intent on finding constructive ways to promote peace. Members of these movements have spanned the political spectrum from right to left and have often been linked to other struggles for social change, including abolitionism, antipoverty crusades, and both early and contemporary struggles for women's rights. This diversity of purpose has been a source of both strength and weakness. At times, as during the 1930s and 1960s, this range and variety has helped to create a vital and broad-based movement with significant political impact. At other historical moments, these differences have created deep divisions that undermined efforts to build and sustain political influence and support. At almost all times, antiwar efforts have been minority campaigns of dissent that operated from margins of national politics and culture. Nevertheless, the antiwar movement has played an integral role in America's protest tradition, reflecting the nation's values and perspectives even as it worked to reshape and reform some of the most basic assumptions of American life.

Pacifism and Antimilitarism in Early America

Although the antiwar movement as we know it today did not emerge until the cataclysmic years of World War I, pacifism and antimilitarism have a long heritage in the history of American political dissent. Pacifism came to colonial America through the historic peace churches, the Religious Society of Friends (Quakers) and Anabaptist sects like the Mennonites and the Brethren, and until the twentieth century pacifism was primarily religious in orientation. Building on the Christian principles of loving one's enemy and turning the other cheek, religious pacifists adopted a stance of "nonresistance" by resolutely upholding the biblical injunction against killing. This position most obviously required refusing to bear arms or join the military. Nevertheless, it did not automatically imply engaging in active resistance to war. Instead, the traditional nonresistant pacifist was expected to submit to violence even as he or she refused to participate in it.

It is important to differentiate between principled pacifism and the more pragmatic political efforts individuals and groups have made to influence U.S. foreign policy and international affairs. In fact, when looking at the early history of American antimilitarism, one is struck by how little pacifism influenced antiwar efforts at all. According to historian Charles DeBenedetti, the Revolutionary struggle for independence, for example, arose in part as a response to a growing cultural revulsion to militarism. Antiwar sentiments grew out of the evangelical religious revivalism of the First Great Awakening and the intellectual currents of Enlightenment thought, and by the mid-1700s had begun to shape Americans' ideas about their involvement with the larger world. Colonists spoke out about wanting to break from the seemingly endless cycle of European wars and to protect themselves from the threat of tyranny posed by British soldiers on colonial soil. Even though Revolutionary War leaders embraced the need for armed resistance to British imperial power, many still described their ultimate goal, in the words of Thomas Paine, as "peace for ever." Those who opposed the Revolutionary struggle, on the other hand, largely opposed it for political, not antimilitarist, reasons. Loyalists supported the British Crown and believed that resistance to colonial rule would endanger the health of American society overall. But, like their patriot counterparts, they were more than willing to take up arms. Antimilitarist and antirevolutionary beliefs did not preclude waging war in battles for independence.

Religion and Pacifism

There was a Revolutionary War–era pacifist movement, but its emphasis was on religious constancy, not political protest. This was a difficult stance to uphold, even for members of the historic peace churches. Many did not necessarily oppose the war per se, but they overwhelmingly refused to fight, often at great risk to their personal well-being. A number lost property or faced physical persecution for their stance. Most simply tried to live their lives as best as they could according to their faith. For many, this meant turning inward into their religious communities and isolating themselves from the larger outside world. Others, like the Friends, chose to take on a more activist role by providing aid to noncombatants caught in the wake of war, and thus began a long tradition of Quaker social reform.

The distinctly nonpacifist nature of early American antiwar protest similarly characterized opposition to the War of 1812. Relations with England, never particularly good after the Revolutionary War, turned overtly hostile in the early 1800s as the repercussions of the Napoleonic War began to be felt on North American soil. But the decision to declare war on Britain reflected not only frustration with British policies, but also the increasingly partisan divisions that had come to characterize American political life. Thomas Jefferson's political heirs, the Democratic-Republicans, were among the most vocal war hawks of the time. They fondly recalled France's support of their own revolutionary movement a generation before, and they considered themselves ideological brothers to Napoleon's own revolutionary crusade. To declare war on France's enemy thus seemed logical and just. But to the Federalist opposition, mostly New England merchants who depended upon the trans-Atlantic trade and who had strong cultural and economic ties to England, the war was a tragic mistake. They feared that it would bring American commerce to a halt and create an irreparable schism between the United States and what Caleb Strong, governor of Massachusetts, emotionally referred to as "the nation from which we are descended." When President James Madison brought the declaration of war to Congress, not one New Englander voted in support.

Federalist opposition did not stop there. Antiwar sentiment was widespread, especially in the Federalist stronghold of New England, where it reached its peak in 1814. Resistance to the war took many forms, from the public speeches of prominent leaders who decried Anglo-American hostilities to the refusal of New England financiers to purchase war bonds, to public demonstrations among common people reminiscent of the Revolutionary War–era street actions that had undermined British colonial rule. The revolt of the Federalists and their sympathizers culminated in the Hartford Convention of 1814–1815, when Federalists gathered to complain of the federal government's disregard of New England's interests, discussed the possibility of seceding from the Union, and then crafted a public statement that elaborated their grievances about the war.

These acts of protest did little to impede the actual conduct of the war but led almost directly to the downfall of the Federalist Party. A victim of bad timing, the Hartford Convention's statement of dissent came out just as the war came to an end, with Andrew Jackson's symbolic but triumphant victory over the British at the Battle of New Orleans. Although the results of the war were ambivalent at best, nationalists couched the conflict as a second War of Independence and denounced the antiwar Federalists as traitors. With that, the Federalists' political fate was sealed. Their antiwar stance had cost them political influence and power. As a political party, they ceased to exist.

The Nineteenth-Century Peace Reform

Antiwar sentiments, on the other hand, persisted and spread over the course of the nineteenth century. War continued to be a touchstone for domestic political divisions, most notably in the case of the Mexican-American War. But the nature of peace advocacy also changed as the evangelically based antebellum reform movements gave birth to a nonsectarian strain of pacifism, distinct from that of the historic peace churches but similarly rooted in a principled opposition to violence of all kinds. By the late 1800s, the peace reform had evolved to yet another stage. Peace advocates, influenced by both Gilded Age and Progressive tendencies, embraced the goals of rationality, practicality, and an activist state over spiritual and moral reform. Their focus shifted as they worked to create institutions to prevent and mediate international conflict. Growing efforts to link the emerging struggle for women's rights to the antiwar cause augmented the movement's focus. Together, these ingredients laid the groundwork for the birth of a recognizably modern American peace movement.

The most dominant form of antebellum antimilitarism grew directly out of the religious revivalism of the early 1800s known as the Second Great Awaken-

ing. Newly inspired converts quickly translated their religious zeal into action as they organized Bible tract societies, temperance campaigns, antiprostitution crusades, and antislavery associations, seeking to address the social ills of nineteenth-century American life. This movement similarly inspired the men who founded the nation's first two peace organizations in 1815: the New York Peace Society and the Boston-based Massachusetts Peace Society. As David Low Dodge, founder of the fledgling New York society typically proclaimed, "All who love our Lord Jesus Christ in sincerity cannot but ardently desire that wars may cease." The pursuit of peace, he believed, not only would save Americans from the scourge of war, but would turn them away from the temptations of vice, bringing them ever closer to the kingdom of God. Mirroring the strategies of other evangelical reformers, antebellum peace advocates emphasized persuasion and conversion, and recruited volunteers to distribute literature and organize public lectures. Though small in number, they abided in the belief that they could convert society to their aims.

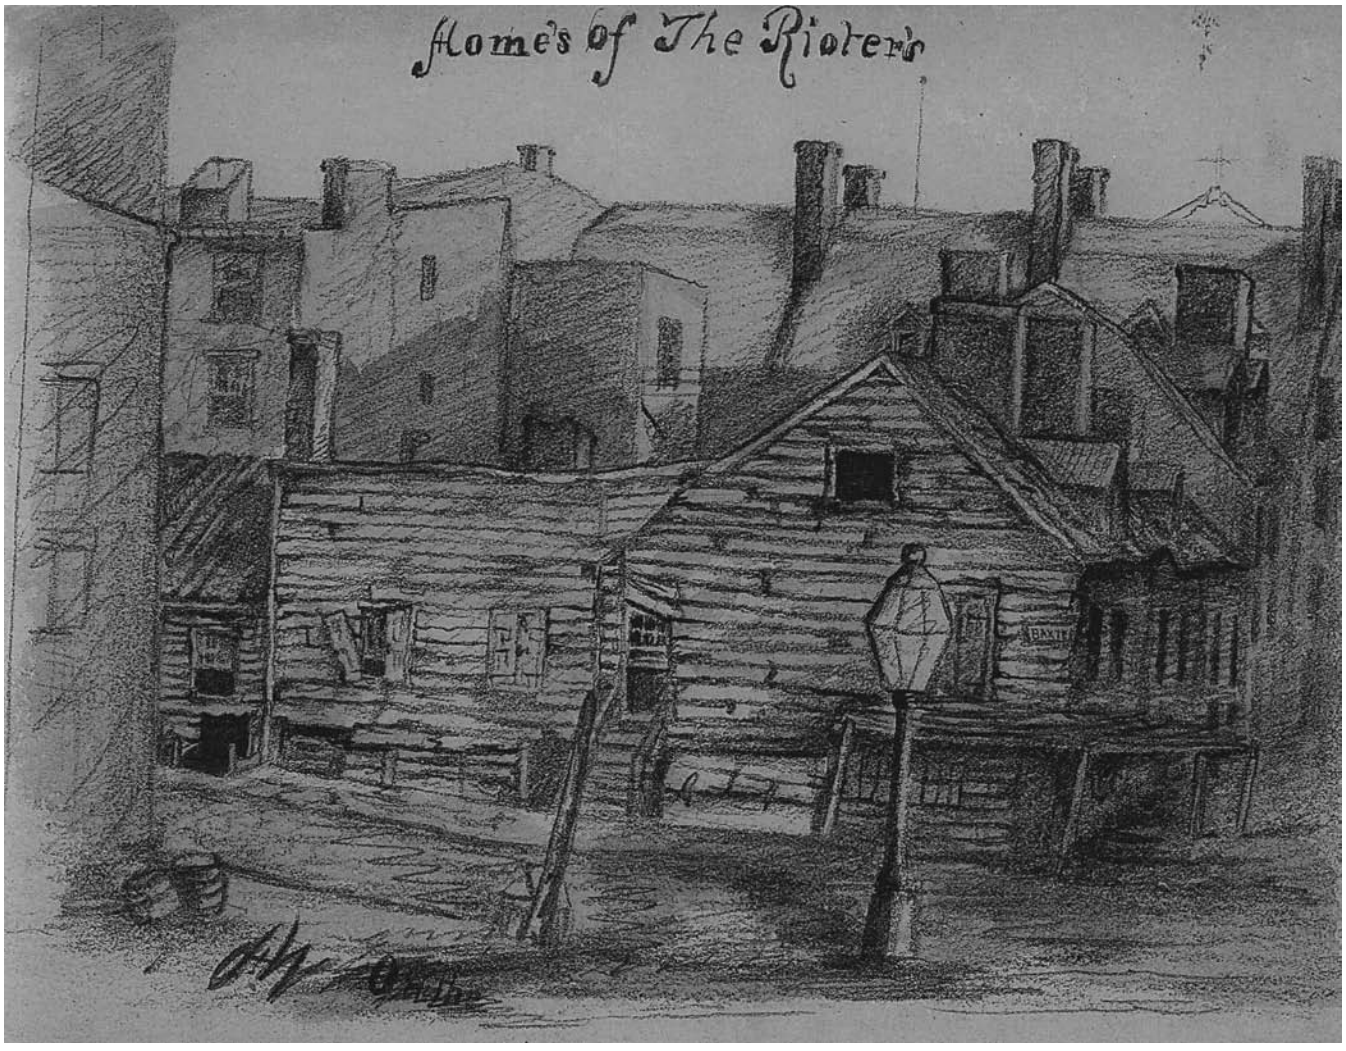
In the years leading up to the Civil War, peace reformers forged strong alliances with other movements for social and political change. By 1838, for example, with the founding of the New England Non-Resistance Society, it became almost impossible to separate advocates of Christian nonresistance from the radical wing of the antislavery movement led by the well-known abolitionist William Lloyd Garrison. In Garrison's eyes, slavery was a form of violent coercion as heinous as war that required personal purity, a commitment to nonviolence, and unceasing agitation to overcome. The Garrisonians' embrace of a more active form of pacifism distinguished them from others who sought to abolish slavery through either force or legislation, and helped link ideas about peace to the abolitionist cause. At the same time, this most "ultra" group of evangelical reformers also began to relate nonviolence and nonresistance to the organized pursuit of women's rights. The leaders of this movement, including early feminists like Elizabeth Cady Stanton, Lucretia Mott, and Sarah Grimké, saw nonresistance as a critical tool in overcoming the oppression faced by women as well as slaves.

Peace reformer Elihu Burritt provided antebellum Americans with another example of how nonviolence could be linked to larger struggles for justice and social change. Like Garrison, Burritt based his nonresistance on an understanding of Christian perfectionism that viewed war as what he called the "sin-breeding sin of sins" and that sanctified the notion of a brotherhood of man. This belief in brotherhood, and his background as a blacksmith, led Burritt to embrace a far more inclusive vision of peacemaking—one that inspired him to turn peace advocacy into a trans-Atlantic cause that could be embraced by the working as well as middle classes. In 1846, he traveled to England, where he promoted the idea of an international peace pledge and helped found the League of Universal Brotherhood, which quickly counted over 30,000 members in Britain and 25,000 in the United States. To attract working-class recruits, Burritt argued for peace on economic as well as moral grounds and publicly cast his lot with laboring men. In his eyes, the pursuit of nonviolence needed to be more than just a vocation for the elite: only an organized international working-class brotherhood could help pave the way for universal peace.

The outspoken nature of these antebellum peace leaders, however, belied the general apathy that most Americans felt toward the antiwar cause. Nevertheless, when war with Mexico broke out in 1846, opposition raged, especially in New England and the Old Northwest. For the most part, these clusters of antiwar sentiment stemmed not as much from a principled opposition to war as from pragmatic political concerns regarding the growing power of Southern slaveholding interests in national politics. Northerners overwhelmingly viewed the U.S. incursions into Mexico as part of a larger Southern plot for territorial expansion and believed that acquiring new territories would exacerbate the already tense divisions between the North and the South. Abraham Lincoln, then a young congressman from Illinois, publicly criticized President James Polk for instigating the conflict and lying to Congress. Newspaper editors denounced the conduct of the war. And writer Henry David Thoreau publicized the voice of moral protest and individual conscience when he refused to pay taxes to support what he believed to be an immoral war and then marched off to jail. His essay "On Civil Disobedience" became a powerful statement on the virtue of individual resistance to governmental wrongdoing. Yet, in the tradition of earlier antiwar advocates, Thoreau and others did not justify their position with pacifist ideals. In the 1840s, Christian nonresistance and antiwar agitation were not one and the same.

Pacifism and the Civil War

The increasing intensity of the national struggle over slavery in the 1850s further undermined the power of the peace reform movement. As the nation headed toward war, pacifist reformers stood on the edge of po-

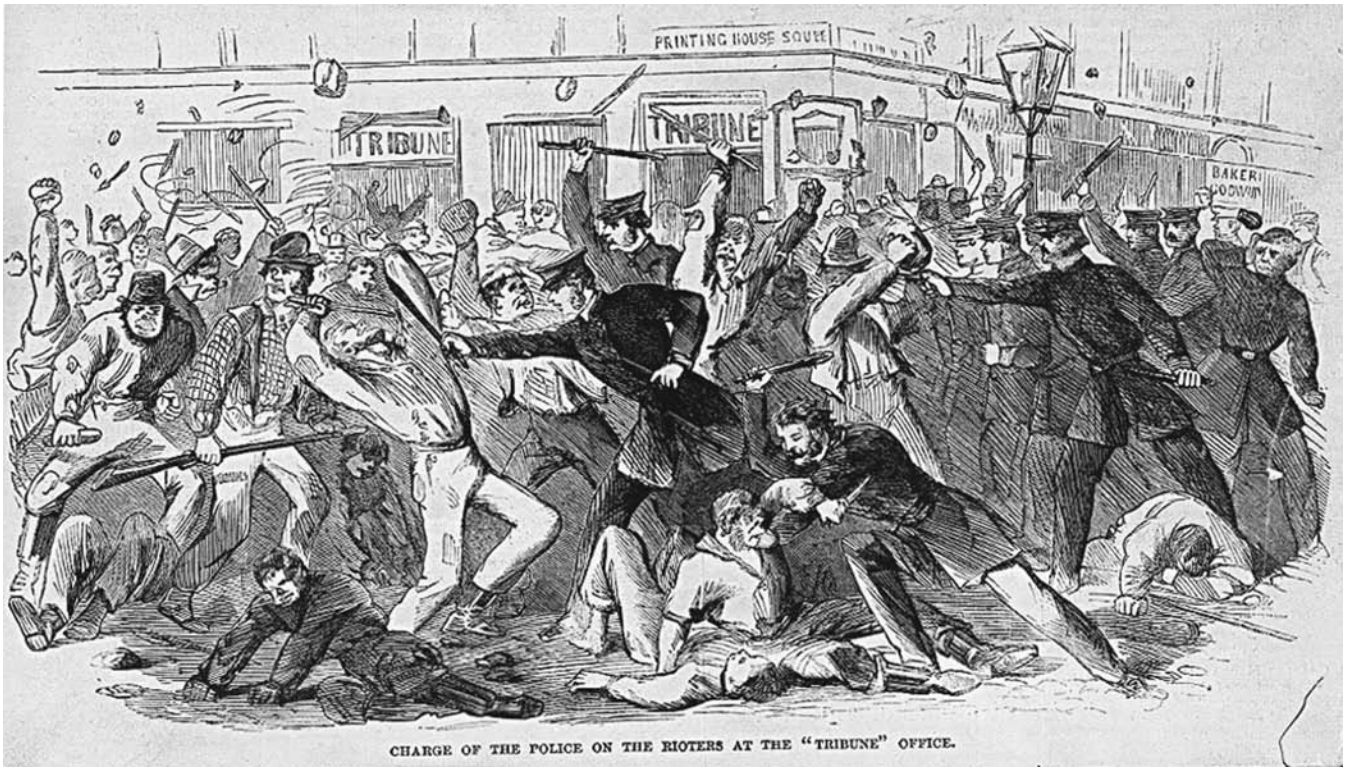


Many of the participants in the New York City draft riots of 1863 lived in the Five Points area, a poor, largely Irish-American neighborhood in Manhattan. During four days of violence, mobs beat and lynched blacks, resulting in more than 100 deaths. *(Collection of the New-York Historical Society)*

litical irrelevancy. Committed to the emancipation of slaves above all else, even the most devout advocates of nonresistance found ways to tolerate the violence that threatened to divide the nation. Radical abolitionist and feminist Angelina Grimké wrote in 1854 that there was no choice but "to choose between two evils, and all that we can do is take the *least*, and baptize liberty in blood, if it must be so." Even the pacifist William Lloyd Garrison offered his qualified support to John Brown's violent raid on the Harpers Ferry armory. And when the Civil War broke out in 1861, most peace advocates lent their support to it on pro-Union and antislavery grounds. Indeed, the most visible signs of antiwar discontent came not from the efforts of the nation's tiny and largely middle-class peace community, but from a crowd of nonpeaceable working-class whites who led the New York City draft riots of 1863. This three-day rampage highlighted racial and class resentments among poor white men who could not buy their way out of conscription but had little sympathy for black freedom's cause. Nonresistance as a mobilizing force, however, fell by the wayside as the "war to save the Union" became a war to end slavery.

Pre–World War I Pacifism

Instead, in the aftermath of the Civil War, at the dawn of the Industrial Age, the quest to promote practical alternatives to war rose to replace the pacifist ideal as the guiding force of American peace reform. It was a



The New York City draft riots of July 1863 were the largest civil disturbance of the nineteenth century. Most rioters opposed both conscription and the Civil War. When police proved unable to quell the violence, President Abraham Lincoln ordered Union soldiers—victorious in the recent Battle of Gettysburg—to New York to patrol the streets. *(Brown Brothers)*

reform shaped by the hallmark values of the Gilded Age—rationality, optimism, and an unabashed celebration of American advancement and power—that stood in striking contrast to the efforts of the prewar reformers. Antebellum peace dissidents had struggled from the political margins as they worked to shape society in God's image and lead the nation away from the sin of war. The Gilded Age reformers, however, drew upon their expertise and connections as members of the educated elite to create a powerful coalition of business leaders, government officials, legal experts, and social reformers. Like other Progressive reformers, peace advocates promoted practical solutions to the "social problems" of their day—in this case the threat of war—by finding "rational" ways to mediate conflict and shape foreign policy. Their emphasis on preventing violence through the arbitration of international conflict dominated peace efforts for almost fifty years, until the outbreak of world war in 1914.

Reaching its peak between the 1880s and the early 1910s, the Gilded Age peace reform firmly linked antiwar efforts to professional internationalism rather than the pacifist idealism of earlier decades. Motivated by the globalization of capital and the search for commercial markets, reformers argued that preventing war was the only way to ensure global trade. Such efforts attracted the support of prominent Americans, like the steel magnate Andrew Carnegie, and cooperation from leading government officials. Even peace-minded clergy couched their quest for peace as a business rather than a moral proposition. As the influential Protestant cleric Josiah Strong characteristically noted in 1898, "We are entered upon the final stage of industrial development, which is the organization of a world-industry. This world-tendency involves also the complete development of a world-life, a world-conscience. And all these involve ultimate international arbitration." The work of Russian czar Nicholas II, who called the First Hague Peace Conference in 1899, seemed to suggest that such mechanisms were possible. The conference's creation of a Permanent Court of Arbitration and its prohibition of the use of certain weaponry as a means to "civilize" and "rationalize" war pointed the way toward a new standard in international affairs.

Nevertheless, a moral pacifist impulse remained as an important undercurrent of antiwar reform. Quakers continued to promote nonresistance as an integral part of their witness for peace, most notably through the work of Alfred H. Love and the Universal Peace Union. Feminists like Elizabeth Cady Stanton and Julia Ward Howe similarly persevered in their belief that women's rights and the pursuit of peace were inseparable goals. Echoing the arguments of other female reformers, feminist peace advocates insisted that women could draw upon maternal concern and, in Howe's words, women's "superior moral force" as powerful weapons against war. By the 1890s, they were joined by the Woman's Christian Temperance Union's Department of Peace and Arbitration, which, as part of the largest grassroots political organization of its time, mobilized its members to work against military conscription, war toys, and schooltime military drills. Finally, there was the influence of Leo Tolstoy, whose writings highlighted a belief in Christian anarchism that upheld the dignity of human life above all else and that denounced violence and force of all kinds. Settlement House leader Jane Addams, one of the most famous social reformers of the Gilded Age, was profoundly influenced by Tolstoy's work. So were a number of other turn-of-the-century reformers, idealists whose desire for peace stemmed from humanitarian concerns.

World War I and the Birth of the Modern American Peace Movement

World War I came as a shock to those who believed that the Progressive principles of order and law would make war between nations obsolete. Instead they faced the horrifying specter of barbarism rising from the heart of the "civilized world" and the growing realization that their efforts to resolve international conflicts with scientific studies and judicial codes would do little to stop the slaughter then making its way through Europe. A movement that relied on reasonable discussion and governmental cooperation had little relevancy in a world where neither of those forces existed. The genteel respectability of the prewar American peace movement had painted itself into a corner from which there was no apparent escape. Its members could only watch the affairs in Europe with dread and dismay.

Out of this crucible of hopelessness, a new American peace movement was born. It began, first, with the women. On August 29, 1914, less than a month after the war in Europe began, approximately 1,500 women silently marched down New York's Fifth Avenue in a parade of mourning and concern. The Parade Committee hoped to stimulate public opposition to U.S. involvement in the European war. Led by prominent women's rights activists, including Fanny Garrison Villard (daughter of abolitionist William Lloyd Garrison), Harriot Stanton Blatch (daughter of the pioneering feminist Elizabeth Cady Stanton), and Carrie Chapman Catt (leader of the National American Woman Suffrage Association), the parade highlighted the special role feminists believed that women should play in the struggle for peace. As mothers, they saw themselves as uniquely devoted to the preservation of human life. As women, they acutely felt the dangers that war posed to their advancement and safety. As suffragists, they argued that only the enfranchisement of women would inject female morality into the political sphere and lead the world to peace.

The organization they ultimately formed, the Woman's Peace Party (WPP), reflected this feminist perspective as well as a determination born of experience in the growing mass movement to win women the right to vote. The New York branch of the Woman's Peace Party, for example, mirrored the militancy of suffrage protests by staging street demonstrations, leafleting at preparedness parades, and booing and hissing pro-war speakers. Other WPP members, though less confrontational, were equally daring in their deeds—particularly the almost fifty women who traveled to Europe as a female peacemaking delegation in the spring of 1915. Internationalism, in fact, became a defining feature of this antiwar effort. So did their public protests, which stood in stark contrast to the staid and respectable demeanor of prewar peace endeavors.

Principled antimilitarism gave birth not only to the WPP, but to numerous other antiwar groups that attracted tens of thousands of men and women to their cause. There was the American Union Against Militarism (AUAM), whose mass meetings and Washington office provided an outlet for those who wanted to act decisively against the growing tide of military preparedness. Chicago activists, including the venerable Jane Addams, by this point one of the most famous women in the nation and a leading member of the WPP, convened the Emergency Peace Federation to defend the Progressive reform agenda from the ravages of war. Christian pacifists, heirs to the nonresistance tradition of the nineteenth century, gathered together in the nondenominational Fellowship of Reconciliation. Smaller local groups similarly tapped into widespread public antiwar desires. For the first time

in U.S. history, a truly national movement existed with peace at its center.

The World War I–era antimilitarists were broad thinking and politically savvy. Veterans of successful social reform campaigns and experienced in the workings of political life, this new generation of antiwar activists took themselves seriously as organizers and agents of change. The leaders of the AUAM, for example, could pride themselves on building an organization that had over 15,000 members, distributed literature in the hundreds of thousands, maintained a sizable national mailing list, lobbied in Congress, and published articles in the leading reform-minded journals of the time. Like their antebellum predecessors, these activists saw their antiwar efforts as part of a much larger struggle for social and political change. They believed, on the most fundamental level, that militarism threatened the democratic institutions that they held dear. Only by achieving social justice, they argued, could a lasting peace be forged. The struggles of the suffrage and labor movements, of antipoverty campaigns, and for women's rights—struggles in which they had all taken part—became part and parcel of their antiwar reform.

Up until the moment that the United States entered the war, the Progressive peace movement maintained its fervor, intensity, and public support. In the early months of 1917, as tensions between the United States and Germany reached the breaking point, a sense of urgency took over the anti-intervention campaigns. Mass rallies, lobbying efforts, and full-page newspaper ads alerted the nation to the growing danger and signified the persistence of a public antiwar impulse. But as the inevitability of war grew, the movement experienced critical signs of attrition. Local groups folded. Key members of the WPP and the AUAM resigned. Nevertheless, even on the eve of war, antimilitarist forces were able to hold a rally in New York's Madison Square Garden whose crowd overflowed into the street.

All of this changed when Congress declared war on Germany in April 1917. Public support for the antiwar cause evaporated overnight, its decline aided in part by passage of the Selective Service Act that May and the Espionage Act in June. Conscription brought the heavy hand of the state down upon those men who hoped to avoid participating in the war. But it was the Espionage Act, which empowered the federal government to censor newspapers, ban the mailing of publications, and imprison anyone who "interfered" with the draft or voluntary enlistment, that sent a palpable chill through antimilitarist circles. Not surprisingly, the threatened penalty of twenty years in prison and a $10,000 fine dramatically narrowed the range of acceptable public debate. Activities that had once been legal, though controversial, were now prohibited by law. As Jane Addams recalled after the war, pacifists and antimilitarists essentially became "outlaws." Only the most stalwart dissenters remained within the peace movement's fold. Most other Progressives left, having decided that it was futile to oppose government policy; instead, they worked to influence the conditions of the postwar peace.

Thus, the declaration of war profoundly changed the basic parameters of antiwar activism in the United States. Activists regrouped, first in the new People's Council of America for Peace and Democracy, whose platform called for an early peace, the repeal of conscription, safeguarding the rights of labor, and protecting civil liberties and basic democratic rights. Its leftist orientation attracted members of the Socialist Party and the Anarchist labor movement—radicals who feared that what they considered a capitalist and nationalist war would only undermine their efforts on behalf of the working class. The Espionage Act, however, put these groups on a collision course with the wartime assault on radical dissent. Federal authorities arrested and imprisoned numerous leaders of the Socialist Party and the Industrial Workers of the World (IWW) for sedition. Even those who weren't arrested found it almost impossible to organize and meet. The postmaster general barred antiwar and Socialist publications from the mail, making communication difficult at best. And when the People's Council tried to convene a constituent assembly during the summer of 1917, mobs and local police closed down the meeting halls and drove its leaders out of town. Activists across the country were shocked by the intensity of government repression and by how quickly it had pushed them to the political margins.

Religious pacifists and conscientious objectors to military service (COs), though small in number, found the times trying as well. Federal legislation granted members of the historic peace churches exemption from military combat, for the first time providing a legitimate avenue of nonresistance to pacifist adherents. But the government forced those it granted official CO status to work in the military in noncombatant roles, thus turning them into soldiers who simply did not carry guns. In addition, the federal CO provisions explicitly excluded pacifists not specifically affiliated with the historic peace churches, thus closing off all options except outright resistance. As a result, over 1,400 men, one-third of all those who

claimed CO status, spent the war imprisoned in military confinement and subject to physical and psychological abuse.

Given the difficult nature of their wartime task, a number of antiwar advocates turned their attention to the defense of civil liberties and constitutional rights. Two feminist pacifists, Tracy Mygatt and Frances Witherspoon, founded the Bureau of Legal Advice, which furnished organized help for conscientious objectors and free speech victims. The AUAM followed suit with a Civil Liberties Bureau that lay the groundwork for the founding of the American Civil Liberties Union (ACLU). Over the next several years, these two groups provided legal advice and prepared affidavits for thousands of antiwar protesters and COs.

By the time the war ended with the armistice of November 1918, the American antiwar movement had been radically transformed. No longer the domain of eminent men who hoped to use arbitration and the rule of law to make the world safe for global commerce, the movement had become a haven for reformers and radicals, women and men, seeking to create social change by fostering peace. In its recognizably modern form, the peace movement became an organized voice of collective protest that linked social justice to the pursuit of a nonviolent world.

The Antiwar Zenith of the Interwar Years

The end of World War I, however, did not necessarily mean peace for those involved in the antiwar movement. Building on the political repression of the wartime years, the United States experienced a postwar wave of anti-Communist hysteria—a Red Scare—that effectively stifled whatever political dissent had not already been stamped out. What began in 1919 as a government crackdown on domestic radicalism and the mass deportation of "enemy aliens" (mostly IWW members and Anarchists) continued through the 1920s when the nation entered an era as famous for its political conservatism as it was for its cultural experimentation. Peace advocates, now tied in the public's mind to radical causes, became easy targets. Even the venerable Jane Addams, once one of the most highly esteemed women in the nation, was not immune from attack as "subversive" and "un-American." Nevertheless, the antiwar movement, backed by a committed core of experienced leaders, continued to work toward its new postwar goals of disarmament, the abolition of war, and the pursuit of social justice on a national and international scale.

Even within this harsh climate, the antiwar movement tapped a raw nerve in the public psyche. The atrocities of World War I had led to a widespread social and cultural revulsion to war, a sense of disillusionment that, despite the Red Scare, made sizable sectors of the American public open to the message and goals of peace advocates. War stories by Ernest Hemingway, John Dos Passos, and, most famously, Erich Maria Remarque in his best-selling novel, *All Quiet on the Western Front* (1929), spread images of senseless horror that countered the wartime discourse of honor, civilization, and patriotic duty. Scholars published research arguing that collusion and manipulation on the part of the Allies, and especially leading industrialists and munitions manufacturers, had caused a war that was, at its root, about earning profits, not saving democracy. By the early 1930s, even the terms of the postwar peace had come up for public critique. The rise of fascism in Germany and Italy suggested the limits of a war ostensibly fought to make the world "safe for democracy." To many Americans, the solution was clear: make sure that such a war never happened again.

The Women's Peace Movement

Stripped of their prewar optimism but not of their sense of political influence and power, female activists—leaders and members of the Woman's Peace Party—began a multifaceted campaign for disarmament and the outlawing of war. Feminists had achieved a major victory with passage of the women's suffrage amendment in 1920. Now, convinced that women could act as a united and potent political force, they turned their attention to the problem of war. As in earlier efforts, many of these female leaders argued that women had a unique role to play in the work for peace, not just as mothers but as worldly and experienced political reformers. They saw their work as an extension of "municipal housekeeping"—their earlier (and successful) efforts to reform the state—which they now hoped to take to the international stage.

Through organizations such as the Women's International League for Peace and Freedom (WILPF), the Women's Peace Society, the Women's Peace Union, and the National Committee on the Cause and Cure of War (NCCCW), former suffragists became the backbone of the interwar peace movement. Determined to work on the inside of a political system they had just gained official access to, these women mobilized their vast constituencies, elected political allies, and lobbied Congress in pursuit of their goals. WILPF, the recon-

stituted successor to the Woman's Peace Party, pursued a primarily legislative strategy. Led by the indomitable Dorothy Detzer, WILPF played a dominant role in the Washington "peace lobby" of the 1920s and 1930s—working tirelessly for universal disarmament under the auspices of the League of Nations and fighting to secure U.S. participation in a world court of justice. WILPF's pursuit of legal alternatives to war was augmented by the efforts of the Women's Peace Union, which sought, unsuccessfully, to introduce a constitutional amendment prohibiting war, and the NCCCW, which, under the directorship of former suffrage leader Carrie Chapman Catt, organized a vast membership of over 5 million women in outreach and educational campaigns.

Paralleling the development of these sizable women's peace efforts was the rise of the nation's first mass student movement. Organized in response to the social conditions of the Great Depression, a diverse coalition of college radicals came together in late 1931 to seek action-oriented solutions to the problems of poverty, joblessness, and economic collapse. By 1933, the movement had pushed the issue of world peace to the center of its political agenda, a decision that facilitated the movement's spread from its center in New York City to campuses across the country. Not surprisingly, college students were among those most disillusioned by the "lessons" of World War I. As youthful idealists, they looked back in horror at the domestic repression that went hand in hand with militarization in the United States. On a more personal level, they feared becoming the next generation of casualties in the next "Great War." Students converted to pacifism and antimilitarism in unprecedented numbers. Beginning in the spring of 1933, tens of thousands took the Oxford Pledge, by which they renounced personal participation in any war. A national student poll that same semester documented the widespread nature of these antimilitarist beliefs: 39 percent of those polled supported the Oxford Pledge, while another 33 percent stated that they would fight only if the United States itself was attacked. Student demonstrations between 1934 and 1936 pushed the campus peace campaigns to a militant edge that reached its peak in April 1935, when 60,000 students boycotted classes as part of a national student strike against war.

Much of the push for this student peace movement came from the ranks of the radical left, Communists and Socialists who saw the antiwar cause as intimately linked to a much wider struggle for social justice and social change. In their opinion, wars were the work of "vested interests," the businessmen and industrialists who had been implicated in the Nye Committee's 1933 congressional investigation of war profiteering and the munitions industry during World War I. From the perspective of student radicals, undermining the power of ruthless capitalists thus removed a major obstacle to world peace. They threw themselves into the labor movement, providing support and publicity to working-class struggles during a crucial moment in U.S. labor history. This largely white group of student activists also took up the banner of interracial justice by organizing campus campaigns to abolish Jim Crow. As with their antiwar forebears of World War I and the pacifists of the nineteenth century, student radicals saw the struggles for peace and justice as part and parcel of the very same cause.

These connections gained credence in the early 1930s as news of Mohandas Gandhi's nonviolent struggle against British colonial rule in India reached the United States. Pacifist clergy in particular—the third major branch of the interwar peace movement—embraced Gandhi's example with zeal. The Fellowship of Reconciliation (FOR), which had become the leading venue of radical Protestantism in the years since World War I, had been striving for years to apply the precepts of the Social Gospel—the idea that American Christians had the responsibility to use their power and privilege to create a better world—to its work for peace. What Gandhi provided was proof that nonviolence could work as an effective, and "Christian," alternative to war. Quaker lawyer Richard Gregg publicized Gandhi's experimental techniques in his widely read 1934 book, *The Power of Non-violence*, which FOR members studied as they theorized about how to apply these tactics to their work, and thus transformed the meaning of Christian pacifism in the United States. The traditional doctrine of passive nonresistance had long stood at the center of pacifist theology. But many believed it was no longer enough to simply refuse to fight. With Gandhian nonviolence, it was now possible to resist.

Together, Christian pacifists, student radicals, and feminist internationalists built a powerful and far-reaching antiwar movement. By the mid-1930s, they had developed a solid constituency, political allies, and a developing theory of nonviolence that would have surprised the beleaguered pacifists of 1919. The challenges of the late 1930s, however, would put this coalition to the test.

Pacifism and Neutrality Meet World War II

The antiwar movement of the 1930s, for all of its popular support, faced an insurmountable obstacle to its quest for world peace: the rise of fascism and militarism in Europe and Asia. The threat first appeared in 1931, when Japanese troops invaded Chinese Manchuria. By the mid-1930s, the threat had reached Europe with the Nazis' rise to power in Germany, Mussolini's invasion of Ethiopia, and the carnage of the Spanish Civil War. The world now teetered on the edge of another total war, and peace advocates needed to formulate a response. The bulk of the peace movement initially gathered under the banner of "neutrality." Like their antimilitarist counterparts of World War I, they sought to prevent U.S. involvement in the conflict overseas. But as international tensions deepened, the movement disintegrated, leaving only the most absolute pacifists behind and tainting the movement with a stain of treason that would follow it for years.

At first, however, it seemed that neutrality, specifically *strict* neutrality, would provide a workable solution to the problem of U.S. involvement in the spreading global conflict. Strict neutrality differed from prior practices in that it prohibited *all* trade with belligerent nations. Critics had blamed "neutral" commerce for having aggravated international tensions in the 1910s and pulling the United States into World War I. Now activists worked to implement a stricter definition. In 1935, pacifists from the FOR, WILPF, and the American Friends Service Committee (AFSC) joined with liberal internationalists to form the Emergency Peace Campaign (EPC). Although strict neutrality played a key role in the EPC's program, its ultimate goal was not to isolate the United States from international affairs. On the contrary, EPC leaders believed that strict neutrality had to go hand in hand with an internationalist program that stressed transnational cooperation and political democracy around the globe. In the mid-1930s, activists still believed that such a program held significant promise.

The EPC opened with high hopes. Leaders launched the campaign in April 1936, during the third year of nationwide student strikes for peace and amid continued support for the Oxford Pledge. By the spring of 1937, the campaign had grown enough to launch an ambitious and broad-based "No-Foreign-War Crusade." This "crusade," like other EPC efforts, reflected the coalition's internationalist interpretation of neutrality. Organizers distributed literature, held public meetings, and conducted workshops to educate the public about developments in Europe and Asia. Speakers traveled across the country, and staff members and campaign leaders met directly with senators and congressmen to gain sponsorship and support for neutrality legislation. Although political victories proved elusive, organizers were pleased with the publicity and enthusiasm their efforts gained. There still seemed to be popular support for a movement against war.

But tensions in Europe proved stronger than peace advocates expected, and by 1940 the interwar movement had fallen apart. The Communists left first, convinced by the events of the Spanish Civil War that direct action was necessary to overcome Fascist aggression. By the spring of 1938, nonpacifist internationalists had also abandoned the neutrality effort to advocate on behalf of U.S. intervention in the anti-Nazi struggle. Liberal pacifists joined with Socialists in the short-lived Keep America Out of War Coalition, but they themselves left in 1940 when the coalition allied with the right-wing and isolationist America First Committee. From there, the pacifists and the peace movement were on their own.

This remaining remnant quickly found itself isolated and derided. The Japanese attack on Pearl Harbor in December 1941 only accelerated a trend that had started several years before. As historian Lawrence S. Wittner notes, "Americans now renounced pacifism with the same fervor with which they had previously renounced war." The public viewed antiwar advocates as delusional cowards and blamed them for the appeasement policies that had given Adolf Hitler a foothold in Europe. At a time when supporting the war effort defined the meaning of patriotic service, even principled pacifism was viewed as "un-American." Ostracized from the mainstream of American political life, and even from the radical left, pacifists turned inward—gathering in religiously oriented organizations like the FOR and the AFSC, and the more secular War Resisters League (WRL) and WILPF, for mutual support.

Conscientious Objectors

The status of COs quickly moved to the top of the peace movement's agenda. Prodded by leaders of the historic peace churches, the federal government included provisions in the 1940 Selective Service Act that not only secured exemption from military service for religiously based pacifists, but established Civilian Public Service (CPS) camps where COs would live and engage in work "of national importance." Most

DAVID DELLINGER (1915–)

Born in Wakefield, Massachusetts, on August 22, 1915, David Dellinger is a descendant of old New England families and the son of a well-to-do Boston family. He graduated from Yale University in 1936 and studied at Oxford University, Yale Divinity School, and Union Theological Seminary (1939–1940). Dellinger's dedication to antiwar causes began early in life and would lead him to the forefront of militant, nonviolent activism.

After graduating from Yale, Dellinger went to England in 1937 to study at Oxford. While on vacation, he traveled around England and read and learned about St. Francis of Assisi, an experience that deeply influenced his future. He returned to America and entered the Union Theological Seminary. Dellinger, with other members of the seminary, started the Newark Commune. The commune, located in the ghetto of Newark, functioned as a cultural center for the black and white children of the neighborhood. The commune also served as a buying program that purchased a farm in Chester, New Jersey, and turned it into a communal farm. When World War II broke out, Dellinger refused to register for the draft despite his eligibility for a deferment as a seminary student and, as a result, was sentenced to three years in prison. He held hunger strikes in prison to protest how prisoners were treated. The protests eventually led to more humane treatment and also the desegregation of the federal prison system.

Upon his release in 1945, Dellinger formed the Libertarian Press, a printing cooperative. During the 1940s and 1950s, he took part in many demonstrations and nonviolent protests. In April 1950, he participated in a two-week fast in Washington to protest the making of the hydrogen bomb. He also participated in sit-ins at the Atomic Energy Commission in Maryland and New York City.

Later, Dellinger actively opposed both the Korean War and the Bay of Pigs Invasion. In 1956, he became editor and publisher of *Liberation*, a major voice of radical pacifism. The magazine focused on the causes of civil rights, anarchism, decentralism, nonviolent direct action, and others.

As an opponent to American involvement in Vietnam, Dellinger was a major link to the North Vietnamese government and facilitated the release of American prisoners of war. He was arrested as a leader of the antiwar demonstration that erupted in riot at the Democratic National Convention in Chicago in 1968 and was charged as part of the "Chicago Seven"—the popular name of the seven radicals accused of inciting the Chicago riots, and was sentenced to five years. The conviction was later overturned.

Emphasizing the need for radical change as well as nonviolence, Dellinger became editor of *Seven Days* magazine (1975–1980). In the 1980s, he moved to Vermont to teach and write. He has continued his activism, speaking at the "Stop the Drug War" rally in Chicago near the 1996 Democratic Convention. He also regularly fasts in an effort to change the name of Columbus Day to "Native American Day."

James G. Lewis

of this work involved menial tasks like digging ditches and building roads, but the almost 12,000 pacifists who entered these camps, largely run under the direction of the peace churches themselves, lived in conditions far superior to those of their World War I forebears. Although not a perfect system, most pacifist leaders viewed CPS as a giant step forward in the government accommodation of COs.

The men who served in the camps, however, were not always so sure. Since COs were drafted just like ordinary Americans, their presence in the camps was anything but voluntary. Unlike soldiers, however, CPS men were not paid for their service. Instead, the peace churches had to raise funds for the camps' operating expenses while the men had to find ways to support themselves and their families. Work assignments proved problematic as well. As a rule, most COs were happy to donate their skills and energy to important works of service. But as highly educated men with idealistic goals, the work to which they were assigned, generally unskilled physical labor, only added insult to injury. "How can we be content day after day to manicure mountains," one CO complained, "when the world has such crying need for practical real help and help that we want to give." As the war, and their grievances, progressed, growing numbers of COs came to view CPS more as a form of state-sponsored punishment than as an experiment in alternative national service.

Many began to rebel. Inspired by the radical labor movement of the 1930s, men in the CPS camps initiated work stoppages and slowdowns. The more frustrated camp members simply walked out. Leaving the camps did not mean freedom, but rather the opposite,

since such noncooperation violated federal law. The COs who walked out simply exchanged one prison for another: CPS for the federal penitentiary. There they joined men who had refused to cooperate—for reasons of conscience, religion, and politics—with the draft in any way or form. Over the course of the war, approximately 6,000 hard-line resisters, uncompromising pacifists, and deserting CPS men—one-sixth of the total federal penal population—served federal prison terms, where they continued their protests, albeit in a different form.

Their biggest challenge was to justify their pacifism in the face of Nazi atrocities and overwhelming popular support for the war. For those who took the biblical commandment not to kill at its word, however, there was little choice. This had always been the position of the historic peace churches. A.J. Muste, the nationally renowned leader of the FOR, named by *Time* magazine as "The Number One U.S. Pacifist" in 1939, echoed these sentiments when he publicly insisted that since "all men were brothers" it was immoral to kill. But he also blamed the rise of fascism on economic domination, global imperialism, and the flawed peace of World War I. Still others pointed to Gandhi, who propagated the view among many throughout the world that war was immoral.

The Color Bar

For the imprisoned COs, Gandhian nonviolence also became a practical tool of transformation and radicalization. Working from an incipient understanding of nonviolent direct action techniques, a group of draft resisters began to demonstrate against racial segregation inside the federal prison system. The color bar was everywhere, even in the Northern institutions. To resisters like the black pacifist Bayard Rustin and the white militant James Peck, segregated dining tables and dormitories were a grievous affront that required an immediate response. By mid-1943, their protests, which included a combination of prolonged work and hunger strikes, had spread through the federal penitentiaries that housed militant COs. Authorities responded by separating the protesters and putting them in solitary confinement, but the resisters sent word of their actions to the outside world, successfully publicizing their efforts to a larger community of support.

The nonviolent prison protests against Jim Crow mirrored similar campaigns being waged in the streets. Pacifists had latched on to the wartime surge in civil rights protests, inspired in part by black labor leader A. Philip Randolph, who led the 1941 March on Washington Movement that forced President Franklin D. Roosevelt's administration to act against racial discrimination in the war industries. The FOR developed close ties to Randolph and, encouraged by Randolph's assertion that the "evil of racism" could be overcome by "nonviolent, good-will direct action," adopted the civil rights issue as one of its own. FOR members helped found the Congress of Racial Equality (CORE) in 1942, which provided pacifists with a venue for constructive wartime work and an outlet for their experiments with Gandhian techniques. CORE's local chapters used pickets and sit-ins to combat segregation at lunch counters, restaurants, movie theaters, and amusement parks, and helped keep pacifism relevant during a difficult time.

The Waning of the Peace Movement

By the end of the war, the American peace movement had dwindled to a small but hardened core of dedicated pacifists. Organizations like WILPF, which had worked to attract nonpacifists to the antiwar cause, emerged battered yet still intact. Purely pacifist organizations, like the AFSC, FOR, and the WRL, actually saw their memberships rise during the wartime years even as their broad bases of support shrank. Isolated pacifists sought each other out for much-needed fellowship. Solidarity helped to strengthen their resolve, while experiments in nonviolent action paved the way toward a new direction in antiwar protest.

The Struggle Against McCarthyism and the Bomb

Ultimately, it was how World War II came to an end that most profoundly shaped the antiwar movement of the postwar years. With the dropping of atomic bombs on the Japanese cities of Hiroshima and Nagasaki in August 1945, the United States simultaneously ushered in the nuclear age and paved the way for the Cold War. The nuclear threat made the struggle against war all the more urgent, as did the growing tensions between the United States and the Soviet Union. Meanwhile, growing fears about Soviet expansionism set off another Red Scare on American soil. At a time when the stakes seemed higher than they ever had been before, the opportunities and tolerance for political debate shrank. Those who challenged U.S. foreign and military policy were deemed subversive and dangerous enemies of the state. Antiwar advocates faced new challenges and unfamiliar threats.

Atomic scientists were among the first to organize

in opposition to the bomb. As the people most directly responsible for its development and most knowledgeable about the consequences of its use, they felt a special responsibility to bring the burgeoning arms race under control. Under the banner of "One World or None," prominent scientists like Albert Einstein, Linus Pauling, and Leo Szilard joined together as the Emergency Committee of Atomic Scientists. From the committee's perspective, atomic weapons made wars dangerously obsolete. "Time is short," they argued, "and survival is at stake." The only solution, they believed, was to prevent international conflict through powerful institutions of world government. The scientists' stature brought them instant acclaim, although their message lost its appeal once the Cold War set in. By the summer of 1946, Americans had replaced their fear of nuclear weapons with an even greater fear of the Soviet threat. The atomic scientists' movement continued but without its necessary support.

The Soviet Threat

More traditional peace constituencies faced even greater obstacles to success as anti-Communism came to dominate American politics, culture, and life. The wartime alliance between the United States and the Soviet Union began to break down in 1945. By 1946, U.S. government officials were characterizing the Soviets as a threat to democracy across the globe. Fears of Communist infiltration quickly consumed the minds of American politicians and the public at large. In 1947, President Harry Truman pushed through a program of loyalty oaths that trickled down to state and local levels. By 1950, the effort to root out Communist subversion, now labeled "McCarthyism" after Senator Joseph McCarthy's anti-Communist crusades, had become a national obsession. The House Un-American Activities Committee (HUAC) held virtual nonstop meetings that interrogated Americans from all walks of life. Congress passed the McCarran Act, requiring Americans who belonged to government-identified Communist or Communist-front organizations to register with federal authorities. Government surveillance and harassment of dissidents increased and spread into the popular culture. Although the United States had a long history of antiradical crusades, McCarthyism brought such efforts to an all-time high.

The Cold War and the Red Scare redefined patriotism and loyalty in ways that undermined almost every organized antiwar endeavor. Public pronouncements equated "peace" with containing Communism through military strength and deemed any other definition as "unpatriotic." The government did everything it could to neutralize the peace movement itself, using overt political harassment to complement the growing cultural antipathy for dissent.

Communist-led peace campaigns, which criticized U.S. foreign policy without questioning the military buildup of the Soviet Union, only helped to brand non-Communist antiwar efforts, still reeling from their marginalization during World War II, with the indelible mark of subversion. As experiences within the movement suggest, peace activists themselves could do their share to undermine the work and unity of organizations struggling to stay alive.

WILPF, for example, at first appeared to be on sound footing. Although its membership had dropped dramatically over the course of the war, it had managed to survive with the help of strong leaders. In 1946, as a testament to WILPF's vision of feminist internationalism, the Nobel Peace Prize committee granted its prestigious award to one of WILPF's founding members, Emily Greene Balch. WILPF had also begun to reorganize its work—putting a new emphasis on the dangers of the nuclear age—and to renew its membership base. With the advent of McCarthyism, the organization took up the causes of free speech and civil liberties even as its leaders insisted that WILPF's democratic vision was incompatible with Communist doctrine. WILPF publicly prided itself on welcoming all who subscribed to its antimilitarist program.

Despite WILPF's "anti-anti-Communist" stance, conflicts flared in a number of local chapters—Denver, Chicago, and metropolitan New York—as members argued about how to protect themselves from the dual threats of internal Communist subversion and external charges of Communist infiltration. Suspicion ruled as branch leaders investigated new members, pried into the histories of its most active local leaders, and persecuted those whom they believed had Communist ties. The results were disastrous. WILPF lost some of its most able and dedicated organizers. Equally damaging, the atmosphere of paranoia divided and crippled the work of its local chapters and diverted energy away from the organization's national campaigns.

McCarthyism helped turn the late 1940s and early 1950s into the nadir of twentieth-century peace advocacy, not just in WILPF, but in the movement overall. It was not that antiwar activism did not continue. Numerous activists and organizations persisted in their efforts to respond to the arms race, conscription,

the Korean War, and the continuing struggle for racial justice. But their numbers were small and their influence too weak to make a dent in public policy or opinion. The combination of paranoia from within and hostility from without took a toll on a movement already struggling in the aftermath of its World War II decline.

The Civil Rights Movement

Unexpectedly, in the mid-1950s, the situation suddenly changed. Rising concern about the dangers of atomic testing reached a crescendo as the general public gained knowledge about the health hazards of radioactive fallout. Then, in 1955, a bus boycott in Montgomery, Alabama, led by the young Reverend Martin Luther King Jr., ignited the civil rights movement and helped break down the Cold War's barriers to protest. For peace activists who had cut their teeth on the jailhouse demonstrations and interracial struggles of World War II, the Montgomery boycott was a monumental event. As the editors of the radical journal *Liberation* wrote in 1957, "Not since the death of Gandhi [in 1948] has there been so much discussion of nonviolence as there is today." Many pacifists believed that the time was now right to start a nonviolent movement of their own.

These stirrings of discontent brought almost immediate results. In 1955, the first protests appeared in New York City during the municipally mandated civil defense drills. Then, in 1957, a broad coalition of antiwar activists came together to organize the Committee to Stop H-Bomb Tests. Within months, this committee had devolved into two parallel disarmament organizations: the Committee for a Sane Nuclear Policy (SANE) and the Non-Violent Action to Abolish Nuclear Weapons (NVA). SANE harnessed liberal opposition to nuclear weapons testing, and its program of newspaper advertisements, petitions, and literature distribution attracted tens of thousands of members. NVA, on the other hand, with its calls for unilateral disarmament and direct action against the bomb, acted as the new home for a smaller but dedicated group of radical pacifists. Together, these two groups mobilized public sentiment and brought the campaign against nuclear weapons to the front pages of the nation's news. By 1960, the peace movement had been reborn.

The distinct orientations of SANE and NVA (later reorganized as the Committee for Nonviolent Action [CNVA]) highlight the diverse nature of this reconstituted movement. SANE had one basic goal: a comprehensive ban on nuclear testing. Leaders viewed this objective as the first step toward nuclear disarmament and the easing of Cold War tensions but insisted on maintaining their singular focus. This decision was a tactical success. SANE reached out to a large and only moderately politicized community, gathered signatures for its acclaimed newspaper advertisements, and organized enormous marches and rallies—all designed to pressure Congress to pass a nuclear test ban.

CNVA, on the other hand, placed the ban on nuclear testing within a much broader political agenda that challenged the very foundations of the Cold War. Taking Gandhian nonviolence to the next level of protest, CNVA members staged a series of dramatic civil disobedience campaigns: they trespassed on the Nevada nuclear test site, sailed into the Pacific nuclear test zone, blockaded trucks heading into nuclear facilities, and climbed aboard nuclear submarines. These radical pacifists cast themselves as the revolutionary vanguard of the antiwar struggle, not as the leaders of the moderate mainstream. Like the Garrisonian abolitionists of a century before, they saw themselves as the necessary and uncompromising voice of moral protest whose work would broaden the boundaries of political debate.

The combined efforts of SANE and CNVA mobilized a groundswell of opposition to nuclear testing and nuclear arms. SANE was an almost immediate success. By 1958, it counted almost 25,000 members in 130 local chapters. News reports in 1959, which revealed that radioactive fallout, particularly Strontium 90, had been absorbed into the nation's food and milk supply and now appeared in the bones and teeth of children far away from the actual tests, only increased public support for the antinuclear movement. In 1959, SANE and the AFSC co-sponsored an annual series of Easter marches for peace that by April 1961 attracted over 20,000 people. Even CNVA's militant actions garnered sizable support. And although SANE lost its lead in the test ban struggle in the spring of 1960, after anti-Communist purges left the organization bitterly divided, the movement continued to grow. The emergence of Women Strike for Peace (WSP)—which brought over 50,000 concerned housewives and mothers into the streets in defense of their children's futures, and which successfully stood up to the intimidating tactics of HUAC—and the Student Peace Union—which attracted growing numbers of students to the antiwar cause—indicated how antinuclear protests, even in the midst of the Cold War, could move from the political margins into the mainstream of American liberal dissent.

Decline of the Movement

These forces won a victory of sorts with passage of the Partial Test Ban treaty in 1963. No one doubted that this was a diplomatic breakthrough. But, as SANE had recognized from the start, the treaty was only a first step that had serious limitations. It did not end nuclear testing; it only moved it underground. Nor did it halt the continued escalation of the arms race or the development of new and more deadly nuclear weapons systems. It did, however, pull the rug out from under the peace movement's efforts. With passage of the treaty, many recruits to the antinuclear cause believed that they had accomplished their primary aim. The impetus for widespread activism disappeared while the organizations, which still believed that much needed to be done, scrambled to maintain some degree of momentum and visibility.

In the wake of their greatest success, the peace movement hit hard times. Groups like SANE and WSP stagnated. Radical pacifists in CNVA bemoaned the test-ban agreement and the movement's subsequent decline. What they failed to recognize, however, were the movement's more subtle successes. SANE and WSP had helped bring the antiwar movement back into the political mainstream—no small feat in the conformist climate of the Cold War. CNVA, with its dramatic acts of civil disobedience, similarly helped to popularize nonviolent direct action techniques beyond those employed in the emerging civil rights struggle. Finally, as historian Charles Chatfield notes, the combined efforts of the movement helped antiwar activists gain political influence as they "forced the government" to admit its mistakes and "acknowledge dangers it had masked." Although activists could not know it at the time, these developments, and the changes they had fostered in the national political culture, would soon help their movement confront a new crisis and build widespread opposition to an unpopular war.

The Peace Movement, the Antiwar Movement, and the Vietnam War

The signs appeared almost immediately. In the fall of 1963 and the spring of 1964, new chants began to punctuate liberal and radical peace gatherings and demonstrations: "End the War in Vietnam, Now!" Since the mid-1950s, the U.S. government had grown increasingly involved in sustaining the anti-Communist state of South Vietnam, the southern half of the former French colony that, in its fight for independence, had unwittingly become a pawn in the Cold War. U.S. military intervention started out slowly, but by 1963 the nation had wholeheartedly committed itself to supporting the brutally corrupt, but ardently anti-Communist, South Vietnamese regime. To a small but growing number of activists, these developments suggested that U.S. foreign policy had taken another dangerous turn. Groups like WILPF, WSP, SANE, the FOR, the WRL, and CNVA turned their attention toward Vietnam, adding it to their long agendas of political concern. Little did they know how quickly the Southeast Asian conflict would overshadow their internationalist and disarmament efforts, consuming the movement and transforming the antiwar struggle.

Pacifists led the way in the years leading up to 1965, although, as in the 1950s, their demands and strategies varied. Radical pacifists favored direct action protests, including burning draft cards and sitting in at military installations, as their tactic of choice. For them, there were no halfway measures. Just as they had espoused "unilateral disarmament" during the ban-the-bomb struggle, they now called for "immediate withdrawal." So, too, did they emphasize acts of personal witness—civil disobedience protests that carried the risk of arrest and jail—which demonstrated commitment through sacrifice and which highlighted the need for individuals to take a moral and uncompromising stance against violence and war. Liberal pacifists, on the other hand, focused their energy on education, lobbying, and outreach. Rather than rejecting the roots of American foreign policy, they simply sought to reform it. They believed that their moderate tactics and call for a "negotiated settlement" to the war would inspire large numbers of Americans to speak out in protest.

But it was the war itself, rather than pacifist leadership, that mobilized people to gather in opposition. In winter 1965, President Lyndon Johnson inaugurated Operation Rolling Thunder, launching massive bombing raids and substantially increasing the number of U.S. troops stationed in Vietnam. Johnson's policies sparked an almost immediate response on the nation's college campuses. Faculty and students at the University of Michigan spontaneously initiated a new form of protest, the teach-in, which spread to over 100 campuses before the semester's end. The teach-ins captured public attention and gave tens of thousands of young people the information they needed to challenge Johnson's foreign policy decisions. An April march and rally, sponsored by the radical Students for a Democratic Society (SDS), similarly gave notice that a new force in antiwar politics had arrived. Much to

SDS's surprise, its march against the war brought 20,000 supporters into the streets of Washington, D.C., making it the largest peace demonstration in the capital city until that time, and the first major demonstration against the war.

Students quickly became the most visible group in this new and evolving movement. In part this was because of the draft, which brought the war home to male students in a very personal way and which became the focus of widespread resistance actions. The existence of organizations like SDS helped as well. Established in the early 1960s to seek broad social change through campus reform and inner-city organizing campaigns, SDS quickly became a vital conduit that linked masses of students in its local chapters to the national antiwar struggle. Then there was the rise of the counterculture, which helped bring youthful rebellion to the forefront of national consciousness. Best known for their promotion of "sex, drugs, and rock and roll," dungaree-clad hippies also embraced the values of "authenticity," "community," and "liberation." Many saw the antiwar movement as yet another venue to express political dissatisfaction and visionary idealism. Although their presence often alienated mainstream America, their gentle nature softened the hard-line politics of student leftists and committed pacifists, and helped attract a wide range of young people to rallies and demonstrations. Before long, hippies and protesters, the student movement, and the antiwar movement came to be seen as one and the same.

The movement against the Vietnam War, however, was about more than just youthful rebellion. In early 1966, religious leaders came together in Clergy and Laity Concerned About Vietnam (CALCAV) to spearhead a faith-based constituency of Americans organized to end the war, and scored a major coup when civil rights leader Martin Luther King Jr. joined their ranks later that year. Mainstream Democrats, prodded by liberal peace groups like SANE, WILPF, and WSP, also began to speak out openly against the war. Their efforts to elect peace candidates in the November 1966 elections brought them into the movement and created valuable local networks of opposition to Johnson's policies abroad. Vestiges of the old labor-oriented left, like the Socialist Workers Party, joined the struggle. So did militant black activists, particularly associates of the Student Nonviolent Coordinating Committee (SNCC), who saw little justice in going to fight against dark-skinned people overseas when they, as black people, had so few rights at home. By the summer of 1966, they, like their white student counterparts, had endorsed draft resistance as a key strategy in the struggle to end the war. In this movement of movements, all avenues could lead to some form of opposition. The campaign against the war in Vietnam had room for Americans from all walks of life.

Building such a broad-based coalition allowed leaders to mobilize unprecedented numbers of people in protest. The spring 1966 International Days of Protest, for example, drew 200,000 people into the streets in demonstrations across the nation. One year later, over 300,000 rallied in New York and San Francisco to pressure Johnson to end the war. When 100,000 people gathered in Washington, D.C., in an October 1967 March on the Pentagon, nobody blinked—except for the government, who called out federal troops to protect the capital city from protesting citizens. As the numbers suggest, opposition to the war was widespread and growing.

Sustaining a united front, however, was not as easy as the massive numbers of protesters suggest. By late 1967, the antiwar movement was more like a many-headed hydra than a unified and coordinated campaign. Rising frustration over Johnson's continued escalation of the war led to serious tension within the movement. So did the irony that, no matter how many demonstrations people organized, and no matter how large the crowds, how varied their membership, or how militant their actions, the war continued unabated. Divided by constituency, locality, and ideology, activists increasingly found little they could agree on except for their common desire to end the war in Vietnam. Liberal peace advocates, who believed that the only way to end the war was to work through existing political channels, had little to say to radicals who shunned the Democratic Party and called instead for revolution and confrontation. Local activists often found themselves at odds with organizers in the national offices. And pacifists, who had hoped to lead a Gandhian-styled antiwar campaign, instead had to struggle to keep nonviolence in the forefront of the movement's tactics. It proved difficult, at best, to build solid alliances between those who believed that the war was just an aberration, a mistake in an otherwise acceptable political system, and those who believed that the war grew out of the unjust distribution of power that defined American politics and life.

Johnson's Electoral Challenge

The tensions became particularly clear in late 1967 and 1968. That fall, Minnesota senator Eugene Mc-

Carthy rose to challenge President Johnson for the Democratic Party's presidential nomination. The liberal contingent of antiwar protesters rushed to his support. Idealistic young college students shed the "hippie" image, cut their hair, and operated phone lines, ran off press releases, and canvassed door-to-door as part of the "Clean for Gene" brigade. This grassroots effort at democracy-in-action celebrated in March 1968, when McCarthy won over 40 percent of the vote in the New Hampshire primary in a surprising show of popular support. McCarthy's victory paved the way for Senator Robert Kennedy's entry into the presidential contest—now bringing two critics of Johnson's war to the center of Democratic Party politics. Johnson, aware that popular sentiment was running strongly against him, decided not to run again. His surprise announcement on March 31st seemed proof that liberal reform efforts could affect the outcome of the war.

This apparent liberal success, however, came in the wake of a rising tide of violence that brought the radical vision of social change to the forefront of the antiwar struggle. The January 1968 Tet Offensive, when North and South Vietnamese rebel forces attacked American military strongholds in South Vietnam, shocked an American public that had been told by government officials that the end of the war was near. Then the bloodshed and fire came home. On April 4, Martin Luther King Jr. was assassinated in Memphis, Tennessee, setting off a wave of urban riots that left major cities, including Washington, D.C., in flames and convincing many that the age of nonviolent protest had come to an end. That May, a small group of Catholic laity and clergy, known as the Catonsville Nine, raided a Maryland draft board and incinerated the records with a homemade recipe for napalm, the jellied gasoline mixture that U.S. forces were dropping on civilians in Vietnam. Although many antiwar advocates shunned this public destruction of government property, the poet and priest Daniel Berrigan, one of the Nine, insisted that it was better to burn paper than children. Given the intransigence of federal government policies, he and his supporters believed that there were few choices left besides the most militant of actions.

The visibility of such radicalism only increased as the viability of liberal dissent seemed to shrink. Demonstrations, some turning violent, rocked college campuses that spring of 1968. Then, in June, Robert Kennedy was assassinated in front of a crowd of supporters. Along with King, Kennedy had marked the last of the great liberal hopes. Now all such hope seemed dead. The rioting and police assault on demonstrators outside that August's Chicago Democratic National Convention, and the selection of Johnson's designate, Hubert Humphrey, as the party's presidential nominee, highlighted the obstacles that antiwar forces faced as they tried to make themselves heard. But it was the Chicago street actions, not Democratic Party machinations, that captured the public's attention. Rather than garnering sympathy and support for the movement, television images of militant protesters battling police raised the ire of the general public, who increasingly saw these demonstrations as a dangerous and disruptive force. Although growing numbers of Americans opposed the conduct of the war, in the battle for public opinion, the antiwar movement found itself on the losing end. As the movement became more and more associated with its radical wing, Americans came to hate antiwar protesters as much as they hated the war.

Wracked by internal dissension and external opposition, about all that kept the antiwar forces of the late 1960s together and moving was Washington's continued prosecution of the war. The imperative for action was constant. Republican Richard Nixon came to the presidency on a platform of "Peace with Honor." But when he unveiled his peace plans in May 1969, activists recognized that his peace required continued military support for South Vietnam and quickly mobilized in protest. That fall, the movement staged two of its largest and most impressive demonstrations. The first, the Moratorium, drew from the grassroots organizing experience of antiwar liberals and Democrats involved in the 1968 presidential campaign. On October 15, over a quarter of a million Americans—students, workers, housewives, and politicians—removed themselves from their day-to-day responsibilities and gathered in their cities and hometowns to express their desire to end the war. A month later, a coalition on the left organized the fall Mobilization, attracting more than 800,000 people in two large protests in San Francisco and Washington, D.C. The Mobilization's high point came during the thirty-eight-hour "March Against Death," where a seemingly endless line of participants, each carrying a placard with the name of an American killed in Vietnam, marched from Arlington Cemetery to the White House and placed the placards, one by one, into a series of wooden coffins. The success of these protests belied the disarray that was ravaging the movement. Nevertheless, when Nixon announced the U.S. invasion of Cambodia in late April 1970, the movement rallied in a spontaneous wave of protest.

These demonstrations were, more than anything, displays of reaction rather than proactive programs of organized political dissent, but there was no doubt that they were spreading. The May protests, for example, arose specifically in response to the Cambodia invasion. When they ended in tragedy on May 4 at Kent State University and two days later at Jackson State, after the National Guard and local police shot into crowds of unarmed students, college campuses rose up in revolt. Spontaneous student strikes shut down almost 500 colleges and universities. Veterans similarly began to organize, coming together as Vietnam Veterans Against the War in public demonstrations that stunned the nation and infuriated the president. With each escalation of the war, the protest movement escalated as well. But it was a movement held together by little more than a shared disgust with the war.

McGovern's Campaign to End the War

Protests persisted through the early 1970s, and although militant demonstrations still stood at the center of media coverage of the movement, liberals had actually started to make significant gains. Efforts at education, lobbying, and outreach had begun to influence the contours of congressional political debate. In 1972, Democratic presidential candidate George McGovern openly stated his plans to withdraw U.S. forces from Vietnam. By the time an agreement was reached on the Paris Peace Accords in January 1973, organizers representing the liberal wing of the movement had forged the strongest antiwar coalition ever, gaining support from McGovern's campaign, the labor movement, and traditional pacifist stalwarts like SANE, WILPF, and the AFSC.

It was this last core of pacifists who once again led the struggle in the years between the signing of the peace agreement and the actual end of fighting in Vietnam in 1975. Historians Charles DeBenedetti and Charles Chatfield describe the movement as, over the course of a long decade, having come full circle. What was a peace movement in 1963 was subsumed by 1965 into a larger, but more narrowly defined, antiwar struggle. A decade later, nonpacifist leftists, liberals, and civil rights advocates—the bulk of the movement's constituency—had fallen away, returning to the demands of their daily lives or to other struggles for social and political change. As a result, the antiwar movement reverted to its pacifist roots. But this was not the same pacifist movement that had inaugurated early protests against the Vietnam War. Antiwar coalitions had brought pacifists in touch with activists working on a variety of other concerns and had helped forge vital links between the peace movement and the broader struggles for social change. Pacifist leadership had also been transformed. A younger, experienced, and more radicalized generation now stood at the helm. Skeptical of liberal politics and governmental affairs, they displayed attitudes that reflected the growing cynicism of post-Watergate American life. Nevertheless, the peace activists of the mid-1970s remained a highly empowered group, committed to nonviolence and convinced that citizens had the power to promote change and resist war.

The Antiwar Movement: From Vietnam to the New World Order

In the decades since the end of the Vietnam War, the antiwar movement has had to adjust to dramatic changes in political climate, the global balance of power, and its place in domestic debates over violence and war. Although the movement shrank significantly after 1973, it rallied with an impressive show of strength in the early 1980s. Since then it has struggled to retain influence and support while advancing a nonviolent vision of social and political change.

One theme that continued unchanged from the Vietnam War years was opposition to U.S. military intervention overseas. Activists got an early taste of things to come in 1973, when a U.S.-sponsored military coup toppled the popularly elected Socialist government of Chile. By the late 1970s, the United States was actively working to undermine revolutionary movements in Guatemala, El Salvador, and Nicaragua. Peace advocates sided with the popular insurgent movements, arguing that they comprised the strongest voices for democracy and reform, and that the American government was supporting repressive military regimes under the guise of Cold War conflicts. Acting in solidarity with the people of Central America, peace activists staged vocal demonstrations, waged outreach and educational campaigns, lobbied Congress to cut off funding for military aid, and enlisted help from a wide range of liberal, radical, and religious groups. In all of these efforts, antiwar "veterans" of the Vietnam era shared their experience and knowledge with a new generation of activist volunteers as they struggled to maintain the movement's vital edge.

Opposition to Nuclear Weapons

The peace movement's other main focus in the 1970s and 1980s was the revived struggle against nuclear weapons. Even in the midst of the Vietnam War, SANE had not entirely abandoned its goal of ending the nuclear arms race. In 1969, it spearheaded an effective coalition effort to halt the development of antiballistic missiles (ABM), and in 1972 it played a key role, along with the AFSC and CALC, in the successful campaign against the B-1 bomber. These efforts were augmented by the contributions made by radical direct actionists to the antinuclear power crusades that swept the nation with mass demonstrations, and thousands of civil disobedience arrests, in the middle and late 1970s.

This combination of radical and liberal activism laid the foundation for the mass movement against nuclear weapons that emerged in 1979. The Nuclear Freeze campaign built on the mainstream political efforts of SANE and the AFSC. Its goal was limited and, activists believed, achievable: a bilateral and comprehensive freeze on the development and deployment of nuclear weapons. As with the test-ban advocates of the late 1950s, Freeze organizers saw their campaign as the first step toward a nuclear-free future. Designed as a grassroots effort that placed Nuclear Freeze referendums on state and local ballots and that put political pressure on elected officials, the campaign attracted widespread support and mobilized hundreds of thousands of citizens on its behalf. The radical wing of the peace movement, however, like its counterpart from the ban-the-bomb days, called for unilateral disarmament and shunned electoral campaigns. In cities from Minneapolis to Las Vegas to New York, radical grassroots organizers mobilized thousands of citizens to sit in at local munitions makers and military sites. Expanding the boundaries of protest even further, the priest brothers Daniel and Philip Berrigan catalyzed Catholic resistance to the bomb by hammering on nuclear warheads, sparking a series of direct disarmament actions known as the Plowshares movement. The women's movement also joined forces with the antinuclear crusade when, in solidarity with feminist antinuclear efforts in England, it organized a peace camp at the Seneca Army Depot in upstate New York.

Encompassing both the center and left wings of American politics, the antinuclear weapons movement grew at a dramatic pace that ultimately proved difficult to sustain. In June 1982, only three years after the founding of the Freeze, a New York City rally held in conjunction with the United Nations' Second Special Session on Disarmament attracted nearly one million people, making it the largest protest demonstration in American history. Two days later, in a coordinated gesture, over 1,600 protesters risked arrest by committing civil disobedience at the consulates of the world's nuclear powers. This dramatic showing, however, marked the movement's peak. By the mid-1980s, with few legislative victories and no treaties to show for its efforts, the movement to stop the arms race had shrunk down to a declining core of dedicated activists. Activism continued, albeit in a muted, diminished, and increasingly marginalized form.

The Persian Gulf War

The antiwar movement persisted in its reduced state through the late 1980s and into the 1990s, when world events rearranged the global dynamics of power and forced peace advocates to adjust their priorities and goals. The first indication that things had changed came in 1991 with the Persian Gulf War. The United States' military conflict with Iraq was qualitatively different from its military engagements of the Cold War years. Protests broke out against what activists described as the unilateral use of U.S. power in the world, with demonstrations that attracted tens of thousands of supporters in the days before the January 1991 declaration of war. It seemed, for a moment, as if the peace movement had been reborn. But once the war began, the tide of public opinion turned. In the new age of conservatism, the tolerance for dissent had dramatically diminished. Pundits described the Gulf War as the nation's remedy for its humiliation in Vietnam and as a preview of the United States' role in what President George H. W. Bush called "the new world order." The media, which no longer considered peace activism a newsworthy item, kept the voices of protest out of the news and isolated from one another. Only the most dedicated activists maintained their involvement through small local vigils, newsletters, and occasional civil disobedience protests. The movement now focused on constraining the U.S. military as much as possible. But with limited public support, such efforts became symbolic at best.

Stymied by the overt celebration of militarism that arose in the wake of the Persian Gulf War, antiwar advocates also had to confront the new world order that arose in late 1991 with the collapse of the Soviet Union and the subsequent end of the Cold War. Although some peace leaders talked of the possibility of a "peace dividend" that would be redistributed out of money saved from reduced military expenditures,

no such bonanza appeared. Nor did the nuclear arms race come to an end, despite a number of highly publicized arms limitations treaties. Instead, the United States was left as the sole global superpower, with no clear sense of its new role in the world, but intent on preserving its dominant global position. Peace activists grew increasingly concerned about the unilateral use of U.S. military power and the continued threat of nuclear proliferation but remained unsure about how to organize and around what issues to take a stand.

In the decade that followed the first Gulf War, the American peace movement focused on advancing a multifaceted vision of a world without violence and war. Groups like the War Resisters League and WILPF joined the anti-globalization protests of the early twenty-first century, lending their expertise as organizers and publicists, as well as working to keep the tradition of nonviolent activism alive. Numerous activists similarly continued their work for social justice, tackling issues as diverse as the death penalty, homelessness, inner-city poverty, racism, and environmental abuse, alongside their work for peace.

The terrorist attacks of September 11, 2001, which killed thousands of Americans in New York City, the Pentagon, and on United Airlines Flight 93, which crashed in Pennsylvania, brought a new sense of urgency to these efforts. Fearing that the War on Terror would lead to civil liberties abuses at home, racial discrimination against Arab immigrants, and military actions abroad, antiwar groups mobilized to prevent new national and international crises. Their voices of dissent received little public or media attention in the year that followed the tragedy of 9/11. But by the winter of 2003, in the face of an impending U.S. war against Iraq, it became impossible to ignore their presence on the political stage. Organized under the auspices of established pacifist groups, as well as new broad-based coalitions like United for Peace, which brought together a wide array of labor, racial justice, anti-globalization, feminist, and faith-based activists, the antiwar movement staged a resurgence in numbers not seen since the days of the Vietnam War. Their efforts culminated in a dramatic weekend of protests in February 2003, when a coordinated series of marches and demonstrations brought more than 10 million people out onto the streets in over 600 cities across the globe. From New York to London to Rome, Istanbul, Australia, and Brazil, citizens of the world said "No" to war. Despite this unprecedented display of opposition to war, the national and international antiwar movement failed to prevent the U.S.-led attack and occupation of Iraq that began in March 2003. Nevertheless, the movement had shown its ability to mobilize a vast and diverse constituency of protest.

In the wake of U.S. military operations in Iraq, and the United States' shift to what many observers describe as a "permanent war mode," peace and antiwar activists are now struggling to marshal the energy of the winter's mobilizations and turn it into a sustained and organized movement against violence, injustice, and war. This will not be an easy task. Despite their recent organizing successes, the activists of 2003, pacifist and non-pacifist alike, have few illusions about their political strength. They recognize that their most pressing challenges are to persist, to make their voices heard, and to broaden and deepen their bases of support as they continue their critique of U.S. military policies and the impact of these policies on people's lives at home and abroad.

Anti-Preparedness Movement

Anti-preparedness can be defined simply as the movement against U.S. military preparation before its official entry into World War I. Its roots lay in two closely related national debates about the role and nature of the United States. As the crisis in Cuba during the 1890s grew more serious and voices were raised in the United States for action against Spain, the power governing Cuba, a lively public argument broke out for and against war. Anti-imperialists insisted that the democratic tradition of the United States demanded no foreign wars for the creation of an American Empire. They argued that an empire would necessarily destroy democracy. On the other side, Imperialists like Admiral Alfred T. Mahan and Assistant Secretary of the Navy Theodore Roosevelt (later governor of New York and president of the United States) argued that the United States had earned the right to be a world-class power. The currency of power was a strong military and imperial acquisitions. No clear-cut victory was had by either group, despite the United States' acquisition of the Philippines and Puerto Rico, and the financial guardianship exercised over Cuba as a result of the Platt Amendment.

A second debate was literally fought out inside the United States over the nature of the country. Large corporations came to dominate the American economy in the 1890s and beyond, while citizens, notably workers faced with enormous corporate power, fought to uphold what they considered their individual democratic rights as laid out in the Declaration of Independence and the Bill of Rights in the face of corporate power. Neither of these public debates was resolved when war was declared in Europe in August 1914. Indeed, strife had reached such a level between workers and bosses that it truly became "class warfare" across the nation. So serious was it that a presidential committee, the U.S. Commission on Industrial Relations, conducted hearings from 1913 through 1914 to investigate causes and remedies.

From mid-1914, businessmen such as J.P. Morgan and others who had lost monies since the beginning of hostilities in Europe joined forces with politicians like ex-President Theodore Roosevelt in an attempt to protect their interests. Although Roosevelt and Senator Henry Cabot Lodge (R-MA) championed the idea of protecting America's vital interests rather than business profitability, they eagerly accepted business support. The preparedness faction believed that President Woodrow Wilson had a moral obligation to increase military preparedness. Oddly enough, the first anti-preparedness advocate was President Wilson. In speeches during 1914, a midterm election year, he consistently advocated that the cost of building the military which his opponents wanted would draw America into the European conflict that had nothing to do with the United States, and so the nation would be forced to choose sides. If the United States became involved, according to Wilson, it would lose the status of friendship with some European nations and it would no longer be a disinterested party in their conflict.

In reality, Wilson believed that the war would change global structures both politically and economically, but his reasons for remaining on the sidelines in 1914 were based on domestic American politics. The United States in 1914 was in many aspects a nation of immigrants. In most major cities, anywhere between 60 percent and 85 percent of inhabitants were either foreign-born themselves or had at least one parent born abroad. The majority of first-generation immigrants in that year were from central, southern, and eastern European countries where the war had broken out and raged. President Wilson had little desire to confront the issues surrounding immigrant loyalty to America at that juncture. He recognized that it would be a long process to create the atmosphere necessary

to have the loyalty of these new immigrants tested on a battlefield in a country in which they still had relatives. He also knew that the majority of Americans were not in favor of creating a large military for two reasons. First were the budget constraints that military preparedness would place on domestic programs, along with a tax increase to fund military spending. The second was that most Americans associated a large military with European despotism and a threat to democratic principles. Beyond the domestic reasons, Wilson used the political reality of 1914 to back his anti-preparedness stance. Democrats in Congress would never vote for military programs over domestic spending, and most conservative Republicans and Progressives agreed. Along with most of the world, Congress believed that this was going to be a short war and it need not impinge on America. In 1914, using the principles that most Americans held, Wilson easily quieted the preparedness voices in America.

A dramatic change in attitude took place within the administration the following year, though it was not expressed publicly. Germany's use of submarines and attacks on American vessels raised some eyebrows and brought questioning from the press, but the majority of Americans still perceived the threat of war to be a European problem. The sinking of the ocean liner *Lusitania* in May, with the loss, among many others, of 128 American citizens, created public outrage that the war was no longer confined to the Europeans. Still, the American public was unwilling to go to war. By late 1915, the British and French governments were out of money. J.P. Morgan, as their representative in the United States, had trouble floating loans to continue their war effort. Aware that the war was inevitable given the situation in Europe with both sides deadlocked, Wilson began the process of preparing the nation to fight. When the politicians ignored Wilson's preparedness program presented to Congress in 1915, the president had to take action himself. He made a series of speeches during the second half of the year emphasizing that there were many Americans who held "alien sympathies"—a direct attack on immigrants with radical political beliefs. He also made references to labor unions which he believed were centers for immigrant radicals who advocated undermining the government. The most radical union of the day was the Industrial Workers of the World (IWW). Wilson believed and advocated that these organizations of workers were an actual threat to the nation.

In 1916, Wilson ran for reelection. He used the rhetoric of "Americanism" and patriotism during the campaign in the face of criticism by Roosevelt, Lodge, and others who advocated that the time had come to support the Allies in Europe. Behind the scenes, Wilson worked with the Democrats in Congress to change the long-held antiwar stance of the party. During the Democratic Party Convention and on the campaign trail, he talked of "negotiated peace" in Europe and observed that the United States recognized the rights to self-determination and freedom from aggression for all nations. Wilson also spoke out against the anti-preparedness forces in America, stating that they did not have loyalty to the country. He used the term *disloyalty* to characterize any individual or group that expressed a negative opinion of his leadership. Wilson employed ethnicity as a device to demonstrate the differences between loyal Americans and the disloyal. This type of rhetoric served to increase the anger of unions such as the IWW which believed that American entrance into the war would be an excuse to smash labor unions and give industry a free hand against labor. When the election took place in November, Wilson won by a very narrow margin due to his antiwar stance. The Socialist Party, which had great success in the 1912 election, did not have a large following during the 1916 election because Eugene Debs, the living embodiment of the Socialist Party, refused to run because of ill health. Socialists, radical labor, and political groups largely voted for Wilson because he promised to keep them out of the war.

During the campaign, Wilson had claimed that war was the opposite of peace, while gently nudging the nation toward a more warlike stance through events such as preparedness parades in major cities around the country.

The city of San Francisco was the site of a huge Preparedness Day parade on July 22, 1916. Its purpose was to demonstrate support for the Allies and promote patriotism. More accurately, what actually happened in San Francisco reflected a conflict between conservatives and radicals. The Preparedness Day parade became a focus of the ongoing struggle in the city between workers and management, a microcosm of the national situation. The San Francisco Central Labor Council and the Building Trades Council actively opposed worker participation in this demonstration of patriotism, while city employers de-

manded that their employees take part or be replaced. The radicals set up an anti-preparedness demonstration at Dreamland Rink, a city park, for the evening of the same day.

For workers and radicals, opposition to the preparedness parades was relatively straightforward. They believed preparedness to be a cynical maneuver by big business to hijack patriotism and the nation for their own selfish ends, to crush unionism and worker rights, and to profit from death and injury in war. In San Francisco, such an attitude appeared amply proven by the fact that the Preparedness Day parade was organized by the Chamber of Commerce, an organization dominated by large businesses like Pacific Gas & Electric and United Railways. These businesses had raised $1 million earlier in the year and had revived the city's vigilante heritage with the formation of its Law and Order Committee, the specified goal of both being to rid the city of labor unions. Although the bulk of the energy behind the anti-preparedness movement came from radicals and militant labor, it was also supported by many immigrant and ethnic Americans, especially those who were first-generation Americans, and by veterans of the anti-imperialist and clean government movements of recent history. In San Francisco, these latter people were represented at the Dreamland meeting in speeches by Rudolf Spreckels, a banker, and Fremont Older, publisher of the *San Francisco Bulletin*. Anti-preparedness was a powerful expression of what was believed at root to be a contest between workers and management thinly disguised in Americanism.

The Preparedness Day parade itself went ahead, with thousands of marchers participating more to protect their jobs than through enthusiasm for the cause and thousands also who truly believed in its worth. Rapidly, however, it turned to tragedy. A bomb exploded, killing ten and wounding scores of others. Immediately, five militant city labor unionists were arrested. They included two men later famous as the centerpiece of international campaigns for their release, Warren Billings and Tom Mooney. Radicalism in America was blamed, and the San Francisco Preparedness Day bombing fed into a growing move to tar all dissent in the nation as unpatriotic and anarchistic. Anti-preparedness as a movement was transformed into a series of defense campaigns against government suppression of free speech.

In other cities where preparedness parades were held in 1916, as in Chicago, anti-preparedness demonstrations were held. The following year, as the United States moved ever closer to war, significant labor groups like the Chicago Central Labor Council and the United Hebrew Trades, developed their anti-preparedness and labor defense campaigns, giving large rallies and money to denounce the government and employers' drive to war.

During the first months of 1917, it became apparent from the division within the country over the issue of preparedness and the increasing strength of radical labor and political movements that Wilson had not managed to bring the country to a consensus over the war. The anti-preparedness campaign continued with publication of articles in Socialist, radical, and labor journals, such as the IWW's *Solidarity*, the Socialist New York *Call*, and the Anarchist *Mother Earth*. Rallies were held, keeping the momentum of the movement high. Congress passed a series of laws early in the year dealing with patriotism issues.

First, it passed a law restricting incoming immigrants to those who were literate and to deport those who held political beliefs contrary to the majority in the nation. During the following month, it passed legislation outlawing any bodily threats to the president. Congress outlawed the publication of information that could undermine the success of the U.S. military during war. Although the United States did not declare war on Germany until April 6, 1917, the pieces of legislation passed during this winter session were all aimed at the radicals and labor affiliates.

In March, when the state of Idaho passed a law that banned the IWW from any action in labor negotiations that could be determined as unlawful, the anti-preparedness movement gained strength. The fear was that the Idaho legislation would be the beginning of a national ban on labor negotiations, with claims that the unions were using unlawful means to obtain a contract to the workers' advantage. The federal Justice Department started compiling lists of radicals and union members whom they believed to be alien and disloyal to American interests. Nonetheless, the anti-preparedness forces continued to publish articles and speak out against the government, recognizing that arrest and deportation could be imminent.

The declaration of America's entry into World War I in April 1917 signaled the end of the anti-preparedness campaign. It was replaced by anti-

conscription campaigns. The laws enacted to stop dissent during the preparedness phase of America's involvement with the war were now turned against those who continued to advocate against involvement. For the radicals and labor leaders there was a new fear. They believed that the government was willing to suspend civil liberties and the right to free speech during war. Time would prove their fears justified.

Antiwar Movement: World War I

American opposition to World War I came primarily from two wings of the peace movement—internationalists and liberal reformers—and developed in two distinct phases—before and after the United States entered the war in April 1917. Internationalist peace organizations worked within the framework of established global political power structures to develop international organizations, arbitration, and laws for securing and maintaining peace without trying to produce fundamental social and economic change. Liberal reformers were composed of a coalition of feminists, social workers, labor lawyers, publicists, journalists, clergy members, and others who formulated their own peace organizations or integrated antiwar efforts within their other progressive causes. Unlike the internationalists, they closely connected the achievement and maintenance of peace with substantial political, social, and economic reform. Before the United States entered the war, the peace movement captured a degree of sympathy from the general public, for many Americans initially wanted their country to stay out of what they saw as a strictly European conflict. The opposition movement against the war collapsed when the United States declared war on Germany on April 6, 1917, as it quickly became unacceptable to publicly voice opposition to the country's war effort. Most peace organizations disbanded, became defunct, or shifted their stance to support the war effort, focusing instead on gaining a quick and equitable peace.

Internationalists

Most internationalist peace organizations started in the first decade and a half of the twentieth century. Increased involvement in the foreign arena tangibly launched the United States as an emerging imperial power. U.S. participation in international affairs—notably the Spanish-American War and the costly Russo-Japanese War—spurred pacifist interest in constructing systems to maintain peace between nations that possessed increasingly powerful armed forces. These circumstances helped peace societies to dramatically increase their membership and influence. No doubt, however, the pacifist movements were slow to develop. The American Peace Society, for example—the largest American peace organization in 1900—grew from a small local society in Boston. The nascent expansion of the United States as an international power led to the rapid growth of the organization. By 1907, the American Peace Society expanded to nine chapters, and by 1914, the organization grew in stature to become a bona fide national organization with thirty-one chapters across the country.

During these prewar years, a range of peace advocates emerged to cut across the political spectrum, ranging from internationalists like the American Society of International Law to feminist Jane Addams to Socialists. However, the internationalists certainly had the most influence, power, and momentum of all peace activists. From 1901 to 1914, Americans formed forty-five new peace organizations. Among the most influential of these were the American Society of International Law, the American Peace Society, and the World Peace Foundation. These groups drew the support and participation of elite men like Andrew Carnegie and Elihu Root. In fact, Carnegie established the Carnegie Endowment for International Peace in 1911, which subsidized many of the pacifist organizations and provided the opportunity to engage directly with diplomats and state leaders, often at international conferences and closed meetings. Pacifists typically did not work in public forums or try to gain popular support through rallies and other events, practices pursued by liberal reformers.

In the years before World War I, internationalists tried to maintain peace by setting up a network of global organizations, laws, courts, and conferences providing nations with a framework through which

On August 29, 1914—twenty-six days after the onset of World War I—some 1,500 women conducted a silent peace march down Fifth Avenue in New York City. They favored keeping the United States out of the war. *(Brown Brothers)*

they could peacefully resolve conflicts through negotiation, arbitration, and legal hearings. This approach to promoting peace conflicted with the European system of maintaining a careful balance of power among nations and also required that Americans abandon their hope that isolationism would protect the United States from armed conflict. Two significant examples of peace activist work include participation in the First and Second Hague Peace Conferences in 1899 and 1907. The 1899 conference developed some rules of war and established the permanent Court of Arbitration. The second conference expanded on the war conventions, particularly on rules of neutrality. The work of many internationalist peace advocates before and during World War I laid the conceptual groundwork for the League of Nations and ultimately the United Nations. The League to Enforce Peace, for example, was founded during the war for the primary goal of promoting a postwar international organization.

Differences within the ranks of the internationalist peace movement focused on the degree to which nations should surrender their sovereignty to an international system of institutions and laws. On the conservative end, some felt that a body of laws and rules of arbitration that nations agreed to would be sufficient to maintain peace without substantially impinging on a nation's sovereignty. On the liberal end of the scale, others felt the Western world required nations to give up part of their sovereignty—partic-

As World War I ravaged Europe, women played a major role in trying to end the hostilities. Pictured here is a delegation of the Women's International Committee for Permanent Peace. Jane Addams stands in the front row, second from the left, above the first "E" in "PEACE." *(© National Archives)*

ularly their ability to unilaterally engage another nation with force—in exchange for a collective security system to prevent armed conflict. Despite these differences, all internationalists worked with the assumption that structured international cooperation was needed at some level.

Internationalists maintained a noticeably conservative approach to advocating peace through working closely within the political establishment. They did not connect peace to social causes or class relations, and they did not look to address issues of inequality. The internationalists did not make their calls for peace on moral grounds but rather on practical arguments that modern armed forces made war economically and politically unfeasible. As America industrialized and expanded its global trade, they argued, international peace and stability became increasingly critical to the nation's economy.

The start of World War I in August 1914 seemed to leave many internationalist peace advocates in shock. In the war's first two years, most internationalists abandoned their antiwar stance and supported the Allied cause. The Carnegie Endowment for International Peace played a critical role in this shift as it used its financial power to convince a number of peace organizations to back the Allies. Internationalists justified this switch by arguing that Germany had to be defeated before any meaningful long-term peace could be established. In short, they took up a strategy of peace through victory.

The internationalists therefore turned their attention to securing a stable peace after the war. Their

most significant work toward this goal took place when members of the New York Peace Society and other conservative peace activists established the League to Enforce Peace in 1915. Their proposed league was a federation of nations that agreed to use force against any state that refused to submit to international law and arbitration. Under the leadership of former president William Howard Taft, the League to Enforce Peace gained an audience with President Woodrow Wilson in 1916. At that meeting Wilson did not directly endorse the group's proposals, but he did become the first head of state to publicly support a league or association of nations after the war. This marked one of the internationalists' biggest achievements during the war and indicated their focus was not on opposing the war but on developing a postwar peacekeeping infrastructure.

Liberal Reformers

A range of liberal activists from feminists to social workers to reform-minded clergymen along with many peace activists saw the reaction of the established peace societies as weak, timid, and ineffectual. Frustrated by what they saw as the peace societies' refusal to advocate for an immediate end to the war, many liberal reformers—including peace activists frustrated by their leaders—formed several new peace societies after the start of the war. These new organizations differed from the internationalists in that they were generally much more adamant in their demands that the war end immediately and that the United States stay out of the conflict. They also connected the war to many of the social ills affecting America and the world. Their calls for peace became part of their larger moral crusade for social justice and equity, while the internationalists made their calls for peace on the grounds that it was the key to political and economic stability. By 1916, the liberal reform wing of the peace movement had overshadowed the internationalist wing.

Feminist leaders were among the first to organize protests in the United States against the war and connect it to social and political inequalities. Less than a month after fighting started in Europe, leaders of various women's organizations and suffrage movements and independent feminists, such as Fanny Garrison Villard, organized a 1,500-person march in New York City protesting the war. Many of these leaders built on the success of that march to officially formulate in January 1915 the Woman's Peace Party a meeting in Washington, D.C., attended by 3,000 people. The party appointed Jane Addams—founder of Hull-House, social worker, and among the nation's leading feminists—as its chair. It became the premiere women's war opposition group in America, claiming 40,000 members in 1917 before the United States entered the war.

Like other reformers, women's groups tied their opposition to the war to their own causes, women's rights and, specifically, suffrage. Some felt that the war, which the general public associated with male bravery, strength, and courage, would emphasize the differences between the sexes at a time when feminists were trying to demonstrate and achieve their equality. Therefore, protesting the war was a necessary part of their feminist and suffrage work. Addams argued that their protest against the war was a natural extension of the work they had engaged in before 1914. Not only was their opposition to the war a politically necessary move, but it fit within their feminist philosophy and feminine role as well. Although fighting for gender equality, many women's rights activists still subscribed to the prevailing theory that women were more nurturing and sensitive than men and therefore better qualified and more naturally inclined to support peace. This view of women also made it socially acceptable for them to engage in peace activities, which in turn helped them become prominent players in the antiwar movement.

This view of women also gave the feminist peace activists the intellectual backing to argue that the male-dominated internationalist peace organizations were an integral part of the state system that caused the war in the first place. They felt that these groups had aimed too narrowly to only restrict war and not trying to achieve fundamental reform that would bring the world a lasting peace. The Woman's Peace Party and other women's organizations claimed that they were in a better position to gain this lasting peace because of their ability and feminine sensibilities. This position clearly put them at odds intellectually with the internationalists and firmly in the liberal reform wing of the peace movement.

During the first year and a half of the war, women's groups and other liberal peace organizations shared the internationalists' approach of using mediation between nations to achieve peace. Although the older, conservative peace societies looked to use mediation as part of an international structure to maintain peace after the Allies defeated the Central Powers, the newer, reform-minded peace organizations wanted to use mediation to end the war immediately. The International Congress of Women at The Hague and the Neutral Conference for Continuous

Mediation were prominent examples of efforts to mediate a quick end to the war. The International Congress of Women convened in April 1915. Presided over by Jane Addams and attended by American and European delegates, the congress called for an ongoing conference of neutral nations that would lead the negotiation of a peace settlement. The Conference for Continuous Mediation also met at The Hague later the same year. Beset with internal problems, the Conference managed to produce a peace proposal in 1916 that featured mediation. No state leader endorsed either proposal.

In 1916, peace activists began to shift their focus from international mediation to anti-preparedness in the United States. Before America entered the war, a public debate raged over how dramatically, if at all, the United States should increase its armed forces, particularly the Army. During the early years of the war, most Americans wanted to stay out of the conflict. In fact, in 1916 the nation reelected President Woodrow Wilson, who made his pledge to keep the nation out of the war a central tenet of his campaign. Even many preparedness supporters—those who argued that the United States should increase its armaments—wanted the country to stay off the battlefield. They felt that a strong military would prevent America from getting dragged into the war. Many peace activists believed, however, that strengthening the armed forces would do just the opposite. Opposing preparedness became one of the main goals of the liberal peace movement in late 1915 and throughout 1916.

A number of prominent liberal peace activists founded the American Union Against Militarism (AUAM) in November 1915. It quickly became the leading anti-preparedness organization in the country as it fought calls for a draft and increased military spending and became one of the most significant peace organizations of the war. The origins of the AUAM came from the Anti-Preparedness Committee, which was founded by reformers in New York. Within a year, it grew from fifteen to 15,000 members and transformed itself into the AUAM. The organization focused on lobbying and publicly arguing against other organizations that supported preparedness. In particular, the AUAM fought against conscription, dramatic military spending increases, and the Plattsburg movement that encouraged reserve officer training for civilians.

In 1916, the AUAM had striking success in preventing a major armed conflict between the United States and Mexico. While in pursuit of Francisco "Pancho" Villa and his irregular troops, who had killed several Americans in 1916, U.S. and regular Mexican army soldiers exchanged gunfire on June 21, 1916, which cost nine U.S. lives. Much of the press blamed the Mexicans for starting the incident and clamored for full-scale war. President Wilson came close to launching an invasion of the country. The AUAM immediately launched a publicity campaign to prove that the American troops were at least as much at fault as the Mexicans for the incident. The peace organization managed to turn the tide of public opinion, which quickly pressured Wilson to negotiate a settlement with Mexico. The AUAM helped facilitate those negotiations, and the two nations avoided war—although they remained wary of each other. It was a resounding success for the anti-preparedness organization and appeared to provide a model for keeping the United States out of the world war and resolving the horrific conflict. However, it proved infinitely more difficult to negotiate a resolution of the European conflict than the U.S.-Mexico dispute.

The United States Enters the War

Just as the start of the war in 1914 had stunned the older, established peace organizations, America's declaration of war on April 6, 1917, shocked the newer, progressive peace societies and threw them in disarray. Within a few months, most of the progressive peace organizations abandoned their antiwar stance and supported the American war effort. Coherent, organized opposition to the war began to fall apart at the beginning of 1917 with Germany declaring unrestricted U-boat warfare on January 31 and the United States breaking diplomatic relations on February 3. By the fall of that year, it became nearly impossible to make antiwar or anti-U.S. involvement statements without facing the active suppression and occasionally violent wrath of private citizens and public officials. President Wilson, who was sympathetic to the peace activists' cause and who received the support of most activists in the 1916 election, called antiwar efforts treasonous in June 1917. The government formed the Committee on Public Information that publicly hounded those who opposed the war. It also passed the Espionage Act in 1917 and the Sedition Act in 1918, which allowed the government to investigate, harass, and arrest individuals making any remotely antiwar statements.

In this difficult political climate which accepted little political dissension, most liberal peace activists gave their support to the nation's war effort. Only a small number of peace organizations and individual

"I DIDN'T RAISE MY BOY TO BE A SOLDIER"

In the early twentieth century, the United States was emerging as an imperial power, to the great dismay of many Americans who wanted the country to stay out of European wars. Much of the opposition to preparation for World War I was to emerge from pacifists, isolationists, Socialists, and Christian denominations. In 1915, "I Didn't Raise My Boy to Be a Soldier" became a popular antiwar song.

Ten million soldiers to the war have gone,
Who may never return again.
Ten million mothers' hearts must break,
For the ones who died in vain.
Head bowed down in sorrow in her lonely years,
I heard a mother murmur thro' her tears:

Chorus:
I didn't raise my boy to be a soldier,
I brought him up to be my pride and joy,
Who dares to put a musket on his shoulder,
To shoot some other mother's darling boy?
Let nations arbitrate their future troubles,
It's time to lay the sword and gun away,
There'd be no war today,
If mothers all would say,
I didn't raise my boy to be a soldier.

(Chorus)
What victory can cheer a mother's heart,
When she looks at her blighted home?
What victory can bring her back,
All she cared to call her own?
Let each mother answer in the year to be,
Remember that my boy belongs to me!

(Chorus)

activists remained openly opposed to the war, and most Americans viewed these remaining groups as radicals. They only shared their antiwar stance with individual conscientious objectors who refused to join the war effort because of their religious, philosophical, or political beliefs. Antiwar organizations either ceased operations, existed in name only, or shifted politically to the left as Socialists, radicals, far-left reformers, and members of the cultural avant-garde—among the few people to still oppose the war—filled the ranks of the depleted peace societies.

Peace activists who ultimately dropped their direct opposition to America's participation in the conflict exhibited varying degrees of support for the nation's war effort. At one end of the spectrum was Jane Addams who did not agree with America's involvement in the war but did support charities that tended to soldiers' needs. Nor did she directly try to obstruct the country's cause. At the other end of the spectrum was the Carnegie Endowment for International Peace, which offered its offices to the government's Committee on Public Information. Peace activists who actively supported the war effort saw the conflict as an opportunity to further their reform aims. Some felt that the war might weaken or even destroy some of the social, economic, and political structures that prevented reform. Others calculated that supporting the war would pay political dividends later. For example, the National American Woman Suffrage Association supported the war effort, and in 1918 President Wilson fully endorsed suffrage, claiming it was essential for the war effort.

The peace activists who became war supporters tried to direct the nation to pursue the war in a just manner and for a fair peace. Many formerly antiwar leaders continued with the work of the prewar internationalists to formulate an international structure to ensure a permanent peace. They also demanded that peace come quickly and that it be based on liberal principles and be fair and reasonable for all sides. In addition, they supported relief efforts for victims of the war in Europe. Peace activists—particularly from the liberal reform wing of the movement—focused on preserving freedoms and equality on the homefront. They argued that the nation's political process must be more representative to allow for a broader spectrum of people to be heard. They also demanded an equitable distribution of war costs in the light of widespread rumors of profiteering by industrialists.

In particular, these activists focused on defending individual liberties, especially the rights of dissenters and conscientious objectors. The National Civil Liberties Bureau—which later became the American Civil Liberties Union (ACLU)—of the AUAM led this defense of civil liberties. AUAM members founded the Bureau as part of the original organization after the United States entered the war. By October 1917, the Bureau became an independent entity and was boldly defending the rights of those who objected to the war.

The formation of the National Civil Liberties Bureau signaled the demise of the AUAM and symbol-

ized the internal division that struck many peace organizations in 1917 and 1918. Moderate members left the organization—including one of the founders, Paul Kellogg—when the majority of the AUAM decided to start the Civil Liberties Bureau. Kellogg and others felt that its work to defend conscientious objectors and war dissenters radicalized the AUAM. The remaining members merged with antiwar Socialists and the Emergency Peace Federation to form the People's Council of America for Peace and Democracy, which campaigned for a quick peace settlement, a repeal of conscription, and civil liberties. It steadfastly opposed the war and urged workers in America not to support the war effort. Not surprisingly, a number of federal and local authorities hounded the People's Council throughout the war.

What happened to the AUAM illustrated a pattern throughout the peace movement of moderate activists becoming, at least passive, supporters of America's military campaign. They often left their antiwar organizations or transformed them into war-supporting entities. Meanwhile, those that remained steadfast against the war either took over the peace organizations or started new ones. The composition of the remaining antiwar movement slid to the left as Socialists, members of the Industrial Workers of the World, and radicals replaced liberal reformers who generally worked within the nation's capitalist framework.

The liberal reformers who backed the war had hoped that they would be able to influence how the nation pursued its war aims—defending civil liberties at the home front and ensuring a fair and lasting peace abroad. Their vision of how the United States should conduct the war never materialized. The world war turned out to be one of the worst periods for civil liberties in American history, and the punitive terms of the Treaty of Versailles were obviously disappointing to them. On the other hand, stalwart antiwar activists and political radicals accused these liberal reformers of having no principles because they bowed to societal pressure to support the war. The bitterest criticism of the liberal reformers came from Randolph Bourne, a young intellectual. Bourne claimed that these new war-supporters had sold out their principles for mere expediency. He also rhetorically asked, if the peace activists could not prevent the war, how could they manage it in a way that would produce the reforms they wanted?

The number of conscientious objectors was very small, but they were among the most steadfast opponents to the war. They were not an organized group but rather individual men who refused to fight in the war. The Selective Service Act allowed people from generally recognized religious sects whose religious beliefs prevented them from fighting to claim an exemption from combat duty. This narrow standard excluded people who did not belong to a well-known sect or who objected to fighting on political or philosophical grounds. Local draft boards were primarily responsible for deciding who was eligible for an exemption, and the criteria for making these decisions varied widely from board to board. The claims of an untold number of men for conscientious objector status were turned down.

By the end of the war, the army had officially drafted just under 4,000 conscientious objectors. Approximately 2,600 of them had been assigned to either noncombatant roles in the army or had been furloughed out of the army with assignments for industrial, agricultural, or reconstruction work. At war's end, the army had just over 200 conscientious objectors whom it had not assigned to alternative service. The army court-martialed and imprisoned 450 objectors on whom it did not bestow official conscientious status. Another fifty men were also court-martialed but quickly released. Just over 700 absolutist objectors were in military camps but refused to engage in noncombatant duty because they believed that even this service would help conduct a war they fervently opposed. In comparison, local draft boards had given almost 21,000 men noncombatant status for a variety of other reasons, and an estimated 171,000 people simply evaded the draft.

Most people were conscientious objectors—or at least tried to claim this status—because of either political or philosophical principles, their literal belief in scripture, or a combination of religious, philosophical, and humanitarian beliefs. Of the officially recognized—hence, religious conscientious objectors—half were Mennonites and one-quarter belonged to pacifist sects. Nearly all of the religious objectors had a literal understanding of the Bible.

Several religious denominations, especially the Quakers, Mennonites, and Brethren, organized efforts to try to ensure the civil rights of conscientious objectors, prevent their mistreatment in army camps, and provide any financial assistance they might have needed. Most pacifist churches, such as the Mennonites and the Quakers, held fast to their antiwar beliefs after the United States entered the war. Although these churches were opposed to the war, many felt a moral obligation to provide assistance to those left destitute by the conflict. Members of the Mennonites and Brethren, for example, worked through public charity organizations or founded their own groups, such as the Friends Service Committee. These churches made their sense of obligation to help those hurt by the war an integral part of their antiwar beliefs.

Conclusion

The start of World War I facilitated the emergence of a new generation of peace activists who opposed U.S. involvement while advocating a swift and just peace. Most new peace advocates were liberal reformers. Among other groups, leading figures included labor leaders, social workers, feminists, journalists and writers, and Social Gospel clergy who associated their opposition to the war to their ongoing reform work. As the war continued, liberal reformers became more influential than internationalist peace advocates who, since the end of the nineteenth century, had worked to develop an international system of courts, laws, and arbitration to prevent armed conflict between nations. America's entry into the European conflict in 1917 created disarray in the antiwar movement as many peace activists supported the nation's war effort and a fair and equitable peace while also trying to protect the rights and civil liberties of Americans who still opposed the war. Only a small number of peace organizations maintained a principled antiwar stance, moving to the political left—since only radicals, So-

cialists, and those with an unwavering commitment to opposition to the war or the government's policies remained to fill the breach. These enduring antiwar organizations only shared this stance with individual conscientious objectors and pacifist religious sects.

World War I and Civil Liberties

The definition of civil liberties in America has changed over time. Civil liberties consist of the first ten amendments of the Constitution, known as the Bill of Rights, and natural rights that have been deemed as individual rights after a prolonged period of usage. Civil liberties occur only in democracies; the Founding Fathers believed that inclusion of the Bill of Rights in the Constitution would protect the individual from encroachments by the state. Changes that occurred during the Progressive Era and World War I significantly altered the way in which the Bill of Rights was interpreted. During this time frame, civil liberties were no longer an abstract question with little case law to make them a reality. In the early years of the twentieth century, the rights of the individual came face to face with the needs of the state as expressed through the leaders of the nation.

America's entrance into World War I on April 6, 1917, was preceded by months in which the legislative branch of government had passed a series of laws that diminished the rights of the individual. Many of the laws passed between mid-1915 and American entrance into the war dealt with the need of the state to prepare for war and to isolate those who voiced dissent against war preparations. Because of the ethnic composition of the immigrants who arrived on American shores during the late nineteenth and early twentieth centuries and the fact that their homelands were now at war, Woodrow Wilson's administration worried over the issue of immigrant loyalty to the United States. The president wanted the support of the whole nation if and when the country declared war against Germany. The other group that presented the Wilson administration with problems over the issue of war was the radicals. Many of the radical labor and political movements of this time were composed of first- and second-generation immigrants. Wilson's administration believed that dissent from the radicals would lead to a groundswell of antigovernment feelings within the nation. During the early months of 1917, the legislators prepared the groundwork for the curtailing of civil rights through legislation pertaining to the immigration of radicals and protection of the president from words or actions that could be interpreted as hostile.

Restrictive Civil Liberties

After war was declared, the issue of restricting civil liberties increased. During the years prior to the war, there were countless struggles with municipalities, states, and federal authorities over civil rights, most especially the Free Speech fights waged by the Industrial Workers of the World (IWW). Historians explain the suspension of civil liberties during the war as a necessity inasmuch as the issue of national security became a fundamental concern for the Wilson administration. America's entry into the war changed the discourse of civil liberties from one of conservative interests into a national issue. Shortly after the declaration of war, the congressional conservatives attacked Wilson for his lack of repressive measures when dealing with dissidents, whether it was the leader of the Socialist Party of America (SPA), Eugene Debs, or the social reformer, antiwar voice, Jane Addams. Wilson's response to the congressional criticisms was a proclamation that gave federal agents the right to arrest enemy-aliens, those who wrote or spoke against government policies. The antiwar voices were predominant in both the midwestern and northwestern states. Wilson and his administration wanted to destroy the mechanisms of dissent in the country.

Wilson quickly set up the Committee on Public Information (CPI) with the purpose of creating a national unity of public cooperation against the enemies of the state. One of its main purposes was to maintain multicultural solidarity for the war effort. The CPI quickly assumed a propaganda role, with a simple message that the enemy was everywhere and the good citizen should report any type of un-American behavior to the proper authorities. The CPI's message

was patriotism, and its role was to create consensus thinking about the war and American involvement in it, while asking all loyal Americans to act as a policing mechanism against those who dissented. The CPI was only the first agency created to suppress civil liberties during the war.

Directly after the declaration of war, Wilson created the Civil Service Commission (CSC) to investigate the loyalty of government employees. The CSC was given wide latitude to decide where there was a reasonable doubt of loyalty attached to any person then working for the government and those who applied for positions. This committee lasted until 1921, and many people were fired from federal agencies with no cause shown for the CSC actions.

During the following two years, the legislative branch passed a series of laws that would curtail civil liberties further. Wilson sent Congress the Espionage Act in May of 1917, which dealt with the issues of sabotage and spying for foreign powers, but it extended the powers of the federal government over the rights of free speech and a free press also. The Espionage Act broadened the use of the term *treason,* and it allowed the postmaster general to confiscate all materials that could be interpreted as treasonous under the loosely worded law. The law referred to simply treasonous language; however, with the new version of the Espionage Act it became open to interpretation by the postmaster general. Any newspapers, periodicals, or journals that were sent through the mails became scrutinized for language and content. This was especially applied to German-language and radical publications. The Anarchist Emma Goldman's *Mother Earth* and the Socialists' *The Masses* were two of the journals considered treasonous by the federal government, and their mailing privileges were rescinded. The editors of any publication that fit under this new law were liable to fines and federal imprisonment.

On the heels of the Espionage Act there followed another executive order from the president that directly affected the German population living in America. All German aliens over the age of fourteen had to be registered with the federal government and were barred from living or working in areas of the country that had any military importance. This selected group had to get federal permission to move within the country and were also required to report any change in their employment or living circumstances. These new restrictions affected nearly 600,000 Germans living in the country. Over 2,000 of them were considered national security risks and were accordingly interned.

The second piece of national security legislation passed in 1917 was the Trading with the Enemy Act. Although superficially it dealt with trade to either Germany or Austro-Hungary, it contained a domestic clause that allowed the postmaster general to suspend the mailing privileges of all publications that in his estimation were not in the best interests of the nation. This struck at the heart of the radical and labor movements.

In 1918, two acts were passed that gave the government more power over the individual. The first was the Alien Act, which granted the commissioner of immigration the right to deport any nonnaturalized American suspected of actions or beliefs that were not in agreement with the government. The Alien Act also allowed the government to remove from American shores anyone who spoke openly against the government. For the radical and labor movements whose memberships had a large number of first-generation, nonnaturalized citizens on their roles, this act would destroy their movement's base of support. The last act passed during the war period that curtailed civil liberties was the Sedition Act of 1918. This act placed a sweeping ban on any printed or published language that was disloyal to the government or the military. The penalty was federal prison and a hefty fine.

The laws, viewed benignly, could be interpreted as an attempt to unify the nation in a time of war, but the Wilson administration enforced these laws with a great deal of vigor. Albert S. Burleson, the postmaster general, took to heart the Trading with the Enemy Act and began suppressing mailings of journals in which radical and even those who were native-born Americans criticized the war or the administration. He hated the radical and labor movements, and so their journals and newspapers were suppressed without delay. Former congressman Victor Berger, the editor of *Milwaukee Leader*, a Socialist publication, had his newspaper repressed, but he was also convicted of violation of the 1917 Espionage Act and was not allowed to take his seat after being reelected to Congress in 1918.

The Justice Department vigilantly hunted people who were deemed enemies of the state under these new laws. It prosecuted over 2,000 people under the Espionage Act and nearly 1,000 under the Sedition Act between 1917 and 1919. The most famous case prosecuted under the Espionage Act was that of the Socialist and labor leader Eugene Debs for statements he made at an antiwar rally in Ohio. Debs refused to disavow his statements and took the opportunity in court to avow his Socialist beliefs. He was sentenced

to ten years in a federal prison. The most famous case prosecuted under the Sedition Act was that of the Anarchists Emma Goldman and Alexander Berkman. The Sedition Act was a more explicit version of the Espionage Act. Goldman and Berkman, neither a naturalized American citizen, had journals that condemned preparedness prior to the war and worked to stop conscription and condemn the government after America entered the war. They were Russian by birth, and after the Bolsheviks overthrew the government of Russia in 1917 and with anti-Russian feelings running high in the government, it was almost inevitable that the two would be tried and convicted for their inflammatory publications. They were the first tried and deported using the Sedition Act.

What occurred during World War I was simply governmental institutions being used to regulate free speech. The entire nation did not agree with the repressive measures being used to counter antigovernment rhetoric; concerned citizens and those who dissented formed organizations to defend the nation from encroachments of and intrusions on civil liberties. A young social worker who refused to register for the draft, Roger Baldwin, formed the National Civil Liberties Bureau in 1917. It was later renamed the American Civil Liberties Union (ACLU). Its purpose was to defend the right to free speech and free opinions against both governmental and private attempts to rescind those rights.

The Courts and Civil Liberties

During the war years, the U.S. Supreme Court was very reluctant to take on the issue of civil liberties. With the war raging in Europe and following American involvement, the Court moved very slowly to take on appeals such as the convictions of Victor Berger and Eugene Debs. They did reverse Berger's conviction on court procedural grounds, but Berger was still not allowed to take his seat in Congress. As for Eugene Debs, the Court found in 1919 that his conviction should be upheld on the grounds that the speeches he made against the war and draft registration were impediments to the government carrying out its laws. Later that same session, Justice Oliver Wendell Holmes would use *Schenck v. United States* (1919), another case of a radical convicted under the Sedition Act which restricted free speech when there were circumstances when the right to free speech presented a "clear and present danger" such as during war. Thus, the Supreme Court sided with the Wilson administration that the war activities were of greater importance than the individual's right to free speech, and therefore the rights articulated in the Constitution could be suspended during certain circumstances. Holmes was criticized for the "clear and present danger" decision by constitutional proponents such as Harvard Law professor Zechariah Chafee and Judge Learned Hand. By mid-1919, during the height of the Red Scare that followed the war, Holmes would become one of the leading Supreme Court voices championing the right to free speech even during times of war.

During these years, when there were complaints that the Justice Department or postmaster general had gone too far in their restriction of civil liberties, the administration did nothing to change the way in which the government was operating. This attitude trickled down to local levels where German Americans were discriminated against. Some states and municipalities outlawed the teaching of German language or German-language books in libraries. German-language books were burned in some places, and other localities forbade the populace to speak German. State and local governments took this opportunity to impose laws similar to the Sedition Act, restricting the rights of radical political groups, especially the Socialists and the Anarchists. They also challenged the right of existence for radical labor movements such as the IWW. The IWW never spoke out against the war because they believed that there was a more urgent war than the one in Europe and that was the war with capitalists. Many states refused to seat Socialists or other political radicals in their state or local legislatures. These different actions were infringements of civil liberties and political repression.

After the Armistice was signed in 1919, there was no immediate change in the government's attitudes toward radical groups within the country. The government continued to use the wartime legislation during the demobilization effort as it feared that there would be social unrest. Although Socialist parties in many states in the South and the Midwest had broken apart, there remained great support in the North and midwestern states. The government did not want a political challenge, and with the creation of the American Communist Party the laws that had been in place during the war were not rescinded. The year 1920 was a terrible year for civil liberties; with the war over, many Americans wanted a return to "normalcy" (a term popularized by Republican presidential candidate Warren G. Harding) as quickly as possible. The country was plagued by labor strikes as the workers who had had not been allowed to negotiate labor con-

tracts during the war believed that the moment had come to allow the workers to share in the profits that were made by big business during the war. The race riots that occurred in over twenty-five cities that year showed the government that the transition from war to peace was not going to be easy.

The Red Scare

Federal officials believed that the problems that plagued the nation emanated from some outside force labeled bolshevism. The United States had troops involved with the civil war that was taking place inside the old Russian Empire, and there was a great deal of concern that the revolution taking place in Russia could be transported abroad. It appeared that many of the nations in Western Europe were infected by revolution in the same way that Russia had been in 1917. The American government did not want revolution in this country, so the continued repression of civil liberties was seen as a necessity. In June a series of mail bombs were sent to government officials and business moguls. The new attorney general, A. Mitchell Palmer, was the recipient of such a bomb. The Justice Department's response was to utilize the same legal means that had been used during the war to suppress civil liberties. These were now turned in earnest against the population. This eighteen-month period, 1919 to mid-1920, is called the "Red Scare." It was a short, difficult time in America as the repression and patriotism that had clashed before and during the war acted the final scene of this era where civil liberties were abrogated. The "Palmer Raids," named after Attorney General A. Mitchell Palmer, who authorized them, were carried out against political and labor radicals. Their headquarters were raided, literature was confiscated, printing presses were smashed, and members were arrested under the same acts that had been used against aliens during the war. The atmosphere was filled with propaganda, patriotism, and Americanism during this period. The laws utilized to protect American interests during the war were now used in the courts against Americans. Palmer wanted to eliminate radical labor and political movements through use of the wartime legislation. Labor and political activists were arrested and tried on espionage or sedition charges, and the Justice Department used the Immigration Act of 1917 to set aside those individuals who were not naturalized Americans for deportation. The attorney general claimed that many of these people were Communist agents and that their sole purpose in agitation was to bring the American government down. The American people continued to support the government and the programs of repression until early 1920, after the first boatload of detainees was deported. Several factors led to lessening support for this war against Communism; the press and government officials opposed continuation of the civil rights violations; Palmer had overplayed the role of dissidents in America; the fear of Communist revolutions in Western Europe did not materialize; and by early 1920 most radical political and labor movements in America had been destroyed or severely debilitated. By mid-1920, there were many powerful and respected voices who called for investigation into Palmer and the methods he had used. There were also calls for the negation of the wartime legislation and a resumption of civil liberties. This period of repression ended without any fanfare, but it was only the first in a twentieth century filled with civil liberties abuses.

Antiwar Movement: World War II

Although the American peace movement virtually collapsed following the Japanese attack on Pearl Harbor in December 1941, it had been strong and vibrant in the period between the two world wars. It was aided by the great disillusionment following World War I, especially after writers focused their literary efforts on exposing the dark side of total warfare. Some of these writings included Henri Barbusses's *Under Fire* (1916), Siegfried Sassoon's *Counter-Attack* (1918), Ernest Hemingway's *A Farewell to Arms* (1929), Laurence Stallings's *What Price Glory?* (1924), and Erich Maria Remarque's *All Quiet on the Western Front* (1929). In addition, the poetry of Wilfred Owen (e.g., "Arms and the Boy") and T.S. Eliot (e.g., "The Waste Land") contributed to the antiwar sentiments.

But after Pearl Harbor, there was a rallying around the flag in which nationalism triumphed over any impulse for peace. Anyone who criticized the war was considered un-American. U.S. Senator Burton K. Wheeler, a staunch isolationist, characterized the national mood when he said, "The only thing now to do is lick hell out of them." Of the radical journals, only the *Call* and the *Progressive* called for nonintervention. The *Christian Century*, on the other hand, declared U.S. participation in the war a "guilty necessity."

Jeannette Rankin, the first woman elected to the U.S. House of Representatives, is remembered for being the only member of Congress to vote against the American declaration of war in both World War I and World War II. Although fifty members of Congress had voted against America's entry into World War I, in 1941 she was the sole dissenting voice. "This time I stood alone," Rankin later recalled. "It was a good deal more difficult than it had been the time before." Actively involved in the Women's International League for Peace and Freedom, the Women's Peace Union, and the National Council for the Prevention of War, Rankin spent the 1930s lobbying against a $616-million naval building bill. If her election to Congress in 1941 represented a second wind for her political career, voting against the war signaled the beginning of the end to her office-holding days.

Between 1919 and 1925, the peace movement was characterized by three main groupings: internationalists, pacifists, and liberal reformers. The movement was comprised of feminists, educators, political reformers, liberal Protestants, and progressive activists. By and large, women were the backbone of the peace groups. Internationalists were associated with the League of Free Nations Association (founded in 1918) and the League of Nations Non-Partisan Association (founded in 1923), the latter of which in 1929 became the League of Nations Association and still later, following World War II, the United Nations Association of the United States of America. Pacifists were represented by the Women's International League for Peace and Freedom (founded in 1919) and the War Resisters League (founded in 1923). Liberal reformers rallied around the National Council for Prevention of War (founded in 1921) and the National Conference on the Cause and Cure of War (founded in 1924).

Peace advocates found credence in the Kellogg-Briand Pact, which was initially signed by the world's major powers on August 27, 1928. Formally known as the Pact of Paris, Kellogg-Briand went beyond the naval disarmament agreements by outlawing war as an instrument of foreign policy. Named after Frank Kellogg, the U.S. secretary of state under President Calvin Coolidge, and Aristide Briand, the French foreign minister, the treaty was supported by those Americans who desired isolationism. Although forty-seven countries, including the United States, were signatories to Kellogg-Briand, the pact lacked bona fide enforcement mechanisms. Nonetheless, peace supporters would cite Kellogg-Briand for political justification long after the treaty was null and void.

On February 25, 1941, members of the Massachusetts Woman's Political Club protested at the White House against the Lend-Lease Act, which provided military support to Great Britain in the early years of World War II. Antiwar sentiment drew wide support in the 1920s and 1930s but collapsed virtually overnight following the Japanese attack on Pearl Harbor on December 7, 1941. *(Brown Brothers)*

movement for the first half of the twentieth century was 1921 with the establishment of the National Council for Prevention of War (NCPW). Founded in Washington, D.C., by representatives of seventeen national peace organizations, the NCPW was active in every state. Its executive secretary, Frederick J. Libby, decided to devote his life to the cause of peace after touring Europe in the aftermath of World War I. The NCPW supported international agreements for the reduction of armaments, advocated a progressive world organization, and worked toward a global system of education for peace. Its *News Bulletin* (1921–1934) and *Peace Action* (1934–1968) kept readers informed about peace issues. In 1936, when the NCPW was at or near its peak, the *Peace Action* had a circulation of 25,000. As World War II neared, the NCPW lobbied for neutrality legislation and the requirement for a war referendum.

The American League Against War and Fascism, formed in New York City in the autumn of 1933, had as its primary mission the protection of the Soviet Union. According to its manifesto, "Serious struggle against war involves rallying all forces around this peace policy, and opposing all attempts to weaken or destroy the Soviet Union." Although it was a Communist-front organization, it attracted many people who were not Communists, including Norman Thomas of the Socialist Party, Roger Baldwin of the American Civil Liberties Union, A.J. Muste of the Conference for Progressive Labor Action, and the the-

ologian Reinhold Niebuhr. In November 1937, the organization changed its name to the American League for Peace and Democracy.

In February 1938, Norman Thomas opened his "Keep America Out of War" campaign, offering the Left a non-Communist antiwar front. Three months later, he helped establish the Keep America Out of War Congress, which received support from the National Council for Prevention of War. Thomas's slogan was, "The maximum American cooperation for peace; the maximum isolation from war." After Pearl Harbor, the group officially disbanded but was reincarnated as the Provisional Committee Toward a Democratic Peace, taking on a role similar to the People's Council for Peace and Democracy of World War I. The Provisional Committee championed civil rights at home and advocated a more equitable distribution of the war costs. It also stressed the need for a just and lasting peace after World War II.

The America First Committee was formed in 1940 with the purpose of preventing the United States from repeating the mistakes that led to World War I. Charles Lindbergh, Chester Bowles, and Stuart Chase were some of the well-known figures of this organization. Lindbergh, who accepted a medal from Adolf Hitler in 1938, was forced to resign his commission in the U.S. Air Corps Reserve because of what was seen as his pro-German stance. After America's entry into the war, however, Lindbergh served as a consultant for the aircraft industry and even went on missions in the Pacific on behalf of the U.S. Air Force.

Beginning in June 1943, the peace movement had a moderate resurgence. Dave Dellinger, a Socialist, founded the People's Now Committee with the objective of the immediate end of the war. In July of that year, George W. Hartmann of the War Resisters League and Quaker Dorothy Hutchinson organized the Peace Now Movement (PNM) as a conservative counterpart to Dellinger's group. Hartmann and Hutchinson attempted to tap into the America First constituency, but consequently existing peace groups shunned their efforts. In its statement of purpose, the PNM called on the United States to formulate "fair and reasonable" peace terms. The Friends Committee on National Legislation was founded in November to lobby Washington for war relief, civil liberties, and racial justice. Similarly, pacifists such as A.J. Muste and Evan Thomas focused their energies on organizing relief services for war refugees and the families of imprisoned conscientious objectors, while at the same time denouncing the internment of Japanese Americans and the saturation bombing of civilian populations.

Although the peace movement floundered after Pearl Harbor and lost even more momentum after the Holocaust came to public light, pacifists were emboldened. The Fellowship of Reconciliation and the War Resisters League (WRL) actually thrived. Between 1939 and 1945, the WRL, for example, grew from 900 to 2,300 active members, with an income that increased from $5,000 to $20,000. Of the 10 million males ordered to report for military induction, 42,973 were classified as conscientious objectors. A total of 6,086 were imprisoned during the war.

A number of prominent Protestant clergymen maintained their pacifist stance, including Harry Emerson Fosdick, Methodist Bishop Paul B. Kern, and Episcopal Bishops Walter Mitchell and W. Appleton Lawrence. Three out of four Quakers and three out five Mennonites chose conscientious objector status. Jehovah's Witnesses constituted the largest dissent group during World War II, refusing military induction as well as participation in the Civilian Public Service. Consequently, many were imprisoned. As a political force, they were not very strong because they remained aloof from other objectors and pacifists. Jehovah's Witnesses were less against war than they were against being controlled by the government. Although there was the Association of Catholic Conscientious Objectors (founded in 1940) and a chapter of the Women's International League for Peace and Freedom in Rockaway, New York—that was comprised mainly of Jewish members—very few pacifists were representative of the Catholic and Jewish faiths.

Antiwar Movement: Vietnam War

The Vietnam War—America's longest war—left much of Southeast Asia in ruins and divided Americans more than any other event in the nation's history since the Civil War. As the war unfolded on the other side of the globe—with horrific results—at home it gave rise to one of the most resilient, widespread, and diverse social protest movements. The antiwar movement began as a small series of protests, organized mostly by seasoned Old Left activists. Early antiwar actions were often discouraging affairs for planners and participants alike. They received scant media attention and were often overshadowed by even larger pro-war demonstrations.

But years of persistent organizing transformed various scattered actions into a cohesive, mass, nationwide movement, with respectable adherents and a solid base of popular support. By the late 1960s and early 1970s, an increasing number of antiwar actions became more localized, grassroots efforts, as national antiwar coalitions fragmented, then regrouped into new entities, only to split again. Still, the movement would remain a potent force well into the 1970s. Within its ranks were senators and representatives, homemakers, college and high school students, civil rights activists, Maoists, countercultural youths, poets, Vietnam veterans, clergy, business executives, blue-collar workers, scientists, professors, African Americans, Latinos, soldiers and veterans, pacifists, draft resisters, and others.

The movement drew support from hundreds of organizations, but no single group dominated it. Thus, it was far from monolithic. Within its ranks, liberal Democrats vied with Trotskyists. Student militants sometimes split with their seasoned elders. Leaders debated tactics, while ordinary participants created protest signs and banners that reflected their own personal concerns about the war. Countercultural youths who felt a natural rapport with the goals and aims of the movement drifted in and out of marches, while clean-cut supporters of Senator Eugene McCarthy (D-MN) turned their attention from Democratic Party campaigning to organizing the 1969 Moratorium protests. The killing of four students at Kent State University in Ohio and two students at Jackson State in Mississippi days later in May 1970 further intensified the divisions in American society and left the movement reeling but continuing. Vietnam veterans reenergized the movement when they marched on Washington in April 1971, briefly lobbied members of Congress, and then threw away their medals, ribbons, citations, and other military items on the steps of the nation's Capitol.

Amid all of the national convulsions of the late 1960s and early 1970s, the antiwar movement ground on, ebbing in the early 1970s but never disappearing until the Vietnam War itself ended with the defeat of South Vietnam and the United States at the end of April 1975. But the antiwar movement was not—as some scholars and authors have insisted—simply the result of a generational split between baby boomers and their parents. It was deeper, more complex, and more widespread than that. It cut across virtually all lines, including class, race, gender, and age. Although students played a vital role in the movement, particularly early on, they never dominated it the way that the movement's detractors have suggested. In 1973, a political scientist who studied the era concluded, "No case can be made for the popular proposition that 'youth' was in revolt over the war. . . . The poll data argue that although some young people may have been deeply opposed to the war, 'youth' as a whole was generally more supportive of the war than older people." The antiwar movement was, observed historians Charles DeBenedetti and Charles Chatfield, "a typically American reform effort—a voluntary crusade attracting adherents and impelling them to act out of a felt personal responsibility for social wrongs."

Events in Vietnam

During the 1950s and early 1960s, U.S. involvement in Vietnam deepened at an incremental, yet steady,

pace. It began with the Truman and Eisenhower administrations supporting the French war effort, eventually financing 80 percent of it by the early 1950s. With the end of the French war in the spring of 1954, U.S. officials reevaluated and revised America's Indochina policy. After 1954, U.S. officials supported and financed the newly created South Vietnamese government under the leadership of the autocratic president, Ngo Dinh Diem. In 1961, under the newly elected Kennedy administration, the number of U.S. military personnel and advisers in Vietnam escalated sharply, surpassing 16,000 by the end of 1963. Kennedy hoped this increase, coupled with his favored policy of training South Vietnamese soldiers and indigenous ethnic people in rural areas in low-intensity counterinsurgency warfare, would bolster the vulnerable South Vietnamese government. But years of nepotism and repressive policies left the Diem regime even more vulnerable in 1963 than it had been at the time of its inception in 1954. Exacerbating matters for Diem was a press corps of highly talented young journalists, including David Halberstam, Peter Arnett, and Neil Sheehan, whose dispatches often illuminated the rampant corruption in the Saigon regime. With the tacit approval of the Kennedy administration and America's ambassador to Vietnam, Henry Cabot Lodge, Diem's generals staged a coup on November 2, 1963, ousting the unpopular leader. The generals assassinated Diem and his brother, Ngo Dinh Nhu, head of the security forces in South Vietnam. Three weeks later, Kennedy himself would be shot and killed in a motorcade in Dallas, Texas.

President Lyndon Johnson continued following a trajectory set by Dwight Eisenhower and John F. Kennedy, steadily increasing the number of advisers and personnel in Vietnam. Reacting to the potent legacy of McCarthyism, Johnson feared his reputation would not withstand the disaster of "losing" South Vietnam to the Communists. Republican accusations that President Harry Truman had "lost" China to the Communists were still fresh in his mind. Johnson also feared that failing to act in Vietnam would undermine his "Great Society," the most ambitious federal aid programs since the New Deal. In early August 1964, Johnson went on national television, claiming that two U.S. naval destroyers—the USS *Maddox* and USS *C. Turner Joy*—had been attacked by North Vietnamese PT boats. Johnson claimed that two separate attacks had occurred (most historians dispute the second one) but neglected to tell the American public that the two destroyers were involved in a larger U.S.-backed covert effort to destabilize Communist North Vietnam. Johnson, claiming the attack was an act of Vietnamese Communist belligerence, went before Congress asking for far-reaching powers to take whatever steps necessary—even military force—to repel attacks against U.S. forces and to protect Southeast Asia from Communist aggression. His so-called Tonkin Gulf resolution passed the Senate with only two dissenting votes (Senators Ernest Gruening [D-AK] and Wayne Morse [D-OR], who would go on to achieve heroic status in the antiwar movement) and moved unanimously through the House of Representatives. In February 1965, following a Viet Cong attack on Pleiku that killed nine and wounded more than 100 Americans, Johnson authorized massive air strikes over Vietnam, dubbed "Operation Rolling Thunder." By the end of 1965, nearly 200,000 marines and army troops would arrive in Vietnam.

The Birth of a Movement

Antiwar organizers wasted no time in responding to Johnson's resolution. Even before the Tonkin Gulf resolution, an incipient antiwar movement struggled for support. When South Vietnamese president Ngo Dinh Diem cracked down on Buddhist opposition in the spring and summer of 1963, small antiwar protests occurred in New York and other major cities, demanding an end to U.S. aid to the Diem regime. On December 19, 1964, more than 1,500 people braved the frigid winds of New York to hear antiwar speeches delivered by A.J. Muste, A. Philip Randolph, and Norman Thomas. Smaller demonstrations took place in San Francisco, Minneapolis, Miami, Austin, Philadelphia, Chicago, Washington, D.C., Boston, and Cleveland. These early protests were sponsored and organized by the Fellowship of Reconciliation (FOR) and the War Resisters League (WRL), two pacifist groups with long histories. The American chapter of FOR, a religious interfaith pacifist organization headquartered in New York, was founded in 1915. FOR had resisted U.S. military participation in both world wars and called for nuclear disarmament during the Cold War. In 1963, FOR had been at the forefront of monitoring the repression of Buddhists by the Saigon regime, and the organization sponsored antiwar protests immediately after the Tonkin Gulf resolution. The WRL, a more radical and confrontational group than FOR, was founded in 1923. During World War II, it supported conscientious objectors and war tax resisters, and in the Cold War, it sponsored civil disobedience against civil defense drills and nonpayment of taxes used for weapons spending. In a bold move

Flashing the two-finger peace sign, antiwar protesters gather in Berkeley, California, in 1969. Following the emergence of the Free Speech Movement at the college campus in 1964, Berkeley remained one of the centers of the student protest movement. *(© Underwood Photo Archives, Inc.)*

against escalation in Vietnam, the WRL sponsored a demonstration in New York City on May 16, 1964, at which twelve men burned their draft cards. Other pacifists played a crucial role in the early period, including a group of influential nonviolent radicals—among them, Dave Dellinger, A.J. Muste, and Staughton Lynd—all activists, as well as editors at the radical monthly *Liberation* magazine. Eventually, other Old Left radicals—Trotskyists in the Socialist Workers Party, Communist Party members, and a variety of independent progressives—would also contribute significantly to the antiwar coalition of the 1960s and early 1970s.

The early antiwar movement owed much to these pacifists and old left enclaves. But other important influences shaped the movement as well. Even before the first antiwar protests, the civil rights movement had already prompted President Lyndon Johnson to begin dismantling repressive Jim Crow institutions in the South. The nonviolent Southern freedom struggle helped define the tactics and agenda of the antiwar movement and furnished it with a steady stream of seasoned organizers. Similarly, the Berkeley Free Speech Movement (FSM) in the fall of 1964 also inspired antiwar activists. The FSM culminated in a semester-long confrontation that pitted a coalition of students, their faculty supporters, and various Bay Area activists against University of California admin-

istrators who had banned student political tables near the UC Berkeley campus.

Finally, the burgeoning New Left also influenced the antiwar movement. The New Left, emerging during an era when liberalism flourished across America, appealed to primarily young activists. These radicals were, in the words of sociologist and New Left adherent Richard Flacks, "disaffected from all 'established radicalisms,' " and "self-consciously sought to provide political direction, theoretical coherence and organization continuity to the student movement." The main New Left group of the 1960s, Students for a Democratic Society (SDS), had grown out of the Old Left League for Industrial Democracy in 1960. By June 1962, a group of sixty SDSers gathered at an American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) camp in the woods at Port Huron, on the southern shore of Lake Huron and drafted a sweeping manifesto, the Port Huron Statement. The statement condemned militarism, fanatical anti-Communism, the arms race, racism, excessive corporate power, and public apathy. It called for a politics of "authenticity," which involved more personal empowerment, a deeper interconnectedness, and greater grassroots control of political institutions, dubbed "participatory democracy."

SDS organized the first major antiwar action, a march of 25,000 people in Washington, D.C., on April 15, 1965. On that beautiful spring day, with cherry blossoms in full bloom, the huge crowd gathered at Washington Monument and listened to speeches by the venerable radical journalist I.F. Stone, civil rights activist Bob Moses, Alaska senator Ernest Gruening, and SDS president Paul Potter. Joan Baez, Phil Ochs, and Judy Collins provided the music. Then the huge crowd marched to the nation's Capitol to deliver an antiwar petition. It was, at that time, the largest antiwar demonstration in American history. The march generated headlines across the country and seemed to herald the birth of a new movement. It greatly enhanced the prestige of SDS, which, despite its huge influence on the early antiwar movement, would shortly thereafter abdicate its role as a "single-issue" antiwar organization at its June convention in Kewadin, Michigan. It was an unfortunate move, one that many SDSers would later regret. The decision briefly created a vacuum that other antiwar groups wasted no time in filling.

From its outset, the antiwar movement was strikingly diverse. Just as Walt Whitman said that America was not one nation, but a "teeming nation of nations," so the antiwar movement consisted of many different struggles, each with different aims and tactics that unfolded in communities across the country. Numerous organizations emerged, some lasting only briefly, others enduring through the war's duration. Tactics and strategies varied widely, depending on the participants. Despite a shared conviction within the movement that the Vietnam War was immoral and unjust, and a shared urgency that it had to be ended as soon as possible, it was often difficult to find the cement to coalesce the disparate antiwar forces.

1965: The Year of Vietnam

The array of protests throughout the very busy year 1965 reflected the breadth and diversity of the movement. Prior to SDS's highly successful April 15 march, the radical pacifist Committee for Nonviolent Action (CNVA)—a small group of antinuclear activists around since the 1950s—declared 1965 "the Year of Vietnam." CNVA organized pickets and civil disobedience in various locales on February 7. Meantime, students and faculty at the University of Michigan busily organized the first teach-in on the Vietnam War, held in March 1965. The Michigan teach-in, which offered the war's critics in academe an opportunity to speak out against it, attracted an audience of thousands and inspired countless other teach-ins on campuses across the nation. Other protesters resorted to more desperate acts. On March 16, eighty-two-year-old Alice Herz, a widow who had fled Nazism in Germany, set herself afire in the streets of Detroit. "I choose the illuminating death of a Buddhist to protest against a great country trying to wipe out a small country for no reason," she wrote, referring to Buddhist protesters who immolated themselves in protest against the Saigon regime. Later, she would be joined by Baltimore Quaker Norman Morrison, who set himself on fire in November near the Pentagon, and Catholic activist Roger LaPorte, who immolated himself near the United Nations building.

Most antiwar protesters chose more conventional ways of expressing opposition to the war, listening to speakers at rallies and participating in marches. For the first few years of the antiwar movement, large pro-war demonstrations often overshadowed antiwar gatherings. In many cases, the pro-war counter-demonstrators carried signs denouncing Communism and "peaceniks," and they often spent more time in the media spotlight than the war's foes. "Love it or leave it" and "Go back to Hanoi" were familiar refrains. But the pro-war rallies rarely deterred determined antiwar activists. Following SDS's April 15 event, waves of protests—many spontaneous, local,

and grassroots in nature—continued across the country. The year's activities culminated with an equally successful Thanksgiving antiwar march sponsored by the National Committee for a Sane Nuclear Policy (SANE). Throughout the year, new antiwar groups emerged in cities and towns across the country, some headquartered in elaborate offices with telephones and filing cabinets, others based in people's homes and apartments and linked to the outside world by P.O. box. By the end of 1965, there were over thirty different antiwar organizations, each sponsoring events and planning various activities. The following year, 1966, has been characterized by contemporary observers at the time, and historians in more recent years, as a period of slackening and slowdown within the antiwar movement. Fewer demonstrations generated headlines, and the movement seemed to lose its momentum. But a great deal of significant, behind-the-scenes coalition building occurred that year.

Building a National Coalition: The Spring Mobilization

The first national coalition of significance was the Spring Mobilization Committee to End the War in Vietnam. The "Spring MOBE," as it was called, grew out of a two-day meeting in Cleveland, Ohio, in September 1966, organized by the Inter-University Committee for Debate on Foreign Policy, the intercollegiate faculty group that had organized the first campus teach-ins. Originally called the November 8 Mobilization Committee, the group later renamed itself the Spring Mobilization Committee and functioned as an ad hoc national group whose purposes were to forge a coalition of existing peace groups and begin planning national demonstrations for April 15, 1967, in New York and San Francisco. A.J. Muste, a lifelong pacifist and radical activist, became the group's chairman. By this time, Muste, a revered elder father figure of the movement, was in his early eighties and a familiar sight at many early demonstrations, with his lanky frame, trademark hat, narrow tie, and overcoat. Born in the Netherlands in 1885, Muste came to America at age six and had a long history of involvement in a wide variety of progressive causes. In the Great Depression, he briefly embraced Trotskyism but returned to radical Christian pacifism. He remained a devoted antiwar and antinuclear activist during World War II and the Cold War, and maintained ties with the civil rights movement.

Widely regarded as the "founding father" of the antiwar movement and admired by even his harshest critics, Muste was an effective coalition builder whose warm personality lured the finest activists of the era into the fold. He envisioned a unifying, umbrella organization that could bring together the diverse elements of the peace movement. But the aging Muste never lived to see the event he worked so hard to plan. He died of a stroke in February 1967, at age eighty-two. Organizers mourned his loss and soon discovered that keeping the Spring Mobilization together without him would be a difficult task. Liberals affiliated with SANE demanded a purge of Communists and Trotskyists from the coalition. Radical pacifists, such as Dave Dellinger, advocated widespread civil disobedience to protest the war. Activists associated with the Trotskyist Socialist Workers Party (SWP), under the guidance of veteran SWPer Fred Halstead, showed grim determination in exerting their influence in the movement, demonstrating an uncanny stamina at meetings.

But the end result of their hard work, the April 15, 1967, Spring Mobilization to End the War in Vietnam, was a triumph. Over a quarter of a million people assembled at Sheep Meadow in New York City's Central Park, and the gigantic throng marched to the United Nations Building, carrying antiwar signs and banners. The event's success owed much to a rousing antiwar speech delivered by Reverend Dr. Martin Luther King Jr. at the United Nations Building.

Dr. Martin Luther King Jr. and the Antiwar Movement

Since 1965, King had had serious misgivings about the war, but in public he remained silent about the matter, fearing he would alienate liberal supporters in high places. Moreover, King felt uneasy about the presence of Communists and other radicals in the leadership of the antiwar movement. Moderate civil rights leaders, such as Roy Wilkins and Bayard Rustin, counseled him against condemning the war publicly. However, younger and more militant African Americans, many of them gravitating toward "black power," were losing faith in King as a result of his silence regarding the war. King's own close associate, Reverend James Bevel, repeatedly advised King to speak out against the war or risk losing his prestige. By 1967, with 380,000 soldiers in Vietnam and no end to the war in sight, King's opposition to the war eclipsed his concerns about the antiwar movement. On April 4, 1967, he delivered an impassioned condemnation of the war at Riverside Church in New York City. In the speech, he concluded, "I would never

again raise my voice against the violence of the oppressed in the ghettos without having first spoken clearly to the greatest purveyor of violence in the world today—my own government."

King's speech two weeks later at the massive April 15 Spring Mobilization march elevated the prestige of the antiwar movement to new heights. By 1967, the antiwar movement had evolved from a series of peripheral and scattered actions to a mass protest movement. After April 15, the media and policymakers began taking the movement seriously. New antiwar groups appeared, greater varieties of dissent flowered, and in Washington, D.C., congressional doves took bolder stands against the escalating war in Southeast Asia. Six months later, organizers of the Spring Mobilization planned an equally successful event, the October 21 March on the Pentagon. One hundred thousand peaceful protesters, including GI's and veterans, clergy, minorities, and countercultural peaceniks, listened to speakers at the Lincoln Memorial. Then 35,000 marched to the Pentagon, where spirited youths placed flowers in the rifle barrels of military police.

The antiwar movement entered its renaissance, but it would remain a diverse "movement of movements," more difficult than ever to coalesce. Women, GI's and veterans, draft resisters, students, and minorities all formed key segments in the movement.

Women and the Movement

From the outset, women played an instrumental role in the antiwar movement. Women from all walks of life became active participants. One of the first petition drives against the war was launched by the Women's International League for Peace and Freedom (WILPF). The WILPF, one of the oldest peace groups in America, grew out of the Woman's Peace Party, founded in 1915 by several Progressive women, including social reformer Jane Addams. It remained a formidable antiwar network during the 1960s, planning several events and maintaining chapters across the United States. A much newer organization, Women's Strike for Peace (WSP), held its founding convention in Ann Arbor, Michigan, in 1962, with a far-reaching agenda to end the nuclear arms race. When the Vietnam War began, WSP leaders switched the group's focus to antiwar organizing. Across America, WSP members went door-to-door collecting signatures for petitions, mailed protest letters to policymakers, staged public rallies at city halls, and encouraged neighbors to resist the war. The group's March on the Pentagon in February 1967 generated much media attention.

Other women's groups had a strong impact. In March 1967, a gathering of fifteen women from Beverly Hills, California, launched Another Mother for Peace (AMP), which began in March 1967 by selling 200,000 antiwar Mother's Day cards to citizens to send to their member of Congress. The group grew rapidly, thanks to celebrity endorsements from liberal celebrities such as Paul Newman and Debbie Reynolds, and eventually it emerged as a powerful antiwar lobbying group. AMP provided support to Daniel Ellsberg and Anthony Russo when they released the Pentagon Papers to the *New York Times* and other media outlets.

Women role models were numerous in the antiwar movement. Perhaps the most effective and highly visible organizer was Norma Becker, a New York public school teacher, single mother of two, and veteran of various civil rights struggles. Becker was a cofounder and coordinator of the Fifth Avenue Peace Parade Committee, a coalition of several New York antiwar groups that organized the Fifth Avenue Peace Parade held on March 26, 1966. The parade drew 50,000 participants and was one of the success stories of the early antiwar movement. Becker would remain a key leader in the movement until the end of the war, assuming important high-level positions in the National Mobilization Committee to End the War in Vietnam (also known as "the MOBE," the successor to the Spring Mobilization) and various draft resistance programs. Becker and other women would always be instrumental in the flourishing struggle against the war, and the rise of feminism in the late 1960s and early 1970s strengthened their position as leaders and contributors to the movement.

The Religious Community

Religious opposition remained strong throughout the entire war. The interfaith Fellowship of Reconciliation organized the earliest antiwar actions, immediately following the Tonkin Gulf incidents and resolution. FOR sent fact-finding teams to South Vietnam to probe human rights abuses and eventually revealed the Saigon regime's torture of prisoners in cramped "tiger cages." FOR's executive secretary, Alfred Hassler, actively promoted an interfaith dialogue between Americans and Vietnamese, bringing the renowned Vietnamese Buddhist monk, poet, and activist Thich Nhat Hanh to the United States to speak in 1966 as part of a FOR-sponsored tour.

FOR inspired other religious figures to speak and

act against the war. William Sloane Coffin, chaplain of Yale University, emerged as one of the most eloquent antiwar spokespersons of the era and participated actively in demonstrations and civil disobedience. Along with Dr. John Bennett, president of Union Theological Seminary, and Rabbi Abraham Heschel of the Jewish Theological Seminary, Coffin cofounded Clergy and Laymen Concerned About Vietnam (CALCAV), an interfaith antiwar organization. Under the astute leadership of Richard Fernandez, CALCAV grew rapidly in the late 1960s and early 1970s, attracting thousands of religious dissenters from across the country. The most famous religious resisters were Catholic radicals Daniel and Philip Berrigan. The Berrigan brothers and seven other Catholic activists made headlines on May 17, 1968, when they broke into a draft board office in Catonsville, Maryland, stole 300 draft files, and set them on fire in the parking lot with homemade napalm.

Students and the Movement

In 1959, a few years before SDS's rise to prominence, the Student Peace Union (SPU) formed at the University of Chicago, founded by pacifists, liberals, and ban-the-bomb activists. By the next year, it had twelve chapters in the Midwest, and in the summer of 1962 the SPU could boast 2,000 members. At the beginning of the war, the SPU, along with FOR and WRL, shifted its attention to antiwar organizing. The SPU tapped into a rich source of activism—the student body of America's higher education system—which would eventually furnish a steady stream of recruits to the antiwar movement. The growth of higher education, which was owing largely to huge government expenditures, meant an unprecedented number of Americans attended universities in the 1960s. The number of students enrolled in colleges and universities climbed from 3.2 million in 1960 to 7.5 million in 1970. Few American students embraced radicalism in the mid-1960s. A *Newsweek* poll of 800 university students conducted in the spring of 1965 found that 90 percent expressed confidence in higher education, corporations, and the federal government, while 80 percent were pleased with college life and expressed confidence in organized religion and the military. Despite widespread conformity on campuses, students formed an important cornerstone of the antiwar movement. They organized the waves of teach-ins in 1965 and 1966. They committed civil disobedience against napalm manufacturer Dow Chemical at the University of Wisconsin-Madison in 1967. And in May 1970, many Americans were shocked and dismayed by the news of the war coming home when the Ohio National Guard opened fire on students, killing four at the Kent State University campus.

Most accounts of the era downplay the importance of the Student Mobilization Committee to End the War in Vietnam (SMC), likely because of the influence that the Trotskyist SWP exerted over the organization. But it was the SMC—not SDS—which drew significant numbers of students into the antiwar movement on college campuses across the nation. The SMC originated at a national student antiwar conference held in Chicago, December 28–30, 1966. The SMC operated all over the country and remained active through much of the antiwar movement, organizing several successful protests involving university and high school students and GI's.

Meanwhile, liberal college students campaigned for dovish political candidates, especially Minnesota senator Eugene McCarthy when he ran as an antiwar presidential candidate in 1968. Calling themselves "clean for Gene" (to disassociate themselves from countercultural hippies), students flooded into New Hampshire for the primaries and worked many long hours for the campaign. Even though McCarthy lost to Johnson in the primaries, the race was so close that President Johnson announced in March 1968 that he would not seek office again. Many of these young, idealistic liberal students would go on to organize the Moratoriums, a series of protests—candlelight vigils, church services, marches, and other events—held across America beginning in the fall of 1969.

Later in the antiwar movement, President Richard Nixon would single out antiwar students for attack. Nixon repeatedly claimed that the movement was dominated by students, "spoiled bums blowing up campuses," he called them. A highly publicized clash between "hard hat" construction workers and peaceful student demonstrators in lower Manhattan on May 8, 1970, proved a coup for the Nixon administration. A crowd of 200 angry workers descended on the students and began pummeling them with fists, crowbars, and wrenches, leaving seventy youths bloodied and dazed. Nixon used the event as an opportunity to reemphasize that the so-called silent majority was fed up with protesters and countercultural youths.

The Counterculture

The misconception that America's "war at home" was simply a youth protest movement grew out of the highly visible presence of young, countercultural men and women at events. The colorful, psychedelic youth

BOB DYLAN (1941–)

Bob Dylan was born in Duluth, Minnesota, as Robert Zimmerman on May 24, 1941, but grew up in the small town of Hibbing, Minnesota. Dylan learned guitar at the age of ten and the autoharp and harmonica at fifteen. While attending the University of Minnesota, he began performing under the name Bob Dylan and soon dropped out of school. He moved to New York City by early 1961, determined to meet his musical hero, Woody Guthrie, who was bedridden with Huntington's chorea, and to join the burgeoning folk music scene there.

In New York, Dylan became part of the Greenwich Village folk music scene, playing coffeehouses and spending time with musicians like Joan Baez, Phil Ochs, and Tom Paxton. Influenced by Huddie Ledbetter, Bo Diddley, Hank Williams, and Woody Guthrie, Dylan had a profound effect on folk and rock music. Though his earliest circulating recordings date from 1958, his first commercial release was in 1962 and instantly changed popular music. As a lyricist, he captured the cynicism, anger, and alienation of American youth, which reverberated in his harsh vocal delivery and insistent guitar-harmonica accompaniment. Among his many songs of social protest are "Blowin' in the Wind" and "The Times They Are A-Changin'." Dylan's style has evolved from folk ("Don't Think Twice"), to folk-rock ("Highway 61 Revisited"), to country blues ("Country Pie"). His decision to perform with an electric rock-and-roll band in 1965 at the Newport Folk Festival outraged his fans but further influenced popular music. Enigmatic and reclusive, he published an autobiography, *Bob Dylan*, *Self-Portrait* (1970), and a novel, *Tarantula* (1971).

Dylan is unquestionably one of the towering figures of late-twentieth-century popular music, mixing folk, country, blues, and rock on over forty albums. Although Dylan was an influential pop figure during the youth movement of the 1960s, his first number one hit, "Knocking on Heaven's Door," didn't come until 1973. During the 1980s, he toured extensively and recorded with other artists on several albums. In the 1990s, his songs found a new audience and more acclaim from the music industry: in 1991, he was given a Lifetime Achievement Grammy Award; his 1997 album, *Time Out of Mind*, won three Grammys; and in 2001 Dylan won the Academy Award for Best Song for his "Things Have Changed," from the movie *Wonder Boys* (2000).

James G. Lewis

culture of the 1960s frequently overlapped with the antiwar movement. The "hippies"—as the *San Francisco Chronicle* dubbed them in 1965—rarely proved to be committed activists. Young people with long hair and psychedelic clothing followed drug guru Timothy Leary's advice and began dropping out, living communally among enclaves of kindred spirits in the Haight-Ashbury District of San Francisco, the East Village of New York, and other communities. Their rejection of the dominant culture and all things associated with it, including the Vietnam War, resulted in a natural affinity with the antiwar movement. Some 1960s bohemians were far more political than others. Early in the movement, antiwar folk singers such as Bob Dylan, Joan Baez, Phil Ochs, and Judy Collins appealed to youthful protesters, inspiring many to become involved. In the mid-1960s, the New York Workshop in Nonviolence founded the enduring antiwar periodical *WIN* magazine, a favorite periodical of countercultural antiwar activists.

The earliest heavily publicized wedding of the movement and the new youth culture occurred at the January 14, 1967, "Human Be-In" at Golden Gate Park in San Francisco, a four-hour "Pow Wow" of rock music, Allen Ginsberg chants, and an antiwar speech by activist Jerry Rubin. Janis Joplin performed, as did Jefferson Airplane and the Grateful Dead. Twenty thousand attended. Later that year, "Human Be-In" speaker Jerry Rubin teamed up with SNCC activist Abbie Hoffman, *Realist* publisher and editor Paul Krassner, and other youths to form the madcap, irreverent anarchical Youth International Party, or the Yippies. Not so much a formal organization as a concept, the Yippies attempted to bridge the antiwar movement and the counterculture, with mixed, though often amusing, results. Whether tossing one-dollar bills from the balcony of the New York Stock Exchange and watching traders scramble for them, or attempting to levitate the Pentagon at the October 21, 1967, demonstration, the Yippies always added much-needed humor to the proceedings. Thanks to the Yippies and other vibrant countercultural groups, such as the Diggers, a radical, theatrical collective, the rebellious youth styles of the era heavily colored the antiwar movement by the late 1960s and early 1970s.

African Americans and Chicanos

Despite pervasive antiwar sentiment in the black community, the antiwar movement attracted few committed antiwar organizers. Even before the war, the militant Muslim Malcolm X linked the U.S. government policies in Indochina with the repression of Af-

rican Americans at home. A few years later, in January 1967, Reverend James Bevel of the Southern Christian Leadership Conference—Dr. King's group—became national chairman of the Spring Mobilization. Another close associate of King's, Reverend Ralph Abernathy, remained closely aligned to the antiwar movement throughout the 1960s. The Student Nonviolent Coordinating Committee (SNCC), whose sit-ins, civil disobedience, and voter registration had been highly successful in the South, was the first civil rights movement to condemn U.S. policy in Vietnam when it issued an antiwar statement in January 1966. When heavyweight champion Muhammad Ali refused induction, he was stripped of his crown and sentenced to a maximum penalty of five years in jail and $10,000 in fines. Ali's decision energized African Americans, particularly youths, who applauded his antiwar statement: "No Viet Cong ever called me a nigger." Various "black power" luminaries—including Stokely Carmichael and SNCC chairman H. Rap Brown—spoke at antiwar rallies. A 1970 study by journalist Wallace Terry found that widespread antiwar and black power sentiment existed among black GI's in Vietnam. But many black power militants felt estranged from the predominantly white antiwar leaders, who seemed to be ignoring problems in the black community. "We're not inside the peace movement," wrote SNCC leader Ivanhoe Donaldson, echoing the sentiment of other militants. "It's basically all-white. There's no way to relate to that."

Like African Americans, Chicanos (Americans of Mexican descent) often participated in antiwar activities but did not necessarily feel at home in the movement. Many Chicano activists worked in Chicano rights groups, such as La Raza Unida and the Brown Berets. But Chicanos also organized some highly publicized antiwar events. Denver activists founded the Chicano Moratorium Committee, which conducted its first demonstration on February 28, 1970, in East Los Angeles. Five thousand attended, despite heavy rain. Other Chicano Moratorium protests occurred across California, as well Texas, New Mexico, and Colorado. On August 29, 1970, the Chicano Moratorium held its biggest demonstration in Los Angeles. Twenty thousand people showed up. Clashes occurred between police and Chicano protesters. In a shootout at a local tavern, Los Angeles police shot and killed Ruben Salazar, popular columnist for the *Los Angeles Times.* By 1971, Chicano protest shifted away from the war and more toward issues having to do with community organizing and "brown pride." Although few Chicanos rose to positions of prominence and authority in the antiwar movement, their presence left an indelible mark.

Antiwar Policymakers

"I like to believe that the people in the long run are going to do more to promote peace than our governments," said President Dwight Eisenhower in 1959. "I think the people want peace so much that one of these days government had better get out of their way and let them have it." In the 1960s and 1970s, dovish politicians not only followed Eisenhower's advice, but they took the next step and actively supported the antiwar movement. U.S. undersecretary of state George Ball had opposed U.S. involvement in Vietnam from the time he joined the Kennedy administration in 1961. But his was a lone voice, and few in official Washington shared his concerns. Senator J. William Fulbright (D-AR), chairman of the Senate Foreign Relations Committee, emboldened many political doves when he conducted a series of televised Senate hearings critical of the war in January and February 1966. Fulbright had supported the Tonkin Gulf Resolution but gradually turned against the war the following year. His hearings enabled the war's moderate opponents, such as George Kennan, architect of the containment policy, and Lieutenant General James Gavin, to criticize the war from a respectable platform.

The Vietnam War caused deep divisions within the Democratic Party, often splitting the party in half. Senators Eugene McCarthy and Robert Kennedy (D-NY) ran for the presidency in 1968 on antiwar platforms. Kennedy's campaign was cut short by the assassin's bullet on June 5, 1968, and McCarthy's campaign floundered after Vice President Hubert Humphrey entered the race. But antiwar protesters targeted Humphrey during the 1968 Chicago Democratic National Convention for his pro-war position. During the convention, an antiwar platform drafted by Democratic doves was narrowly defeated. Four years later, George McGovern, the Democratic Party's 1972 presidential candidate, ran as an outspoken peace candidate. By this time, the Democratic Party opposed the war, and many politicians spoke at antiwar events. In addition, a growing number of Republicans, including Senator Mark Hatfield (R-OR), Representative Paul McCloskey (R-CA), and Senator George Aiken (R-VT), strenuously opposed the war in and out of the halls of Congress.

The Draft

In 1966, General Lewis B. Hershey, director of the Selective Service, stepped up the draft call from less than 10,000 to more than 30,000 per month, to meet the growing demand for troops in Vietnam. Hershey also supported draft deferments for university students, whom he regarded as "socially useful" members of society. The draft was widely unpopular among the nation's youth, and it became a lightning rod for antiwar protests. An antidraft movement was already under way before Hershey's decision. In May 1964, twelve men had burned their draft cards in an anticonscription protest. During the October 1965 Days of International Protest in New York City, pacifists organized a gathering at the Whitehall Street Induction Center, where one of the speakers, David Miller, a Catholic Worker activist, decided to burn his draft card instead of speak. The crowd of 500 applauded him. Miller was the first person to publicly burn a draft card since Congress had passed a law the previous summer making the act a felony. Miller's act touched off other draft card burnings. Of all the tactics employed by antiwar activists, draft card burning was one of the most controversial. Beginning with David Miller's defiant draft card burning in 1965, the media frequently spotlighted the draft card burners, and conservatives called for strict punishments against them. When Bruce Dancis and other activists at Cornell University burned draft cards in the spring of 1966, their actions generated a great deal of publicity and sparked similar protests elsewhere. Draft card burning divided the antiwar movement. Many liberal doves, as well as members of the Socialist Workers' Party, whose organization opposed civil disobedience, condemned draft card burning. Radical pacifists such as Dave Dellinger and Brad Lyttle supported and actively encouraged draft card burning as an important, symbolic form of resistance. Draft card burning hit a peak in 1967 and began to decline in the years that followed, as anti-draft organizers began to advocate the less dramatic approach of draft card "turn-ins," where young men simply returned their draft cards to authorities.

The first sizable antidraft demonstration occurred at the Spring Mobilization protest on April 15, 1967. Before the march, 175 men gathered in Sheep Meadow in Central Park and burned their draft cards in an action organized by antidraft organizer Bruce Dancis and a handful of Cornell students. Demonstrators held their flaming cards high as crowds of onlookers clapped.

On March 8, 1967, antiwar activist David Harris and a group of his friends met in Palo Alto, California, and founded a group they called "The Resistance." They planned a series of demonstrations where young men could proclaim their independence and return their draft cards to the U.S. government. Across the country, activists opened local offices of the resistance and participated in the planning by recruiting draft resisters in their area. On October 3, 1967, more than 1,500 men returned their draft cards in the first "turn-in" demonstration planned by the Resistance. Two weeks later—October 17, 1967—3,000 protesters confronted a phalanx of club-wielding police in an antidraft protest at the Oakland induction center. The event, sponsored by several Bay Area antiwar organizations, quickly deteriorated into a violent melee, despite the efforts of Harris and other pacifists to keep it peaceful. Still, most antidraft protests remained nonviolent. Building on the success of its first "turn-in," the Resistance organized others, including one on December 4, where 475 participated, and April 3, 1968, which drew 630 draft resisters. David Harris ultimately went to prison for organizing the Resistance. Author Tom Wells noted that "the Resistance contributed to a grass-roots movement of more than half a million young men who violated Selective Service laws."

Thousands of draft resisters left the United States, settling in Sweden, Great Britain, Mexico, Canada, and elsewhere. The largest recipient of these young expatriates was Canada because culturally, it had much in common with the United States, and yet it provided a safe haven for young men fleeing the draft. During the Vietnam War, approximately 50,000 Americans—many young men and women opposed to the war—moved to Canada. In 1968, American draft resisters in Canada founded numerous antiwar organizations, the most influential being Amex, an antidraft organization. Amex published a newspaper of the same name, which went out to draft resisters across the country. The expanding Canadian anti–Vietnam War movement attracted numerous American expatriates, who brought a sense of urgency to planning protest activities. On college campuses from British Columbia to the maritime provinces, the new immigrants marched, spoke out, and organized.

Back in the United States, Dr. Curtis Tarr replaced General Hershey as head of Selective Service in 1969, and he looked for ways to quell the mass antidraft movement, as well as widespread allegations that the government was singling out the poor for the draft. He introduced a random lottery and scaled back de-

ferments, which Nixon ultimately revoked in 1971. By that time, however, the draft had slowed substantially, thus removing much of the wind from the sails of the antidraft movement.

GI's and Veterans

Reflecting the wider sentiments of the American public in 1965, most soldiers and veterans supported America's Vietnam policies. But a few bold ones turned against the war. In November 1966, Lieutenant Henry Howe was arrested and later court-martialed for attending an antiwar protest at Texas Western College. The following year, Captain Howard Levy, a U.S. Army physician, refused to train Special Forces medics bound for Vietnam. He was court-martialed and convicted, and served twenty-seven months in prison. In Fort Hood, Texas, three privates—Dennis Mora, James Johnson, and David Samas—refused orders to go to Vietnam in June 1966. "We want no part of the extermination," the so-called Fort Hood Three declared. Several antiwar activists came to the defense of Levy and the Fort Hood Three, planning demonstrations and generating much media attention. Like Captain Levy, the Fort Hood Three would each spend two years in prison. But their resistance emboldened the antiwar leaders, who were encouraged that dissent was finally making its way into the military.

Near military bases, activists opened up coffeehouses for antiwar GI's. In 1967, Fred Gardner, a reservist and former *Harvard Crimson* editor, opened the doors of the first GI coffeehouse, the UFO, in Columbia, South Carolina. He then traveled to Texas to open the Oleo Strut, a GI coffeehouse a few miles from Fort Hood. Despite harassment and persecution from military authorities and local police, nineteen coffeehouses were operating by 1970. Along with coffeehouses, GI underground newspapers helped spread antiwar sentiments through the military. GI activist David Cortright described the underground GI papers as "often short-lived and appearing in the form of barely readable mimeographed sheets." Two early GI underground papers were *FTA* at Fort Knox, Kentucky, and *Fatigue Press* at Fort Hood, Texas. Eventually, papers with such titles as *Open Sights*, *The Ally*, and *Left Face* could be found on military bases all over the United States and Vietnam.

Veterans also became involved in greater numbers as the war dragged on in Vietnam. In September 1965, U.S. Army Special Forces Sgt. Donald Duncan, who had trained soldiers in Vietnam, refused a promotion and resigned from the army to become involved with the antiwar movement. Duncan used his unique status as an ex–Green Beret to legitimize his resistance against the war. He became an editor at the radical periodical *Ramparts* and remained constantly in demand as a speaker at antiwar protests throughout the 1960s and 1970s.

In June 1967, six veterans who marched at the Spring Mobilization in New York founded Vietnam Veterans Against the War (VVAW). By the early 1970s, VVAW boasted 30,000 members, with chapters in every state of the union and Vietnam. The organization's first national demonstration, Operation RAW (Rapid American Withdrawal) in September 1970, was a highly publicized march of more than 150 Vietnam veterans from Morristown, New Jersey, to Valley Forge, Pennsylvania. VVAW conducted the Winter Soldier war crimes hearings in January and February 1971, attracting little media attention. But the organization next staged perhaps the most profoundly moving protest of the entire antiwar movement, Operation Dewey Canyon III (the title spoofed Operation Dewey Canyon II, code name for the U.S. military's "limited incursion" into Laos in February 1971). Well over a thousand veterans came to Washington, D.C., in April 1971 for a week of lobbying, guerrilla street theater, and marches. The week climaxed on Thursday with a powerful televised speech by VVAWer (and future U.S. senator) John Kerry, denouncing the war before the Senate Foreign Relations Committee. Then, the following day, Friday, April 23, 1971, perhaps as many as 1,500 veterans lined up on the steps of the nation's Capitol (surrounded by a makeshift wood and barbed-wire wall in preparation for the tumultuous upcoming May Day demonstrations). One by one, the veterans threw their medals, citations, ribbons, and other symbols of war, many of them making short and memorable statements, while network news cameras whirred and newspaper still cameras clicked. Images of the demonstration were played and replayed on television and in newspapers, searing it into the collective psyche of the American public.

The GI and veterans movement would flourish in the early 1970s, becoming arguably the most vibrant and active segment of the later antiwar movement. In June 1971, an alarmed Marine Corps Colonel Robert D. Heinl Jr. acknowledged in the respected *Armed Forces Journal* that the numerous GI and veterans protest movements had resulted in a crisis of morale in the U.S. military.

The Peak of the Antiwar Movement

The antiwar movement reached its zenith between 1968 and 1971. In these years, the movement had matured and had become increasingly decentralized. If the early years were characterized by national protests, planned by unified coalitions, in heavily populated cities such as New York, Washington, D.C., and San Francisco, the later years witnessed a more localized flowering of the movement, in communities across the country. This trend was accelerated by the fall 1969 Moratorium, a series of nationwide protests, some occurring in small towns in places like Kansas and Georgia, which had never had protests before.

1968

A year of trauma and upheaval, 1968 began with the Communist Tet Offensive in Vietnam at the end of January, and the intensity never subsided. The Tet Offensive was huge, as desperate North Vietnamese Army and Viet Cong soldiers battered virtually every major city and district capital in South Vietnam, surprising American commanders and their South Vietnamese allies. Like a sleeping giant suddenly awakened, U.S. forces struck back with unprecedented ferocity, pummeling rural and urban areas from the air and battling Communist forces on the ground. Scenes from the bloody battles—including unforgettable footage of South Vietnamese police chief

Nguyen Loc Loan assassinating a bound and unarmed Viet Cong prisoner—were played and replayed on American television sets. Most Americans had believed President Johnson's promises in late 1967 that the war was going in America's favor and would soon end. Although Tet ended in disaster for the Communists, it rattled the confidence of the American public and greatly enhanced the prestige of the antiwar movement.

But the assassinations of Reverend Dr. Martin Luther King Jr. in April and Senator Robert Kennedy in June (while campaigning for president on an antiwar platform) left the movement reeling and many activists dispirited. In April, radical students seized control of Columbia University in New York, which intensified the highly charged atmosphere. Many of the students were SDSers and outspoken antiwar militants. The tense takeover ended in late April when police forcefully evicted protesters from campus buildings, beating students and innocent bystanders in front of television cameras. As the mood of the country grew more polemical, a tiny but vocal minority of activists embraced violence and political extremism. These radicals had grown impatient with traditional methods of protest, which failed to reverse—much less end—the Vietnam War, and they vowed to "bring the war home." Beginning in 1968, militant revolutionary sects began attracting handfuls of antiwar activists. Between January 1969 and April 1970, 40,000 bombing incidents or bomb threats occurred, damaging $21 million in property and killing forty-three people. Police and federal agents never learned the identity of most of the perpetrators.

Demonstrations occurred frequently in 1968, but most of them remained peaceful. The antiwar movement reached a feverish climax in August in Chicago, during the Democratic National Convention. After the April 15, 1967, marches, the Spring Mobilization had again changed its name—this time to the National Mobilization Committee to End the War in Vietnam, or MOBE for short. The MOBE and several other organizations spent months planning protests for the Democratic National Convention, scheduled for August 21–26, 1968. Chicago's crusty mayor and political boss, Richard Daley, learned of the protests and responded by filling Chicago's streets with 12,000 uniformed and heavily armed police officers, and kept 6,000 Illinois National Guardsmen stationed nearby on standby. MOBE organizers Dave Dellinger, Tom Hayden, and Rennie Davis hoped the coalition would inspire antiwar Democrats to revolt against the prowar faction of the party, ideally in the streets. The Yippies planned a "Festival of Life," which they envisioned would include rock music, drugs, skinny dipping, and their own presidential candidate, a pig called "Pigasus."

Chicago 1968 assumed a historical significance beyond the actual events that occurred during the convention, due largely to the heavily televised drama coming out of the city each day. Delegates clashed with each other on the convention floor. At night, phalanxes of police, with clubs swinging, charged into crowds of taunting protesters. The streets were filled with smoke and blood. The Yippies' "Festival of Life" was poorly attended but heavily covered by the media. The MOBE's huge rally in Grant Park and many marches deteriorated into pandemonium. Young activists climbed atop statues and waved the National Liberation Front flag, provoking more police charges. True to their word, activists were bringing the war home, and in the process, the Democratic Party itself unraveled, shaking public confidence in the party's nominee, Hubert Humphrey.

After Richard Nixon's narrow presidential victory over Humphrey in November 1968, eight organizers of the Chicago Democratic National Convention protests were indicted on charges of conspiracy and crossing state lines with intent to commit riot. The trial of the Chicago Eight—later the Chicago Seven (defendant Bobby Seale was removed from the trial when he refused to cooperate, even after being bound and gagged)—proved to be heavily publicized high drama. Beginning in August 1969, the trial quickly deteriorated into a courtroom free-for-all, with the presiding judge, Julius Hoffman, exchanging insults and epithets with the defendants. The trial lasted four months. The seven defendants were found not guilty of conspiracy but were convicted of intent to riot and sentenced to five years in prison. A federal appeals court later overturned the charges against the defendants.

The Moratorium

The events in Chicago, coupled with Richard Nixon's victory in November, left many activists feeling dispirited and weary. Newly elected president Richard Nixon had promised that he had a "secret plan" to end the war in Vietnam, but he waited until July to reveal that he planned a gradual withdrawal of U.S. forces from Southeast Asia. During that time, movement activists regrouped and planned more events. After Chicago, antiwar activists worked tirelessly to mount the largest, most ambitious protest of the antiwar movement, the Moratorium. The head of the

National Guardsmen spray tear gas at antiwar demonstrators at Kent State University in Ohio, on May 4, 1970. The demonstration—sparked by President Richard Nixon's announcement that the Vietnam War would be expanded into Cambodia—led to the deadliest moment of the peace movement when Guardsmen opened fire on students, killing four and injuring nine. *(© Underwood Photo Archives, Inc.)*

Moratorium, Sam Brown, who had organized young volunteers for Senator Eugene McCarthy's 1968 presidential campaign, proposed a day of actions across the nation, where Americans took the day off school or work to protest the war. The Moratorium also drew support from the more radical wing of the peace movement. Co-sponsoring the fall events was the MOBE, by now re-christened "the New MOBE." The SWP-backed Student Mobilization Committee (SMC) also contributed significantly to organizing events around the country.

The October 15, 1969, Moratorium proved enormously successful. An estimated 2 million citizens participated in events across the country. They marched, listened to speeches, distributed pamphlets, read the names of Americans and Vietnamese killed in the war, showed films, attended church services, and conducted candlelight vigils. Church bells pealed for the dead. Millions of middle-class Americans who had never before protested in their lives wore black armbands to signify their unhappiness with the war. In Boston, more than 100,000 flooded the Common for the largest demonstration in that city's history. A second Moratorium in mid-November drew even more participants. During the groundswell of protest, newspapers across the country began publishing a series of reports, written by journalist Seymour Hersh, about a massacre in the Vietnamese hamlet of My Lai. On March 16, 1968—almost a year and a half before the story broke in America—Army Lt. William Calley Jr. and a number of his men herded 500 Vietnamese civilians together—men, women, and children—and systematically slaughtered them. My Lai fueled antiwar sentiment. So did a photo spread that fall in *Life* magazine, reminiscent of a high school yearbook, showing row after row of American soldiers killed in one week in Vietnam.

Cambodia and the War at Home

President Nixon was disturbed by the numerous media revelations about the conduct of the war throughout 1969. Particularly troubling to him was a story that first appeared in the *New York Times* in June reporting that the U.S. government was conducting a secret bombing campaign of Cambodia. Nixon had broadened the scope of the bombing to wipe out enemy sanctuaries in Cambodia and to destabilize the Communist Khmer Rouge guerrillas within its borders. At the end of April 1970, President Nixon made a televised speech announcing that he was sending American troops into Cambodia to destroy Vietnamese Communist positions in the country. The announcement immediately touched off a wave of protests at colleges and universities across the nation. Antiwar actions spread to 350 campuses, and some of them would remain closed for the rest of the year. On Monday, May 4, 1970—following a weekend of protest at Kent State University in Ohio, where an ROTC building was burned to the ground—Ohio National Guardsmen opened fire on a crowd of more than 1,000 students, killing four and injuring nine. Nine days later—on the evening of May 13—police opened fire on protesters at Jackson State in Mississippi, killing two students in the dorms. Both incidents, especially the more highly publicized Kent State, sent shock waves through the antiwar movement and undermined the momentum of the spring student strike movement. By the fall, most campuses would return to business as usual, but the traumatized nation would never be the same.

Locking arms in solidarity, veterans of the Vietnam War demonstrate on the steps of the Supreme Court Building in Washington, D.C., on April 22, 1971. The next day many publicly tossed away their war medals, a powerful symbolic action that galvanized the peace movement. *(© Underwood Photo Archives, Inc.)*

The Last Hurrah

The movement enjoyed a spectacular revival in the spring of 1971. A flurry of highly publicized protests occurred, starting in April, indicating the continued power of the antiwar movement. VVAW's "Operation Dewey Canyon III," a week of protest activity in Washington, D.C., April 19–23, 1971, involving more than a thousand Vietnam veterans, represented a huge coup for the movement. The medal-throwing ceremony on Friday, April 23, made countless headlines and dominated the network nightly news. The next day, April 24, between a half million and three quarters of a million people attended the largest demonstration in the history of the antiwar movement. A week later, thousands of protesters swept into the nation's capital for the May Day protests. During the numerous scattered actions, a record number of activists were arrested for civil disobedience. Crowds swept through the city, disrupting traffic, trashing neighborhoods, interrupting government offices, and generally wreaking havoc. Numerous scuffles broke out between police and demonstrators. On May 3 alone, Washington police arrested 7,000 people. Numerous other actions followed throughout 1971, with military and veteran dissent now dominating the antiwar agenda.

A powerful boost to the movement came in June 1971, when Defense Department "whiz kid" Daniel Ellsberg, onetime National Security Council operative, senior liaison officer to the U.S. Embassy in Vietnam, ex-Marine, and former Cold Warrior, leaked the Pentagon Papers to the *New York Times*. The Pentagon Papers, a forty-seven-volume, 7,000-page study of the Vietnam War (from 1945 to 1968) was commissioned by Secretary of Defense Robert McNamara. Compiling the study involved the combined efforts of thirty-six Defense Department analysts, including Ellsberg and Harvard professor and Defense Department of-

ficial Leslie Gelb. In addition to the *New York Times*, portions of the study appeared in the *Washington Post* and the *Boston Globe*. News of the released documents provoked a furor among conservatives who wanted to see Ellsberg convicted of treason, while antiwar activists felt vindicated by the findings of the massive study. The Pentagon Papers revealed a lengthy and systematic pattern of lies and deceit extending to the highest levels of government. The Justice Department tried to halt publication of the Pentagon Papers, and the leak upset President Nixon, who believed it would undermine his policymaking abilities in Vietnam. The leak prompted a secret organization called "the Plumbers"—a shady group of Nixon administration supporters sometimes called the Committee to Reelect the President (CREEP)—to break into the offices of Ellsberg's psychiatrist, Dr. Lewis Fielding, and steal Ellsberg's files. Nixon's obsession with leaks eventually led to the burglary at the Watergate office complex on June 17, 1972. Nixon's "plumbers" broke into the Democratic Party headquarters looking for files linking Democratic presidential candidate George McGovern with antiwar organizations and leaders. The burglars were caught, and slowly the extent of Nixon's involvement in the various break-ins, wiretaps, and other dirty tricks became known. The Impeach Nixon campaign of 1973 and 1974 grew largely out of the efforts of antiwar organizers.

Decline of the Antiwar Movement

When used to refer to the tumultuous protest movements of the period, the term "the 1960s" is a misnomer. Most of the protest movements of the era spilled into the 1970s, and the antiwar movement was no exception. It flourished until the early 1970s. Even throughout 1972, organizers could still mobilize significant demonstrations. At the Republican National Convention, thousands of protesters flooded into Miami to, as the posters for the event declared, "confront Nixon at Miami Beach." Various groups were busily planning a Counter-Inaugural demonstration, which occurred in Washington, D.C., on January 20, 1973, and attracted an impressive 100,000 participants. But the mass movement phase of the antiwar movement was effectively over after the 1973 Counter-Inaugural demonstration.

Decline did not come suddenly, and it occurred for many reasons. President Nixon's policy of "Vietnamization"—that is, replacing American combat forces with South Vietnamese soldiers—undermined the momentum of the movement. Gradually, Nixon withdrew U.S. forces while stepping up the air war. In June 1969, Nixon told Americans that he was withdrawing 25,000 of the 543,000 soldiers from Vietnam. The policy continued over the next few years, with painful slowness, but steadiness. Troop levels plummeted to 340,000 by the end of 1970 and then dropped to 156,000 at the beginning of 1972. By this time, most of the U.S. troops were used for support purposes, to bolster the vulnerable Army of the Republic of Vietnam (ARVN). Nixon continued the air war, pushing it to its most intense and concentrated extremes in 1972 and 1973, and pledged his support to the Thieu regime in South Vietnam. The Saigon government continued to enjoy billions of dollars in aid in 1973 and 1974, but because the flow of American body bags coming home from Vietnam had now slowed to almost a halt, antiwar sentiment ebbed substantially.

The gradual withdrawal of troops from Vietnam increased public confidence in Nixon so that the president enjoyed a hugely lopsided victory over his opponent, antiwar South Dakota Democrat George McGovern, in the 1972 presidential elections. In the fall, Nixon launched Operation Linebacker, an intense bombing campaign over North Vietnam designed to pressure the North Vietnamese to sign the Peace Accords in Paris. The bombing stirred antiwar sentiment around the world, including in the United States. The recently formed Indochina Peace Campaign (IPC), founded by Jane Fonda and Tom Hayden, lobbied and organized some effective antiwar campaigns. But when Vietnamese and American leaders put pen to paper at the Paris Agreements in January 1973, formally ending the war in Vietnam, they effectively eliminated the raison d'être of the antiwar movement. Many antiwar organizations folded immediately; a few held out until 1975. In sporadic, local actions, people gathered to protest U.S. aid to the Thieu regime in South Vietnam and to halt the bombing of Cambodia.

But the movement suffered even before the Paris Peace Accords. During the late 1960s and early 1970s, Nixon's paranoia, coupled with the repressive surveillance and harassment campaigns against the movement carried out by the Federal Bureau of Investigation (FBI) and other federal and local law agencies, had a chilling effect on dissent. The Internal Revenue Service audited prominent antiwar activists, the FBI sent undercover agents provocateurs into the movement to encourage violence, and federal agents tapped telephones, photographed participants, and hounded their families and places of employment. "The surveillance was far more extensive than generally known," noted historian Terry Anderson.

Sectarian infighting within the movement also contributed to its demise. In some cases, liberals and radicals could not work together. Other times, internecine battles erupted over such insignificant matters as appropriate slogans for marches, or the order of speakers at a rally. In the early 1970s, the national coalition split in two, at a time when unity was needed the most. The two organizations—the SWP-dominated National Peace Action Coalition (NPAC) and the radical pacifist People's Coalition for Peace and Justice (PCPJ)—were simply fragments of the once mighty MOBE. Extremist revolutionary sects—always infinitesimal in number—also damaged the movement's credibility. Marchers who insisted on carrying Viet Cong flags and chanting "Ho-Ho-Ho Chi Minh" hindered the movement's ability to reach out to a large segment of the American public.

Ultimately, however, the antiwar movement left a profoundly indelible impact on America. It changed Vietnam policy, limiting America's options and military involvement in Southeast Asia, as movement chroniclers Tom Wells, Melvin Small, Thomas Powers, and others have demonstrated. It introduced new forms of dissent into the arena of America democracy. An alliance of many different groups emerged and challenged the U.S. war effort in Vietnam, with a scope and tenacity unprecedented in the history of American social protest movements. It ushered in an epic struggle over what sort of nation the United States ought to be, and it inspired other protest efforts in the process. In the end, the efforts of countless antiwar activists—in thousands of different communities across the United States—diminished American militarism, while at the same time greatly enhanced the nation's democratic traditions.

Draft Resisters in Canada During the Vietnam War

One of the specters of the war in Vietnam and the attendant "War at Home" in the United States was the image of the young draft resister migrating to Canada to avoid military service. Throughout the late 1960s and early 1970s, the popular press was filled with stories about "draft dodgers" who had abandoned family, friends, and country for exile in the United States' northern neighbor. These press articles told a common tale of intergenerational rupture, separation, and estrangement generated by America's military involvement in Southeast Asia. Yet decades after the fall of Saigon, and President Jimmy Carter's 1977 blanket amnesty, the migration of thousands of young men, women, and families to Canada has become only a footnote in the history of the Vietnam era.

It is estimated that between 30,000 and 100,000 Americans went to Canada between 1965 and 1975. Sociologist Renee Kasinsky puts the figure at 40,000 based on her estimates of the number of draft-aged American males who entered Canada as landed immigrants between 1965 and 1975. This number, however, tells only part of the story. Along with the draft-aged men went thousands of women who made the journey into exile as girl friends, wives, and as expatriates in their own right, with their own political reasons for migrating. Determining how many Americans stayed in Canada after the granting of amnesty in 1977 is even more difficult than calculating how many made the initial move across the border.

Going to Canada did not endear draft resisters to the organized movement against the draft in the United States. The leadership of the so-called Resistance articulated a strategy of noncompliance and noncooperation with the Selective Service and local draft boards. In their view, massive civil disobedience would force the government to take an even harder line against draft resisters, in effect criminalizing an entire generation of young American men. This in turn would create a moral and political crisis, which would make the continuance of the draft impossible. Noncooperation was a strategy that demanded all draft-aged men risk criminal prosecution and imprisonment. Making the journey across the border was a rejection of this strategy. The young men who came to Canada did so for many different reasons; some went as a political act, some because they did not want to go to jail, others because it just seemed like the easiest way to avoid military service. Although the reasons for coming to Canada were subjective, many resisters felt that crossing the border was a way of rejecting the United States, American imperialism, and the corrosive political and cultural climate of the late 1960s.

For the Canadian government, the migration of thousands of young, middle-class, and educated draft resisters was a windfall. Draft resisters, after all, were the very type of immigrant that the Canadian government deemed ideal for its increasingly communications- and technology-oriented society. In addition, the government reaped an important symbolic benefit in allowing draft resisters entry in that it demonstrated Canadian independence from the United States, and by default, opposition to the war in Vietnam. This independence had its limits, however, as the Royal Canadian Mounted Police monitored and shared intelligence on draft resisters with the Federal Bureau of Investigation in the United States. Nor were all young Americans resisting U.S. militarism afforded easy entry into Canada. U.S. deserters, many who were working-class, African American, or who had little or no postsecondary education did not experience a warm welcome. In many cases, their status was in doubt, and on numerous occasions border officials actively sought to deny deserters entry.

The antidraft movement in Canada emerged out of the nascent student movement and as such was part of the Canadian New Left. The Student Union

for Peace Action (SUPA), a broadly based student group in the tradition of the Students for a Democratic Society (SDS), was among the first Canadian groups to offer aid and assistance to the growing numbers of young Americans who were drifting across the border to avoid the Selective Service draft. In 1966, SUPA produced the first pamphlet, *Escape to Freedom,* written by draft-resister Richard Paterak, that gave advice to Americans interested in coming to Canada. In addition to publishing the pamphlet and distributing it in the United States through SDS chapters, SUPA made room in their offices to counsel and support the growing numbers of young Americans arriving in Toronto. Another draft resister, Mark Satin, was hired to coordinate SUPA's antidraft program and to develop more comprehensive information on the practical and legal aspects of migration to Canada. Along with other SUPA staff in 1967, Satin compiled *The Manual for Draft-Age Immigration into Canada*, a book that would become the bible for thousands of Americans who made the move north.

SUPA's initial antidraft efforts would also grow and expand, becoming a separate organization, the Toronto Anti-Draft Programme (TADP), in late 1966. TADP would be the largest and longest lasting of the antidraft organizations in Canada. Over the years, it would offer draft resisters and deserters from the U.S. military assistance in finding housing, employment, and help in adjusting to life in a foreign, if relatively familiar, country. In addition to the TADP, many other groups aided draft resisters and military deserters. These included among others, the Union of American Exiles, the American Deserters Committee, the Montreal Council to Aid War Resisters, and Red, White and Black, to name only a few. Most major Canadian cities had at least one organization that provided assistance, support, and draft counseling to the steady flow of young Americans. In addition to the student movement, Canadian church groups were a major source of funding and volunteers for antidraft organizations. The Canadian Friends Committee (the Quakers), the United Church, Mennonite Central Committee, Canadian Council of Churches, and other religious groups were deeply involved in aiding resisters and working and supporting the peace movement in Canada.

Out of one of these resister organizations emerged *AMEX,* a newspaper dedicated to the political and social concerns of American expatriates in Canada. As a newspaper, *AMEX* followed in the tradition of the alternative and underground press of the late 1960s that provided a forum for debate, connections, and expressions of dissent rather than a pseudoprofessional journalism. In its early years of publication, *AMEX* argued that draft resisters should assimilate into Canadian society, that they should learn about Canadian history, read Canadian literature, and reject the American past. In tone and spirit, the contributors to *AMEX* were advocates of English Canadian Nationalism, a movement that sought to limit and reduce American political power and influence in Canada. For some draft resisters, Canadian Nationalism was an important vehicle to express opposition to U.S. imperialism and to make a political commitment to their homeland. Yet as the 1970s progressed, *AMEX* shifted its focus away from advocating assimilation into Canada to the campaign for amnesty in the United States. Long-time *AMEX* editor and pro-amnesty advocate Jack Colhoun, noted that the ascendancy of the pro-amnesty group within the newspaper was due in large part to the fact that the Canadian nationalist elements had drifted away from involvement in resistance politics to involvement in a range of other political activities.

As a group, the young Americans who came to Canada were participants in the larger youth and countercultures that blossomed in Canadian cities during the late 1960s and early 1970s. In Vancouver, draft resisters were a significant part of the hippie scene in the city's west end and artsy Kitsilano neighborhood. In Toronto, draft resisters were a significant presence at the Rochdale College, Toronto's experiment in alternative higher education, as well as in the bohemian neighborhood along Baldwin Street. As Americans settled in the social spaces of Canada's largest cities, they also became involved in a wide variety of political and cultural movements. American expatriates would play key roles in a wide variety of movements such as the Canadian labor movement, the women's movement, the urban reform movement, the lesbian and gay movement, and the alternative school movement. In some cases, these Americans brought with them activist politics honed on U.S. college campuses and through involvement in the civil rights movement and in antiwar activities during the 1960s. For others, however, coming to Canada was part of a process of politicalization that saw them become more active in causes and social movements as a result of leaving the United States.

The status of draft resister was resolved in 1977 when then-President Jimmy Carter provided a blanket amnesty, thus allowing American resisters to repatriate themselves. Though many resisters returned, thousands stayed behind, becoming a significant part of Canadian civil society over the last decades of the

twentieth and the first years of the twenty-first century.

Antiwar Movement
Twenty-First Century

In the aftermath of the terrorist attacks on the World Trade Center and the Pentagon on September 11, 2001, a new and vibrant antiwar movement took shape in the United States, protesting U.S. military intervention first in Afghanistan and then in Iraq. Unlike the movement against the Vietnam War in the 1960s and 1970s, the new antiwar movement was very diverse, bringing together people of all ages and a range of political viewpoints and affiliations. As renowned progressive analyst Noam Chomsky stated, "Antiwar opposition here has been completely without precedent in scale and commitment."

Compared with the antiwar movements of earlier decades, the movement of the early 2000s consolidated rapidly. Although the September 11 attacks and the resulting increase in nationalism and conservative sentiment temporarily sidetracked the global justice movement, the infrastructure developed by the movement laid the groundwork for much early antiwar organizing. Whereas the initial protests against the Vietnam War in the early 1960s drew at most hundreds of demonstrators and numbers did not reach the hundreds of thousands until the war was well under way, early twenty-first-century demonstrations drew hundreds of thousands in the United States and millions worldwide before the Iraq War of 2003 had begun. The protest movement against the Vietnam War developed over a period of more than a decade, while the Iraq antiwar movement emerged almost instantly. And it was not only activists who were moving at a more rapid pace. The active phase of the United States' military engagement lasted less than two months, given the government's understanding that the American people would no longer tolerate a long war involving multiple U.S. casualties.

Diverse Issues, Diverse Participation

As previously noted, the contemporary antiwar movement has brought together a wide range of participants, ranging from left organizations to global and social justice activists to moderates and even some conservatives. This classification is for discussion purposes only. Many individuals and groups belong to more than one coalition, and the major coalitions frequently endorse each other's actions and jointly sponsor demonstrations.

Cadre-Initiated Coalitions

As happened during the Vietnam War, some of the earliest opposition to the wars in Afghanistan and Iraq came from the far left and from those already heavily involved in activism. Left cadre organizations quickly drew upon their ability to rapidly mobilize members and widely publicize events. International Act Now to Stop War and End Racism (ANSWER) formed on September 14, just days after the terrorist attacks in New York City and Washington, D.C. While ANSWER is officially a coalition, including groups such as the Free Palestine Alliance, the Muslim Student Association of the U.S. and Canada, and the Kensington Welfare Rights Union, it is closely affiliated with the International Action Center (IAC) and the Workers World Party (WWP).

Not in Our Name (NION), a large coalition endorsed by many individuals and groups, is associated with Refuse and Resist, which in turn is affiliated with the Revolutionary Communist Party (RCP). Formed in March 2002, NION played a key role in antiwar organizing, especially on the East Coast, including a major demonstration on October 6 of that year. NION also initiated an antiwar statement signed by more than 100 celebrities, including Jane Fonda, Martin Luther King III, Tony Kushner, Gloria Steinem, and Alice Walker (published as an ad in the *New York Times,* the *Los Angeles Times,* and dozens of other papers), as well as a Pledge of Resistance reading in part: "Not in our name will you wage endless war; there can be no

Antiwar demonstrators near the United Nations in New York City were among the hundreds of thousands who gathered worldwide on February 15, 2003, to protest the threatened U.S. invasion of Iraq. *(AP Wide World Photos)*

more deaths, no more transfusions of blood for oil. . . . We pledge to make common cause with the people of the world to bring about justice, freedom and peace. Another world is possible and we pledge to make it real."

The International Socialist Organization (ISO) was heavily involved in mobilizing against U.S. intervention in Afghanistan in the wake of September 11 and—though not as visible as ANSWER or NION—continued to organize against the war in Iraq.

Global and Social Justice Activists

Although their decentralized, consensus-based process did not allow them to mobilize as quickly as ANSWER, local peace groups and global justice activists also began networking and organizing immediately after September 11. In New York City in particular, veteran activists and ordinary citizens (including family and friends of people killed in the World Trade Center attacks) came together to proclaim, "Our grief is not a cry for war." Utilizing electronic mailing lists, websites, independent media centers, and other infrastructure developed in the course of organizing against the World Trade Organization, the International Monetary Fund (IMF), and the World Bank, global justice activists mobilized large numbers of protesters in the United States and worldwide, forming antiwar groups in cities and towns across the country.

Although the large coalitions focused on mass rallies, many global and social justice activists favored direct action. Among the most active groups in this tradition were Direct Action to Stop the War (DASW) in the San Francisco Bay Area and the M27 Coalition in New York City. Many—but not all—direct action proponents identified politically as Anarchists or anti-authoritarians, and most mass protests included features familiar from global justice actions. These groups were organized on a consensus model, with no paid staff or formal fund-raising.

Peace and social justice organizers formed United for Peace and Justice (UPJ) in October 2002. According to the coalition's unity statement, UPJ opposes the Bush administration's "drive to expand U.S. control over other nations and strip us of our rights at home" and "its use of war and racism to concentrate power in the hands of the few, at home and abroad." The coalition includes activists working on human rights, feminist, antiracist, civil rights, environmental, and antipoverty issues. Although initially it was particularly strong in New York City, UPJ came to include more than 600 participating groups from around the country, including Black Voices for Peace, Global Exchange, and the Institute for Policy Studies. UPJ is more participatory and directly democratic than the cadre groups, and embraces multiple tactics. The coalition came to effectively occupy a "middle ground" between the cadre organizations and direct action proponents, and the more mainstream antiwar activists.

In addition, many preexisting organizations such as the War Resisters League, the American Friends Service Committee, and Veterans for Peace were active in organizing against the wars in Afghanistan and Iraq, often joining new coalitions such as UPJ. The National Network to End the War Against Iraq, a broad yet less widely known coalition comprised of some 150 peace and justice, student, and faith-based organizations throughout the country, was formed in 1999 to end "the illegal, unjust, and inhumane war being waged against the people of Iraq." Unlike the more moderate coalitions discussed below, the network opposed sanctions as well as military action, and multilateral as well as unilateral intervention. Similarly, Voices in the Wilderness, formed in 1996, also opposed sanctions against Iraq and in September 2002 organized an Iraq Peace Team to "witness, understand, and expose the situation of the civilian population of Iraq."

The Mainstream

As war with Iraq loomed closer, several progressive organizations and national advocacy groups came together in the fall of 2002 to form Keep America Safe: Win Without War (WWW), a coalition that explicitly spoke to the mainstream. Its members supported the U.S. government's goal of removing Saddam Hussein from power but favored sanctions, weapons inspections, and multinational efforts under the auspices of the United Nations rather than unilateral U.S. military intervention. "We are patriotic Americans who share the belief that Saddam Hussein cannot be allowed to possess weapons of mass destruction," read a WWW statement. "But we believe that a pre-emptive military invasion of Iraq will harm American national interests." Member groups ranged from progressive to conservative, but tended to be moderate liberals. Among these were the National Association for the Advancement of Colored People (NAACP), the National Council of Churches, the National Gay and Lesbian Task Force (NGLTF), the National Organization for Women (NOW), Physicians for Social Responsibility, the Sierra Club, and Working Assets. Among the more conservative was Business Leaders for Sensible Priorities, a group of Republican business executives who published an open letter to President Bush in the *Wall Street Journal* in January 2003 reading in part, "You are waltzing blindfolded into what may well be a catastrophe. . . . War is the most extreme action a society can take. It can only be unleashed after exploring every other road. You have not explored all the roads."

Religious activists of all denominations were well represented within the antiwar movement, many motivated by faith-based principles of nonviolence. Along with a range of traditionally liberal Christian groups, pagan activists (prominently represented in the global justice movement) were active participants. Muslim and Arab individuals and organizations joined antiwar coalitions in unprecedented numbers, responding to scapegoating and attacks on their civil liberties in the wake of September 11. Jewish activists—a traditionally progressive constituency—also opposed the war in Iraq but decried the anti-Semitism that developed among some factions of the antiwar movement as the issue of U.S. military intervention in the Middle East became linked with the Israel/Palestine conflict. While extremists on one side voiced frank hatred of Israel and the Jewish people, those on the other branded any criticism of the actions or policies of the Israel state as expressions of anti-Semitism.

Although activists have utilized computer networking for the past decade, the contemporary antiwar movement has witnessed the explosion of a new type of Internet-based organizing. The most prominent online organization is MoveOn.org, which was formed in September 1998 by Joan Blades and Wes Boyd, two Silicon Valley entrepreneurs seeking to oppose the impeachment of former president Bill Clinton. Relying on a network of some 2 million online activists worldwide, MoveOn seeks to "bring ordinary people back into politics," circumventing the in-

fluence of big money and big media. The group broadened its scope to include issues such as campaign finance reform, sensible energy policy, and judicial nominations. The MoveOn Peace campaign began as 911Peace.org, an online petition started by Eli Pariser calling for a peaceful response to the September 11 terrorist attacks. After the two efforts merged, MoveOn rapidly raised hundreds of thousands of dollars in small increments for antiwar television, radio, and billboard ads, coordinated some 6,000 candlelight vigils worldwide, and raised money for humanitarian relief in Iraq.

Labor

In contrast to its position during the Vietnam War, sections of the organized labor movement came out against unilateral U.S. military action in Iraq, forming U.S. Labor Against the War (USLAW). In part, this shift can be traced to organized labor's decreased faith in the federal government's willingness or ability to support a decent standard of living for working people. Following the lead of several local labor councils, in February 2003 the largest U.S.-organized labor federation, the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO), passed a statement opposing war in Iraq, claiming that President Bush had not made a compelling case for unilateral action against Saddam Hussein without the broad support of international allies. Various local unions were active participants in antiwar demonstrations, with teachers and healthcare workers, for example, protesting the vast amounts of money being spent on war rather than social services. Said USLAW's Bob Muehlenkamp, "Unions can no longer afford to talk about jobs and benefits without addressing issues of war and peace."

Students and Youth

Unlike the Vietnam War movement, which began (and is still often regarded) as largely a student and youth phenomenon, the contemporary antiwar movement is much more multigenerational. Yet university, community college, and high school students, as well as nonstudent youth activists, remained prominent participants. The National Student and Youth Peace Coalition organized a large antiwar rally in Washington, D.C., in April 2002. The Campus Antiwar Network was founded at two conferences in Washington, D.C., and San Francisco in January 2003 and soon counted members at more than 100 schools. Student global justice groups such as United Students Against Sweatshops (USAS) and Students Transforming and Resisting Corporations (STARC), emerging out of the resurgent student activism of the 1990s, saw resisting U.S. militarism as part of their global activist agenda. Campaigns to remove ROTC/JROTC and military recruiters from campuses—popular in the 1980s before the federal government passed legislation denying funding to schools that did not welcome the military—experienced a new revival.

Perhaps because of the lack of a draft and the greater economic challenges facing today's students, antiwar sentiment was not as widespread as it was during the Vietnam era. On some campuses there was a sort of role reversal, with professors—many of whom had been students themselves during the Vietnam War days—taking the lead in protesting the wars in Afghanistan and Iraq. The new movement included people of all ages, and media coverage of the mass protests in early 2003 often noted the participation of families with children, as well as older peace and social justice activists. Once the war in Iraq began in March 2003, the most prominent disruptions took place on the streets rather than on the campuses.

People of Color and Women

Although polls consistently showed that African Americans and Latinos were more likely to oppose war compared with whites, people of color have not been well represented at mass antiwar protests. Chicana activist Elizabeth (Betita) Martinez noted that people of color face more challenges to make ends meet and have more to lose when they protest government policies (especially if they are immigrants). Many activists of color felt that white activists failed to recognize and respond to the continuing war at home against communities of color, and some also criticized white antiwar activists for failing to take leadership from people of color. In addition, blacks make up a disproportionate share of people in the military, and some African Americans hesitated to appear as if they did not support U.S. troops. Even so, many people of color found ample reason to oppose war. In the words of former member of Congress Walter E. Fauntroy (D-DC), an African American, "We know that every bomb that explodes is robbing our children and their families of five things: income, education, health care, housing, and justice." In cities such as Washington, D.C., African-American groups, including Black Voices for Peace, played a prominent role in antiwar organizing. In Oakland, New York City, and elsewhere, youth of color were active in efforts to tie war abroad with social and economic justice struggles at home.

The contemporary antiwar movement is perhaps more demographically diverse than any other in our history, having benefited from identity-based organizing in the 1970s through the 1990s.

The current movement includes a roughly equal representation of women and men, and many even believe women make up a majority of its leadership. Nationwide polls taken during the run-up to the war in Iraq consistently showed that women were less likely than men to support military intervention. During the war in Afghanistan, some women were conflicted as the oppression of women under the Taliban

regime garnered widespread media attention. But by the time of the Iraq War, many women had taken the position that unilateral U.S. military action would not improve the lives of women and children in Iraq. Women have been active participants in all facets of the movement, and in addition some have formed women-focused groups such as CODEPINK: Women for Peace, a grassroots peace and social justice group seeking social change through creative protest and nonviolent direct action. Another woman-led effort, the Lysistrata Project, organized more than 700 readings in March 2003 of the Greek play by Aristophanes in which the women of Athens and Sparta withhold sex from their men until they make peace.

Cultural Voices

The Vietnam War protests initially were closely associated with the youth counterculture, but the contemporary antiwar movement is not linked to a specific cultural style. On the grassroots level, groups such as Art and Revolution and Reclaim the Streets—best known for their prominent role in the global justice movement—added music, art, and puppets to mass antiwar demonstrations. On the popular culture front, many musicians spoke out against the war in Iraq. Thurston Moore of the alternative rock group Sonic Youth developed an Internet website called Protest-records.com offering free downloads of antiwar songs. Musicians protesting the war encompassed all ages and many musical styles: Harry Belafonte, the Beastie Boys, Chumbawamba, Mos Def, Zack de la Rocha of Rage Against the Machine, Michael Franti and Spearhead, Lenny Kravitz, Cat Power, Boots Riley of the Coup, Pete Seeger, Russell Simmons, Bruce Springsteen, and Eddie Vedder of Pearl Jam. Perhaps most famously, Natalie Maines of the country rock band the Dixie Chicks ignited a storm of controversy when she told London concert-goers that she was em-

barrassed that President Bush hailed from her home state of Texas.

Actors Janeane Garofalo, Danny Glover, Dustin Hoffman, Edward Norton, Sean Penn, Tim Robbins, Susan Sarandon, and Martin Sheen spoke out against the war, in some cases risking their careers. The Baseball Hall of Fame canceled a ceremony celebrating the anniversary of Robbins's baseball movie, *Bull Durham*, while a United Way chapter in Tampa, Florida, scrapped a charity event featuring Sarandon after receiving complaints about her antiwar stance. Behind the cameras, directors Spike Lee and Martin Scorsese voiced their opposition to war, while iconoclast Michael Moore made antiwar comments during the Academy Awards ceremony. More than 100 musicians, actors, writers, and others joined Artists United to Win Without War (affiliated with WWW), which aims to encourage public debate and activate citizens through use of the media.

A Brief Chronology

In the days immediately following September 11, 2001, activists began to organize against anticipated U.S. retaliation against the Taliban, known sponsors of the Al-Qaeda terrorist network. ANSWER formed mere days after the terrorist attacks, as did local groups in several cities. Activists decried the U.S. rush to war as well as the crackdown on civil liberties at home (including the hastily passed USA PATRIOT Act, which, among other things, removes restrictions on wiretapping and online surveillance without probable cause), stepped up registration and detention of immigrants, and attacks against Arabs and Muslims. The first large antiwar protests took place in late September and October of that year. A march called by ANSWER on September 29 brought out an estimated 20,000 people in Washington, D.C., and 10,000 in San Francisco. Some 10,000 attended a protest organized by the New York Peace and Justice Coalition on October 7.

In April 2002, the National Student and Youth Peace Coalition and ANSWER both held rallies in Washington, D.C., coinciding with antiglobalization protests against the IMF and World Bank. The National Coalition for Peace and Justice and the Emergency National Network first came together for the D.C. demonstrations. ANSWER publicized its rally as a pro-Palestinian demonstration (following a recent Israeli incursion into the Jenin refugee camp and several West Bank towns), a focus the other groups declined to adopt.

As antiwar sentiment grew, more than 150 cities and towns passed antiwar resolutions. Although the movement experienced a lull in the summer of 2002, it quickly revived as the Bush administration threatened military intervention in Iraq. By the fall of 2002 and the winter of 2003, activists in the United States and around the world had mobilized antiwar demonstrations larger than any seen since the Vietnam era. On October 6, NION organized a massive rally in New York City, and protests occurred the same day in San Francisco, Seattle, Chicago, and dozens of other cities and towns.

ANSWER called another large demonstration in Washington, D.C., for October 26. Organizers estimated that 100,000 marched around the White House, while 50,000 demonstrated in San Francisco; protests also took place in Berlin, Rotterdam, Barcelona, and several cities in Italy. During the weekend of October 26 representatives from some 50 groups met and formed United for Peace and Justice. A subset of these organizers also started Win Without War.

In the early weeks of 2003, President Bush set firmer deadlines for Saddam Hussein to surrender weapons of mass destruction, and antiwar activists stepped up their organizing. Although the largest mass demonstrations took place in New York City, San Francisco, Washington, D.C., Boston, and Los Angeles, *War Times* newspaper reported antiwar activities in some 2,400 cities and towns across the country. On January 18 ANSWER sponsored a large rally in Washington, D.C., which brought out an estimated 125,000 protesters. A like number marched in San Francisco, and demonstrations also took place in numerous countries around the world, including Argentina, Canada, Egypt, Germany, Italy, Japan, Mexico, the Philippines, Russia, and the United Kingdom.

The most extensive international days of protest took place during February 14–16. In New York City police denied UPJ organizers a permit to march in Manhattan—a denial supported by the federal Department of Justice, citing security concerns. Nevertheless, on February 15 dozens of unpermitted "feeder" marches (among them students, people of color, LGBT people, performing artists, healthcare workers, and educators) departed from various points around the city to converge outside the United Nations for a rally estimated at up to half a million people; tens of thousands attempting to get to the rally site were corralled into pens of police barricades. Marches and rallies took place across the United States, including a rally of some 100,000 in Los An-

geles. The following day, ANSWER, NION, UPJ, and Bay Area United Against War jointly sponsored a march and rally in San Francisco (pushed back a day so as not to conflict with the traditional Chinese New Year's parade), which brought out as many as 250,000 people.

Internationally, 750,000 people rallied in London in what police said was the largest demonstration in British history. In Rome, 1 million demonstrators heard a communiqué from Mexico's Zapatistas read by the mother of Carlo Giuliani, a global justice activist killed by police during protests in Genoa in July 2001. "The attack on Iraq is just one page in the script of terror which the power of money has prepared for the entire planet," proclaimed the statement by Subcomandante Insurgente Marcos. "It is not justice, nor democracy, nor liberty which drives this terror. It is fear. Fear that the entire world will refuse to accept a policeman which tells it what it should do, how it should do it, and when it should do it. . . . Fear that the world will refuse to be treated like plunder. Fear of that human essence which is called rebellion. Fear that the millions of human beings who are mobilizing today throughout the world will be victorious in raising the cause of peace."

Elsewhere 500,000 demonstrated at the Brandenburg Gate in Berlin; 200,000 protested in Sydney; 70,000 turned out in Amsterdam; and 35,000 gathered in Stockholm. In Israel, 2,000 Israelis and Palestinians marched together in Tel Aviv, while 5,000 Turks in Istanbul demanded that their leaders not support the U.S. war, and protesters clashed with police in Athens. In all, an estimated 10 million to 30 million people demonstrated during the weekend in some 900 cities. Long-time antiwar protester David McReynolds said the demonstrations "exceeded anything I can recall in my 73 years," while the *New York Times* acknowledged that there were now two world superpowers: the United States and global public opinion.

Despite the outpouring of antiwar sentiment, President Bush declared that weapons inspections were not sufficient and that Saddam Hussein must abdicate power and leave Iraq. He made it clear that the United States was preparing to act with or without the support of the United Nations. In the run-up to war, activists in the United States and around the world increasingly turned to direct action. A notable example was the group of Westerners who traveled to Iraq to act as "human shields" in an attempt to stave off U.S. bombing.

A national antiwar student strike took place on March 5, with thousands of high school and college students from some 400 schools around the country walking out of class. On March 8 (International Women's Day), thousands of CODEPINK women protested in Washington, D.C., and twenty-five were arrested in front of the White House, ending a months-long peace vigil. In the days leading up to the war, eight antiwar protesters in Seattle were arrested for blocking a highway and disrupting the morning commute, while seven were arrested in Portland, Oregon, for blockading the city's federal building. In Chicago, eleven antiwar activists locked themselves together at the headquarters of Boeing to protest the corporation's production of equipment used by the military. Beginning in mid-March, San Francisco antiwar activists organized by Direct Action to Stop the War (DASW) blocked buildings and intersections in the city's financial district on several occasions, leading to dozens of arrests.

Antiwar protesters also took direct action in other countries. Two activists in Sydney, Australia, scaled the city's famous Opera House to paint "No War" on the building's white sails. Irish protesters painted peace signs on a U.S. navy plane at Shannon International Airport, while British activists repeatedly breached fences and damaged runways at air force bases. In Italy and Turkey antiwar activists blocked trains and trucks carrying U.S. military equipment. In Brazil, dock workers refused to load or unload U.S. and British ships for a day, and the Greenpeace ship *Rainbow Warrior* blockaded a section of a naval base in Spain to prevent a U.S. warship from leaving for the Persian Gulf.

Activists vowed to interrupt "business as usual" if war started, and when President Bush declared on March 19 that the "decapitation" bombing campaign had begun in Iraq, they made good on their pledge. On March 20, antiwar activists sprang into action, implementing the civil disobedience plans they had been formulating over the preceding months. Tens of thousands of protesters, largely mobilized by DASW, "called in sick" and shut down dozens of intersections and corporate, government, and media sites in downtown San Francisco, often locking themselves together to make it more difficult for police to remove them. "They succeeded this morning—they shut the city down," said one harried police chief. "They are moving faster than us. They're highly organized, but they are totally spontaneous." The decentralized, leaderless actions carried out by autonomous affinity groups

resulted in more than 2,000 arrests by the end of the week (although most of the charges were later dropped). In New York City, protesters laid down in Times Square. In Washington, D.C., protesters forced the closure of Potomac River crossings during the morning commute, while in Chicago they shut down Lake Shore Drive during the evening rush hour (resulting in some 500 arrests). Similar disruptions also took place in other cities, including Atlanta, Boston, and Philadelphia, in addition to numerous planned and spontaneous protest rallies from Bangor, Maine, to Fairbanks, Alaska.

Actions continued over the following days and weeks, along with more marches and rallies in numerous cities, including demonstrations by 20,000 in Los Angeles and a quarter million in New York City on March 22. On March 27, New York protesters mobilized by the M27 coalition (made up of members from some thirty-five progressive groups including UPJ) held a "die-in" on Fifth Avenue in front of Rockefeller Center in downtown Manhattan, resulting in some 200 arrests. Other decentralized affinity group actions took place that day throughout the city, including a "die-in" staged by CODEPINK in front of Tiffany's jewelry store and an occupation of the New York University student center.

By the end of March, activists had shifted their strategy away from disruption of traffic, instead focusing on corporations that stood to profit from the war (such as Bechtel, the Carlyle Group, Chevron-Texaco, and Halliburton), media outlets that uncritically supported President Bush's actions (including Fox News and Clear Channel Communications), and military facilities (such as Vandenberg Air Force Base and the Concord Naval Weapons Station, both in northern California).

On April 7, activists from DASW, in conjunction with members of the International Longshore and Warehouse Union, picketed at the Port of Oakland outside the terminals of American Presidential Lines and Stevedoring Services of America, which had received contracts to ship military supplies and run a port in Iraq. Police opened fire on protesters and longshoremen with rubber and wooden bullets and concussion grenades, injuring many and prompting lawsuits and calls for investigation of police misconduct (including one from Amnesty International). It proved to be, according to the *New York Times,* "the most violent [clash] between protesters and authorities anywhere in the country since the start of the war in Iraq."

Surrounded by body bags symbolizing the deaths of soldiers in the U.S.-Iraq War, Zoe Roller and Lola Basque lie down in a "die-in" in San Francisco on April 2, 2003. *(AP Wide World Photos)*

Antiwar protests continued throughout the spring and into the summer, although they grew smaller as the first phase of the war drew to a close. Rallies called by ANSWER in Washington, D.C., San Francisco, Seattle, and other cities on April 12, for example, drew a fraction of the crowds that came out in January and February. Once the war started, President Bush enjoyed an increase in support as the country experienced the common "rally 'round the flag" effect. Even many who opposed the war were concerned about appearing not to support U.S. troops, were pleased that the United States and Britain minimized civilian casualties, and wished for a quick end to the war. After Hussein's regime was toppled, President Bush declared victory on May 1, but U.S. troops continued to play a police role in the country as Iraqi

resistance continued, leading some to label the situation a quagmire in the making. With no weapons of mass destruction found, troop morale declining, and a few more U.S. soldiers being killed each week by Iraqi fighters, President Bush's approval rating slipped as the summer wore on, and there was increasing pressure to bring the troops home.

Causes and Conflicts

With the number of diverse participants comprising the contemporary antiwar movement, various conflicts have come to the fore. The chief causes of contention can be divided into two broad areas: disagreements over strategies and tactics, and debates about the scope of issues that should be part of the movement's agenda.

Organization and Tactics

The debate over tactics among antiwar activists echoed a common theme within the global justice movement, whereby moderate organizers expressed concerns that illegal direct actions (especially those that included property destruction) would discourage the involvement of mainstream participants, including organized labor and religious groups. The cadre groups, as well as moderate antiwar organizations like Win Without War and U.S. Labor Against War, favored large antiwar marches. Indeed, these mass protests were the most visible expressions of antiwar sentiment and provided an opportunity for participation by thousands of people who did not consider themselves "activists." But as President Bush pressed on with his plans for war in Iraq despite a huge international outpouring of dissent, many activists felt that marches and rallies were not enough. They began organizing direct actions aimed at stopping "business as usual," including traffic blockades and attempts to shut down military, corporate, and media targets. Moderate activists argued that this type of direct action alienated the mainstream, while the militants countered that it was necessary to "raise the stakes" and impose real costs on institutions that supported or stood to profit from war. After a round of disruptive direct actions in the days immediately preceding and following the start of the war in Iraq, however, even many radicals came to agree that traffic blockades were angering and alienating citizens (many of whom already opposed the war), and shifted toward more specific targets.

Another debate concerned the level of direct democracy in organizing and decision making. Grassroots activists (many coming out of the global justice movement) favored a more participatory, consensus-based organizing style. On the other side, cadre groups (in particular ANSWER but NION as well) were criticized for their centralized, top-down organizing methods and their lack of transparency. ANSWER was accused of attempting to impose other agendas on the antiwar movement, opportunistically using antiwar organizing to promote party-building, and taking credit for the efforts of other activists. In November 2001, the ISO was accused of attempting to "hijack" student antiwar organizing conferences in Berkeley, Boston, and Chicago. At the same time, large moderate coalitions such as WWW were criticized for relying on traditional top-down organizing, employing professional staff, and focusing on fund-raising, as well as relying too heavily on electoral politics.

The Antiwar Agenda

The diverse constituencies opposed to U.S. wars in Central Asia and the Middle East were motivated by myriad different causes, and many sought to include other issues in their antiwar organizing. Principled pacifists (including religious activists) opposed military intervention and its attendant carnage across the board, while many first-time protesters were motivated solely by opposition to the current war in Iraq. But more seasoned activists coming from other movements typically felt that U.S. militarism was intrinsically connected to other causes they cared about.

In the months after September 11, 2001, the burgeoning antiwar movement broadly agreed on three major issues: stopping the outbreak of war, ending racial scapegoating of Arabs and Muslims, and opposing the crackdown on civil liberties in the United States. Many also added opposition to any U.S. intervention in the Middle East and support for Palestinian liberation, although these issues proved to be more contentious.

The cadre-initiated coalitions, ANSWER and NION, were subject to criticism for promoting an anti-imperialist line (along with less apparently relevant issues such as support for Mumia Abu-Jamal, a former Black Panther who was accused of killing a police officer and for appearing to be anti-American). Whereas Socialist and Communist cadre groups had played a major role in Vietnam-era organizing, many veteran activists recalled how interorganizational conflict over party lines had contributed to the demise of that movement. During the 1991 Persian Gulf War, too, the movement split over support for Hussein, promoted by the International Action Center (ANSWER's parent group). By the late 1990s, cadre-style

organizations had fallen out of favor among grassroots activists, and they were not key players in the global justice movement.

ANSWER had an excellent capacity for mass organizing and was able to activate many volunteers and mobilize huge numbers of people for major marches and rallies in Washington, D.C., New York City, and San Francisco. Many (perhaps most) who participated in antiwar demonstrations were not experienced activists and often knew little of the initiating organizations' background or affiliations—much less agreed with their party lines. Although some refused to participate in protests organized by ANSWER or NION, others felt it was important to support all antiwar protests, regardless of who initiated them. Many agreed with Bob Borosage, co-director of the Campaign for America's Future: "[H]istory shows that protests are organized first by militant, radical fringe parties and then get taken over by more centrist voices as the movement grows. They provide a vessel for people who want to protest."

In the fall of 2002, several critical articles appeared in the press, featuring both "red-baiting" from the right and accusations of authoritarianism from the left. Some argued that the movement would never grow and attract new participants as long as it was associated with extreme positions such as the IAC's support for Slobodan Milosevic and other dictators. (It should be noted, however, that even among the radical fringe there was minimal overt support for the Taliban or Saddam Hussein, comparable to the earlier antiwar movement's support for the Vietnamese National Liberation Front). Todd Gitlin, a former president of Students for a Democratic Society, called ANSWER's prominent role "a gigantic ruination for the antiwar movement," while *LA Weekly* editor Marc Cooper called on "more mature segments of the left" to "step into the forefront of the peace movement and displace those who can only see evil in America."

The cadre groups were not the only ones calling for broad opposition to U.S. imperialism and capitalism. In fact, Anarchists demanded "No war between nations, No peace between classes." The revolutionary wing of the antiwar movement argued that war in Iraq was a first step in the consolidation of the U.S. role as the world's sole superpower, exemplified by the new National Security strategy's "preemptive" strike policy announced by President Bush in September 2002. Such concerns were strengthened by mounting U.S. threats against Syria, Iran, and North Korea. For global justice activists, opposition to U.S. militarism dovetailed with their anticorporate and environmental agenda, especially the belief that war in the Middle East was spurred on largely by the desire for access to oil and lucrative rebuilding contracts for well-connected corporations.

Fearing that such a radical agenda would discourage labor, religious, and minority participation, moderate activists countered with attempts to promote the idea that "peace is patriotic." They emphasized that the majority of people who opposed the war were not anticapitalist, were concerned about terrorism, believed Hussein should be condemned and removed from power (albeit by means other than war), and did not see the United States as a bastion of evil.

While the ANSWER coalition remained small, United for Peace and Justice managed to bring together national organizations and local groups as divergent as Greenpeace and the National Council of Churches. "If we're going to be a force that needs to be listened to by our elected officials, by the media, by power, our movement needs to reflect the population," said UPJ organizer Leslie Cagan. "It needs to be large, it needs to include the people who could be described as mainstream—but that doesn't exclude the people who are sometimes thought of as the fringes."

Some feared that taking on other issues would alienate potential participants, whereas others found that just such a strategy was needed to mobilize underrepresented constituencies such as working people and people of color. Organizers condemned the scapegoating and racial profiling that took place in the wake of September 11, 2001, winning support from Arabs and Muslims. Some felt that President Bush was using fear of terrorism to consolidate power by cracking down on domestic dissent. Antiwar activists and others made connections between the exorbitant cost of war and the lack of financial support for social programs at home. Some went so far as to assert that President Bush was using the war to divert attention from shrinking civil liberties and a failing domestic economy. On tax day, April 15, rather than calling for yet another mass rally, UPJ called for a weekend of local actions, including teach-ins and nonviolent civil disobedience. "We think it's an appropriate time for the peace movement to start focusing on the social justice part of this war," said UPJ's Leslie Cagan. "Where is the money coming from?"

The Future

By the summer of 2003, the antiwar movement increasingly began to look inward and plan for its long-term future. Although activists were disappointed that the movement did not succeed in stopping the war in Iraq, they were encouraged that protests appeared to delay it and heartened by the resurgence of political activism. As military engagement dragged on, many believed that opposition would strengthen, and also emphasized the need to be prepared to counter further U.S. military interventions.

Although many single-issue antiwar protesters pulled back as the war wound down, long-term activists argued for broadening the movement's focus. DASW in San Francisco, comprised largely of global justice activists, expanded its goals to encompass uprooting the system behind the war in Iraq and "the war at home" (including racism, poverty, and corporate globalization), and creating socially just, directly democratic, ecological, peaceful alternatives. UPJ has also broadened its agenda to include global justice issues. However, it remains to be seen to what extent newly mobilized antiwar activists will move on to other issues once the war is over.

ANSWER held an antiwar meeting in May 2003 that drew 800 participants, while UPJ hosted its own organizing conference in June 2003, bringing together more than 500 attendees representing over 300 organizations. The UPJ conference adopted a new structure and put in place a steering committee made up of representatives from national and local antiwar groups (mandated to include a broad spectrum of social groups). Although friction between the major antiwar coalitions remains, activists will continue to come together to express opposition to the continued American military presence in Iraq and future U.S. wars, uniting behind the demand to "Bring the Troops Home Now." Indeed, coalition members and nonaligned activists frustrated with intramovement divisions and conflicting events have called on the large coalitions (in particular UPJ, ANSWER, NION, and USLAW) to find ways to work together.

Meanwhile, Win Without War and MoveOn largely turned their attention to the presidential and local legislative races. Electoral politics proved to be a point of contention among activists, with the more radical element arguing that politicians—Democrats included—cannot be relied upon to oppose war and crackdowns on civil liberties in the name of national security. In fact, only one member of the House of Representatives—Barbara Lee (D-CA), representing Berkeley and Oakland—voted against President Bush's resolution to use the military to pursue the War on Terrorism in the wake of September 11. As the 2004 presidential campaign heated up, several Democratic candidates including Carol Moseley Braun, Howard Dean, Dennis Kucinich, and Al Sharpton came out strongly against the war in Iraq, while the Green Party maintained its clear antiwar stance.

The ultimate duration and outcome of U.S. military intervention in Iraq remains uncertain. Yet it is clear that the contemporary antiwar movement remains active in its opposition to U.S. policy in the Middle East.

Radical and Poor People's Movements

Introduction

Poverty has been a feature of American life from colonial times to the present. So have the collective struggles of poor people to end their penury. From spontaneous and inchoate riots for bread in early colonial towns to well-organized and disciplined Unemployed Councils in the 1930s, poor people's efforts have taken many forms. Poor people have marched on City Hall and Washington, organized unions, rioted in the streets, sat in at lunch counters and government offices, created settlement houses, taken freedom rides, constructed activist organizations, and formed political parties. Sometimes, poor people's efforts have achieved groundbreaking reforms, such as the labor and antipoverty legislation of the New Deal and Great Society. At other times, poor people's activity has victimized racial and ethnic minorities, as in the riots against Catholics during the economic depression of 1857 or the Civil War draft riots that targeted African Americans. Whatever their form and content, the movements of poor people have demonstrated repeatedly that millions of Americans have been and remain excluded from their United States' unparalleled economic abundance, yet they refuse to accept their fate quietly.

The ebb and flow of poverty in the United States has followed both cyclical and secular trends. Panics, depressions, and recessions have increased the number of the poor, while booms and times of economic stability have pulled numerous people out of penury. In the longer run, industrialization and the penetration of the market economy into more and more aspects of life expanded inequalities of wealth and enlarged the pool of poor people during the nineteenth century. At the same time, industrialization and commercialization created the conditions for poverty's elimination, and the second half of the twentieth century saw an uneven decline in the number of poor people and proportion of this economic demographic in relation to the rich, in no small part due to the movements of poor people.

Movements against poverty have reflected the form they took. In the eighteenth and nineteenth centuries, poor people struggled against the impact of expanding markets. Poor farmers protested against high commodity prices, low crop prices, currency devaluations, railroad monopolies, land speculation, monopolistic grain elevators, usurious banks, debtors' prison, trusts, inattentive political parties, government inaction, and wealth inequality. Urban poor people protested against high prices, debtors' prison, trusts, inattentive political parties, government inaction, and wealth inequality; they also fought against high rents, low wages, long hours, dangerous working conditions, unemployment, and graft. Both urban and rural poor people fought for public education. Their movements included public protests of various kinds, marches, meetings, riots, initiative and referendum campaigns, and political parties. The outlook of most poor people's organizations in the eighteenth and nineteenth centuries was backward looking, focused on land redistribution as the key to poverty elimination, even among city dwellers. By the end of the nineteenth century, industrialization, urbanization, the commercialization of agriculture, and ubiquitous market relations had made land redistribution irrelevant for most poor people, even farmers. Instead, poor people focused their demands on various forms of government aid; the idea of the welfare state—a government that takes responsibility for the well-being of its citizens—was born. Poor people's movements from the late nineteenth century demanded that the government provide relief aid, tenement elimination and affordable housing, clean water, an end to child labor, unemployment insurance and workmen's compensation, public works to provide employment and services, a minimum wage, and work-hour limits. Later, child care, job training, public transportation, public investment, and universal healthcare were added to the list of demands. Many of these demands were met, as well as an expansion of political and

social rights, such as greater access to political participation and the end of racial, ethnic, and gender exclusion.

In addition to fighting poverty and its associated problems, poor Americans have had to struggle against a pernicious ideology that locates the cause of poverty in individual incapacities. Rather than understanding poverty as the result of social, political, and economic circumstances as well as individual effort, many Americans blame the victims. The poor, they say, are poor because they lack the moral and intellectual capacities to lift themselves out of poverty. In a society that glorifies wealth, poor people are stigmatized as unfit to enjoy the full benefits of citizenship. With few resources to court politicians, finding allies to build the political and cultural clout necessary to tilt public policy in their favor is extremely difficult. In addition, many poor people have accepted the dominant characterization that equates poverty with indolence, stupidity, and amorality. This ideological burden has constituted one of the greatest barriers to the mobilization of poor people. Overcoming it has required that poor people find a way to universalize their plight and put forth an argument based on identifiable rights—the right to a minimum wage or unemployment relief—to justify their demands and win sympathy from nonpoor Americans.

Poverty has been an equal opportunity scourge in America. Certain ethnic and racial groups, and women, have suffered disproportionately, but no group has completely escaped the ills of economic destitution. Despite the common notion that poor people are predominantly nonwhite, the bulk of the poverty-stricken has been and is, in fact, white. The movements of poor people have reflected the country's racial and ethnic diversity. Rarely, however, have racial and ethnic groups fought their poverty side by side. More often, movements against poverty have foundered on the shoals of racism and sexism. For a time, Southern black and white farmers fought together in the Populist Party, but the party eventually collapsed in a wave of racist reaction that perpetuated Jim Crow throughout the South. Communists were more successful in uniting black and white unemployed people in the 1930s, but black people were excluded from many of the New Deal programs aimed at eliminating poverty. Thus, for the most part, poor people's movements have been racially and ethnically exclusive.

Where they have not included people of color or ethnic minorities, white poor people's movements have at best ignored and at worst targeted them. For example, the Equal Rights Party in New York in the 1830s largely ignored African-American citizens in its antimonopoly campaigns against high prices, but later bread, meat, rent, and fuel rioters often attacked Catholics and African Americans who supposedly stole from white poor people. Never have the all-too-often spasms of violence against nonwhite people done anything to eliminate white people's poverty. The movements of poor people of color, on the other hand, have done much to improve the conditions of all Americans. These movements have usually been part of larger movements against exclusion from political, economic, and social participation. Puerto Ricans in the Young Lords in the 1960s fought police brutality, racist hiring practices, and poverty. The political mobilization of freed slaves after the Civil War led to the passage of the Fourteenth Amendment, expanding the rights of all Americans. The War on Poverty grew out of the civil rights movement of African Americans, but the massive elimination of poverty achieved by the program aided the poor of all races and ethnicities.

The achievements of poor people's movements are many, but so, too, are the failures. Despite the efforts of so many dedicated people for so long, poverty remains a serious problem in the United States. At the turn of the twenty-first century, it is a growing problem, made worse by the glorification of business and the increasing hostility to the welfare state. The poor of today do not suffer the same afflictions as the poor of a century ago. Still, the poor suffer not only deprivation and humiliation, but also disease, mental illness, and shorter life expectancy. If the past is any guide, the contradiction between America's abundance and the persistence of its poverty will revive poor people's movements. For while the past has proven that economic growth can reduce poverty, it has also demonstrated that only an organized political movement can eliminate it.

Aaron Brenner

Poor People's Movements

Perhaps the greatest truism in American history is that the United States from colonial times has been a very rich and abundant country with large numbers of poor people. During the 1700s and 1800s, the existence of an impoverished class was largely covered up in a popular ideology that glorified the prosperous, self-reliant "yeoman farmers" and enterprising mechanics, the democratic producing masses, and the independent, sober, and thrifty common man. Poor people's movements in the antebellum period both developed in response to the increase in economic insecurity and poverty that accompanied early industrialization and sought through land reform, free public education, and other reforms to make real the vision of a society where no one had to be poor.

Pre–Civil War Era

The antebellum history of indentured servitude and slavery went against the popular ideology of a middle class, as did the ravages of industrialization through the nineteenth century. Wealth in natural resources meant little for those without the tools or capital to make use of those resources. Antebellum movements of workers against imprisonment for debt, in support of "hard currency," and for free land often drew their support from those who found themselves paid in valueless currency, made to pay exorbitant rents in expanding urban areas, and beset by periodic economic crises, called depressions and recessions in the twentieth century, which sometimes drove them into destitution.

Cities like New York, whose population rose from 130,000 in 1820 to 1 million in 1860 and 4 million in 1900, became centers of the visible poor, living in slum neighborhoods that were repositories of periodic epidemics and rioting. With the disappearance of property qualifications for white male suffrage after the 1820s, political radicals sought to lead movements of the poor. One such movement was the Equal Rights Party, popularly called Locofocos, in New York, which campaigned on a program of antimonopoly price reductions of "bread, meat, rent and fuel" in the depression of 1837. Riots such as the Locofoco flour riot against high prices were common, although riots of the poor in the mid-nineteenth century often took the form of "native" Protestants attacking "immigrant" Catholics seen as taking jobs. Such riots fueled the anti-immigrant and anti-Catholic Know-Nothing movement of the 1850s, whose xenophobic anti-Catholic message became an important force in national politics by pitting nativist Protestant whites against new Catholic immigrants. The Know-Nothings briefly competed with the new antislavery reform-oriented Republican Party to challenge the Democrats before the Civil War.

The depression of 1857, which gave impetus to the Republicans, led to major slum riots in New York, a mass demonstration of the unemployed in front of the Wall Street Stock Exchange, attacks on police stations, and the use of U.S. Marines to oust rioters who had briefly occupied City Hall, demanding work and food.

The Civil War, which brought price inflation and conscription, also heightened strikes and riots among the poor, in both the Union and the Confederacy. In 1863, bread riots among the poor took place in the Confederate capital, Richmond, Virginia, and in Mobile, Alabama, along with antidraft riots in a number of Southern cities. Confederate law gave draft exemptions to large slaveholders.

In the more widely industrialized North, strikes of workers were common, and army troops were often used to suppress these strikes, particularly when they were against munitions or transportation facilities. Although these strikes cannot be seen as poor people's protests, they were responses to the forging of an industrial working class under wartime conditions and a harbinger of postwar labor struggles.

Civil War Draft Riot

Perhaps the most important riot of the poor in the nineteenth century, which highlighted the social and ethnic divisions of the American poor, was the New York City draft riot of 1863. Just as big slaveholders were exempt from the Confederate draft if they chose to be, wealthy men in the Republic could purchase an exemption for $300. In July 1863, shortly after the great Union victory at Gettysburg, a mob of predominantly Irish immigrant labors attacked the new army recruiting station in New York and went on to loot homes of the wealthy, and hunt and kill all free blacks they could find, sometimes hanging or burning the victims, sometimes drowning them in the Hudson and East rivers, until Union troops returning from Gettysburg suppressed the riot.

Smaller "draft" riots with a similar social composition took place in Boston, Newark, New Jersey, and other cities. Although the riots were spontaneous rather than inspired by Confederate agents, as many abolitionists and supporters of the Republic contended, they were essentially a "war of the poor against the poor." The spirit of these riots would reappear in the postbellum period in various ways, primarily in "race riots" of poor whites against blacks. In addition, the mobilization of poor white communities in Boston, Philadelphia, and other cities against school integration in the second half of the twentieth century reflected the hostility of the white working class toward desegregation in urban areas, while middle-class suburbanites retained racially segregated schools.

Industrialization and Working-Class Protest

The pattern of spontaneous strikes by workers and rioting among the poor continued in the postwar period, as rapid industrialization and mass immigration produced larger cities, slums, and depressions. In the long depression of the 1870s, the unemployed held demonstrations demanding relief in Chicago, New York, and other cities, and often joined solidarity demonstrations for strikes, most importantly in the Great Railroad Strike of 1877, the first nationwide industrial strike. During the depression, the press used the term *tramp* to demonize the wandering unemployed, and some handguns were advertised as "tramp specials." Widespread looting by the poor and armed clashes by workers with police and state militias followed until President Rutherford B. Hayes used federal troops, which had recently been withdrawn from the South, to suppress the strike.

Symbolically, Hayes's actions represented the abandonment of nearly 4 million impoverished former slaves in the South and the concentration of federal military force against workers and the poor in the North and marginalized native peoples in the West, who were soon to be in the "reservation stage" of Indian removal.

Many members of the working poor, especially women and immigrants, flocked to the Knights of Labor, which accepted unskilled workers, women, and minorities, in the postwar period. On May 1, 1886, a new labor organization, the American Federation of Labor (AFL), whose leaders were influenced by the growing European Socialist movement, called for strikes throughout the country in support of the eight-hour day, which the Knights also took up.

In solidarity with one of the strikes at the McCormick Harvester Company in Chicago, a large crowd of workers and the poor gathered on May 4, 1886, in Haymarket Square. When police marched against the demonstration, a bomb was hurled at them, and a bloody riot ensued. Eight organizers of the demonstration, who had no proven connection with the bomb thrower (who was never found), were tried for murder. Despite international protests that included English writers William Morris and George Bernard Shaw, four were executed. When the Illinois Supreme Court refused to hear the appeal of the eight Haymarket defendants, Shaw wrote with characteristic sarcasm, "If the world must lose eight of its people, it can better afford to lose eight members of the Illinois Supreme Court."

Poverty Reduction as a Social Cause

In 1886, Henry George, the author of *Progress and Poverty* (1879) (an enormously popular work that asked why there was so much more visible poverty in a period of unprecedented economic growth and technological advance), ran a strong race for mayor of New York, finishing second, ahead of Republican Theodore Roosevelt, as the candidate of New York's labor unions. In *Progress and Poverty* and in his subsequent career as a reformer, George saw mass poverty as the result of the huge increase in land values that accompanied an industrialization that compelled both workers and small businessmen to pay usurious rents to a class of landlords who produced nothing and invested in nothing productive. George's solution to poverty and inequality was a "single tax"—essentially a progressive tax on land—that would take away the

"unearned increment" that the marketplace had given landlords. With the proceeds from the single tax, George proposed to fund public works that would provide jobs for the unemployed and other social improvements.

Rural Poverty and the Populist Movement

The existence of mass urban poverty spawned a powerful literature in the 1880s and 1890s, both realist and utopian, including such works as William Dean Howells's *A Hazard of New Fortunes* (1890), Stephen Crane's *Maggie: A Girl of the Streets* (1893), Edward Bellamy's Socialist utopia, *Looking Backward* (1888), and Ignatius Donnelly's capitalist dystopia, *Caesar's Column* (1891). However, the most important political movement that arose in the period, Populism, addressed the rural social dislocation and poverty created by the new boom-bust national economy, which saw agricultural production expand enormously in response to greatly increased urban markets, the "transportation revolution" represented by the railroads, and great advances in agricultural technologies. However, farmers saw the prices of their crops drop while the costs of farm implements, transportation, and grain storage increased sharply, reducing large numbers to tenants and, in the South particularly, sharecroppers and farm laborers.

To fight against this downturn, western and southern farmers in the 1880s formed farmers' alliances, which attempted to form farm distribution cooperatives and crop insurance plans, and made various legislative proposals, including public ownership of railroads and grain storage facilities and currency expansion ("free silver") to assist debtors. The alliances sent thousands of circuit-riding lecturers through the countryside to mobilize farmers and were a movement much more of small indebted farmers fighting against a commercializing agriculture that drove them into debt than of those already poor. Nonetheless, the movement became the center for campaigns against monopoly, the trusts, and the banks.

The alliance campaigns were an important part of the background to passage of the Sherman Anti-Trust Act in 1890; however, the failure of the alliances to influence the Democratic and Republican parties through pressure-group politics led to the creation of the People's (Populist) Party at Omaha in 1892. The preamble to the party's platform, written by Ignatius Donnelly, summed up the rage of the new poor of industrial America: "We meet in the midst of a nation brought to the verge of moral, political, and material ruin . . . the newspapers are subsidized or muzzled; public opinion silenced; business prostrate, our homes covered with mortgages, labor impoverished, and the land concentrated in the hands of capitalists . . . the fruits of the toil of millions are boldly stolen to build up colossal fortunes. . . . From the same prolific womb of governmental injustice we breed two classes—paupers and millionaires."

Although the Populists' message appeared apocalyptic, the onset of major industrial depression in 1893 gave it great force. Unable to make much headway in the rapidly industrializing core regions of the country, the Northeast and the Mississippi Valley Middle West, the Populist Party gained power briefly in the 1890s in plains states like Kansas and mountain states like Colorado. In the South, where white farmers belonged to a Southern Alliance and blacks to a Colored Farmers' Alliance, Populists fought fierce battles against the post-Reconstruction Democratic Party, which represented the interests of landlord planters and merchants and cotton factors who held the notes of the tenants and croppers. In the South, the struggle between Populists and those they called Bourbon Democrats—the white upper class—assumed the character of an open class struggle, as the conservative Democrats used heightened racist appeals, mass disenfranchisement of blacks and, to a much lesser extent, poor whites, and outright terrorist violence to suppress the Populist movement. For the Populists, the plantation owners and farmer slaveholders controlling the Democratic Party were equivalent to the Bourbon kings and aristocrats ruling France before the French Revolution.

The Populists had few practical programs for northern labor and the urban poor beyond antimonopoly rhetoric and a call for greater democracy, thus limiting the possibility that they would become a mass Farmer-Labor party replacing one of the two major parties. The decision of party leaders to form a coalition with the Democrats in 1896, supporting the candidacy of William Jennings Bryan, who mixed Populist and evangelical rhetoric with a narrow focus on the Populist program of currency expansion, doomed the party in two ways. Bryan led the Populists down to defeat with him and coopted an important part of their style and in a watered-down form some of their issues. Repressed in the South, many Populists joined the Democrats, acquiescing in white supremacy and seeking to represent poor white interests in what was now a one-party region. In the West, some Populists became active in the new Socialist

LOOKING BACKWARD
EDWARD BELLAMY (1888)

Edward Bellamy, a nineteenth-century utopian Socialist, originally published Looking Backward, 2000–1887 *in 1888, from which the following passage is excerpted. The work predicts that in the future all of the world's social ills will be abolished, including war, class divisions, crime, and mental illness.*

As to the final outcome of the labor troubles, which was the phrase by which the movement I have described was most commonly referred to, the opinions of the people of my class differed according to individual temperament. The sanguine argued very forcibly that it was in the very nature of things impossible that the new hopes of the workingmen could be satisfied, simply because the world had not the wherewithal to satisfy them. It was only because the masses worked very hard and lived on short commons that the race did not starve outright, and no considerable improvement in their condition was possible while the world, as a whole, remained so poor. It was not the capitalists whom the laboring men were contending with, these maintained, but the iron-bound environment of humanity, and it was merely a question of the thickness of their skulls when they would discover the fact and make up their minds to endure what they could not cure.

The less sanguine admitted all this. Of course the workingmen's aspirations were impossible of fulfillment for natural reasons, but there were grounds to fear that they would not discover this fact until they had made a sad mess of society.

They had the votes and the power to do so if they pleased, and their leaders meant they should. Some of these desponding observers went so far as to predict an impending social cataclysm. Humanity, they argued, having climbed to the top round of the ladder of civilization, was about to take a header into chaos, after which it would doubtless pick itself up, turn round, and begin to climb again. Repeated experiences of this sort in historic and prehistoric times possibly accounted for the puzzling bumps on the human cranium. Human history, like all great movements, was cyclical, and returned to the point of beginning. The idea of indefinite progress in a right line was no chimera of the imagination, with no analogue in nature. The parabola of a comet was perhaps a yet better illustration of the career of humanity. Tending upward and sunward from the aphelion of barbarism, the race attained the perihelion of civilization only to plunge downward once more to its nether goal in the regions of chaos.

This, of course, was an extreme opinion, but I remember serious men among my acquaintances who, in discussing the signs of the times, adopted a very similar tone. It was no doubt the common opinion of thoughtful men that society was approaching a critical period which might result in great changes. The labor troubles, their causes, course, and cure, took lead of all other topics in the public prints, and in serious conversation.

The nervous tension of the public mind could not have been more strikingly illustrated than it was by the alarm resulting from the talk of a small band of men who called themselves anarchists, and proposed to terrify the American people into adopting their ideas by threats of violence, as if a mighty nation which had but just put down a rebellion of half its own numbers, in order to maintain its political system, were likely to adopt a new social system out of fear.

As one of the wealthy, with a large stake in the existing order of things, I naturally shared the apprehensions of my class. The particular grievance I had against the working classes at the time of which I write, on account of the effect of their strikes in postponing my wedded bliss, no doubt lent a special animosity to my feeling toward them.

Source: Edward Bellamy. *Looking Backward, 2000–1887* (Boston and New York: Houghton Mifflin, 1926).

movement, particularly after the formation of the Socialist Party of America (SPA) in 1901.

MOVEMENTS OF THE UNEMPLOYED

As the depression of the 1890s deepened in 1894, Jacob Coxey, a radical greenbacker and champion of public works for the unemployed, caught press attention by leading an "industrial army," a march of the unemployed from Ohio to Washington. Other "industrial armies" (the concept was derived from Bellamy's *Looking Backward*) also marched on Washington, including an army of Polish immigrants from Chicago. Often the armies were greeted enthusiastically by unionized workers, as was Coxey's at Homestead, Pennsylvania, scene of the great steel strike against Andrew Carnegie and his lieutenant Henry Clay Frick

two years before. But the marches also produced many clashes with local police, especially in the West, and often dissipated because of a combination of police harassment and lack of food and other provisions. Coxey, riding a white horse, made it to Washington and led his army of 500 strong to the capital steps, only to see the police break up his demonstration and arrest him for trespassing. Other industrial armies from around the country suffered similar fates when they reached Washington. In August 1894, police authorities destroyed Coxey's campsite, which served as the center for all the protests, driving away more than 1,200 demonstrators.

Although Coxey was vilified in the press and largely forgotten, his march would live on in the much larger Bonus March of World War I veterans in 1932, to which the Hoover administration would respond much as Grover Cleveland had in 1894. In addition, Coxey would outlive those who mocked him, passing away in 1951 at the age of 97 and contending with a great deal of justification that New Deal jobs programs like the Works Progress Administration (WPA), the Civilian Conservation Corps (CCC), and the National Youth Organization (NYO) had vindicated him.

Settlement House Movement

As the twentieth century dawned, both Socialists and non-Socialist reformers addressed the question of poverty. Although it could more accurately be seen as a movement for rather than of poor people, settlement houses in urban slum areas, of which Chicago's Hull House, founded by Jane Addams in 1889, became the best known, provided a variety of social and educational services for the immigrant poor while publicizing the misery of life in the sweatshops and tenements.

Jacob Riis's *How the Other Half Lives* (1890), which used the relatively new medium of photography to chronicle conditions among Lower East Side Jewish immigrants in the 1880s, helped to create a genre that would become a part of early twentieth-century exposé journalism. Popularly called muckraking, these photographic and journalistic profiles focused primarily on political and business corruption. Distinguished photographers Alfred Stieglitz and Lewis Hine would make urban poverty a major theme in their work. Hine particularly was involved in the National Child Labor Committee, which grew as the number of children engaged in work grew. In 1900, the U.S. Census showed that 1.7 million children worked in mills and other manufacturing installations. This was a conservative figure, for parents routinely lied about the ages of the children as reformers began to have some success in northern industrial states in enacting minimum age requirements for workers.

World War I and the Rise of Racism and Ethnocentrism

The pre–World War I era might best be called an era of the discovery of poverty. New "progressive" magazines with predominantly middle-class subscribers regularly gave their readers accounts of urban poverty that was often just one neighborhood and one economic crisis away. Traditionalists continued to blame poverty on the poor, claiming that it was the fault not of society or the nation's economic system but of poor people themselves that they were poor.

First, racism served as both an explanation of poverty and an ideology to oppress the poor. Mounting violence in the South against poor blacks both helped to consolidate the system of segregation and disenfranchisement in the wake of the defeat of populism and served as a foundation for racist ideology and practice throughout the nation. A new generation of southern politicians, simply called demagogues in the northern press, appealed to poor whites with a theatrical politics that mocked the wealthy and incited hatred and violence against blacks.

Politicians like Senator James Vardaman (D-MS), and later Senator Theodore Bilbo (D-MS) and Representative John Rankin (D-MS), Senator Ben "Pitchfork Ben" Tillman (D-SC), and later Senator Ellison DuRant Smith (D-SC) and Senator James Strom Thurmond (R-SC), Senator Hoke Smith (D-GA), former Populist leader Senator Tom Watson (D-GA), and later Georgia governors Eugene Tallmadge and Lester Maddox, preached a politics of inciting the "war of the poor against the poor" in which a huge increase in lynching and the nationally publicized Atlanta race riot of 1906 were the best-known early examples. The spread of lynch law to the North in 1909 led a group of white and black progressives and Socialists to found the National Association for the Advancement of Colored People (NAACP). Although the NAACP could not be considered a poor people's movement, it nevertheless sought to regain civil rights lost since the end of Reconstruction and to prevent further erosion of the rights of an impoverished people.

In the North, portrayals of the immigrant poor as violent criminals, Anarchists, and Communists served as the backlash against social reformers' attempt to

awaken a social conscience against poverty. The American Protective League lobbied for immigration restriction and encouraged the work of "scientific racists" who portrayed Italian, Greek, Slavic, and Jewish immigrants from Eastern and Southern Europe as genetically inferior to Northern Europeans and a menace to the nation's "racial stock" and future. President Woodrow Wilson, whose Democratic Party particularly depended on the votes of new immigrants, spoke disparagingly of "hyphenated Americans" (those who called themselves Irish-Americans, Italian-Americans, etc.), sought to extend segregation to federal offices following his election to the presidency, and praised the racist film *Birth of a Nation*, which glorified the Ku Klux Klan (KKK) of the Reconstruction period, when it was released in 1915.

World War I intensified these trends as conservatives called for 100 percent Americanism and expanded political attacks on progressives, Socialists, and the Industrial Workers of the World (IWW). Known as the Wobblies, the IWW was a revolutionary workers organization that organized lumberjacks, miners, garment workers, dockworkers, and other impoverished workers who were seeking to improve wages and working conditions. The KKK also revived and spread rapidly, in both the North and the South, after the war, feeding on the postwar red scare against Socialists, Anarchists, and members of the new Communist Party, as well as the wave of race riots against blacks, particularly returning servicemen, in what was called the red summer of 1919.

Poverty and Inequality in the Post–World War I Era

World War I stimulated a huge expansion of U.S. industry through the implementation of mass production technologies and electrification. The increase in wealth brought the growth of inequality, as the labor movement was thrown back from its wartime highs. For example, the Keating-Owen Child Labor Bill of 1916, outlawing child labor, was declared unconstitutional by the U.S. Supreme Court (*Hammer v. Dagenhart*, 1918), and the political climate glorified both business and pro-business governments, denounced Communists, and mocked prewar progressives as "tired radicals" whose criticisms of business had been proven wrong by history.

What followed heightened inequality and increased conflicts between whites and blacks, among Protestants, Catholics, and Jews, and between urban and rural populations, along with exacerbating the already deep divisions over social issues such as Prohibition, religion, and personal morality. With the American public deeply divided over social issues and participation in electoral politics declining, conservative Republican administrations were free to pursue policies summed up by President Calvin Coolidge's famous phrase, "the business of America is business. He, who builds a factory, builds a temple. He, who works there, worships there."

This rather religious vision of American public life that linked prosperity to capitalism remained axiomatic in American national politics. In his 1929 inaugural address, President Herbert Hoover issued a statement that his generation of Americans was closer to the eradication of poverty than any generation in history—a contention that would prove wildly erroneous just seven months later, when the stock market crash rapidly accelerated the decline of what was already a stagnating economy. The Hoover administration's commitment to business-as-usual politics intensified what was to become the worst industrial depression of modern history. In the process, the poor became more visible than at any time in U.S. history, constituting at best a large minority and at worst a substantial majority of the population.

Depression and the New Deal

The Great Depression saw a rediscovery of poverty and the creation for the first time in U.S. history of poor people's movements seeking to transform society. At the center of the movements was the Communist Party USA (CPUSA), which in the aftermath of the Russian Revolution represented a new leftist force in the United States, the Socialist Party of America, which under its new leader Norman Thomas remained a significant force, and various radical movements in rural areas drawing upon the experience of populism. Together, these movements influenced the government of Franklin D. Roosevelt, which, in 1932, proclaimed a "New Deal" for the "man at the bottom of the economic heap, to enact major social welfare legislation to provide protections for workers, the unemployed, and the poor generally." In short, the New Deal was a series of government-led economic and social programs created to jump-start the economy.

By the winter of 1930, demonstrations of the unemployed, sometimes spontaneous, often led by Communists and other radicals under such slogans as "Work or Wages" and "Fight—Don't Starve," broke out in front of city halls in Philadelphia, Cleveland, Los Angeles, and other cities. The Communist move-

ment globally declared March 6, 1930, International Unemployment Day, and tens of thousands participated in demonstrations in the United States. In New York, Boston, Milwaukee, and other cities, the demonstrations led to major clashes with the police. In the wake of the demonstrations, the press, which had been downplaying the economic crisis (the term *depression* was at first a euphemism for what had previously been called panics and crises), began to acknowledge the severity of the situation.

The Communist Party and the Poor

Following up on the success of the demonstrations, CPUSA activists organized unemployed councils throughout the country and established a loose national organization, Unemployed Councils USA. The councils organized local campaigns for increased relief and demonstrations against evictions, which often led to violent clashes with police, particularly when council members sought to block the evictions of African Americans in Chicago and other major cities. Nationally, the councils focused on petition drives for a practical reform, unemployment insurance, so much so that American Federation of Labor conservatives, in opposing old age pensions and unemployment insurance at the AFL's 1932 convention, mocked them as "Communist programs."

In response to the press's contention that "nobody was starving," the councils organized "hunger marches," the most famous of which led to a bloody clash with police at the Ford Motor Company at Dearborn, Michigan, in 1931. The following year, Angelo Herndon, a young African-American Communist, was arrested and charged with "attempting to incite insurrection" for leading a multiracial hunger march in Atlanta, Georgia, in 1932. Sentenced in 1933 to twenty years on a Georgia chain gang, Herndon became the focus for civil liberties agitation throughout the country. The result was a 5–4 decision by the U.S. Supreme Court in 1937, which was then retreating from its all-out opposition to New Deal labor and social legislation, which declared the Georgia anti-insurrection law unconstitutional.

Communist organizing among the poor and unemployed stirred others on the left. The Socialist Party, through the Socialist-led mass organization, the League for Industrial Democracy (LID), organized unemployed groups in Chicago, Baltimore, and other cities, often pursuing similar goals—that is, negotiating improved welfare conditions and an end to evictions—as the Communists did, but with less militant tactics. In 1935, Socialists under the leadership of David Lasser established a national organization of the unemployed, the Workers Alliance of America, which was to include many Communists in grassroots campaigns. In spite of the bitter rivalry between the Communist and Socialist parties, the Workers Alliance was to become a sort of informal union representing workers in the New Deal's WPA and a lobby for federal relief and other social programs for the poor.

Communists also sought to mobilize sharecroppers in the Deep South, establishing a Share Croppers Union in 1931, which built a base of strength among impoverished black sharecroppers in Alabama. Socialists organized a Southern Tenant Farmers Union (STFL) under the leadership of H.L. Mitchell, which mobilized predominantly white tenant farmers and fought to reform New Deal agricultural policies, which, given the influence of Southern Democrats, practically favored large landlords and commercial agriculture.

In 1935, left-leaning members of the Agricultural Adjustment Administration's (AAA) legal staff attempted to override the southern plantation owners' policy of replacing black sharecroppers with whites by issuing a ruling from Washington headquarters that the same people had to be kept on the land. In response to landlord policies of removing tenants and croppers along with the acreage reduction for which they received benefit payments, the AAA had issued an order (often violated) that, in order for benefit payments to be received, the same number of people had to be kept on the land. In order to remain in compliance, southern landlords then began to replace blacks with whites, sometimes at a smaller share than blacks had received.

Afraid to alienate powerful conservative forces, including the Southern Democrats and the Cotton Council of the South, AAA administrators fired rebellious legal staffers. Lee Pressman, one of these staffers, went on to become general counsel of the CIO and was regularly attacked by anti–New Deal and antilabor media as a Communist agent seeking to foment industrial strikes to advance Communist political agendas.

Communists also pioneered in campaigns to organize predominantly migrant workers in the Central Valley of California in the middle 1930s. One of these became the center of John Steinbeck's famous early novel, *In Dubious Battle* (1936), which was critical of the growers, the Communist organizers, and the political power structure. Subsequently, many of these Mexican-American migrant workers were replaced by poor white tenant farmers from Oklahoma and Ar-

kansas fleeing the dustbowl in the late 1930s. Their plight drew national attention in James Agee's nonfiction *Now Let Us Praise Famous Men* (1941), John Steinbeck's novel *The Grapes of Wrath* (1939), and the work of WPA photographers and became a symbol of poor people victimized by society.

Campaigning to organize tenants, sharecroppers, and migrant laborers, Communists faced violent repression and were on the whole unsuccessful. Yet, the party influenced subsequent New Deal legislation and provided an important precedent for the later United Farm Workers' union-organizing drives led by Cesar Chavez, which gained widespread public support and won some important victories in the 1960s and 1970s.

Labor Militancy

For a brief period, the struggles of the agricultural workers and the rural poor seemed to be advancing significantly when they were taken up by the left-leaning Food, Tobacco, and Agricultural Workers Union/CIO in the late 1930s. Although the union pursued far more moderate policies than the various sharecroppers' unions and farm labor organizers, it held out the possibility of bringing the substantial resources of the CIO to the task of organizing the rural poor. However, the postwar Taft-Hartley law encouraged national CIO leaders to abandon their southern organizing drive, purge their unions of Communists and other radicals, and expel unions whose members refused to go along with the purges.

Under such slogans as "organize the unorganized" and "black and white, unite and fight," Communist, Socialist, and other unemployed groups supported the strike wave that began in the summer of 1934 and served as a counterweight to employers who sought to use the unemployed as strikebreakers. The demonstrations of Communist-led unemployed councils and the mounting strikes led the National Council of Mayors in the fall of 1934 to call upon the Roosevelt administration to enact national welfare legislation.

Although the legislation would fall far short of what Communists, Socialists, and other militants had been calling for, it represented the most important and far-reaching social legislation in U.S. history. First, the WPA funded a wide variety of public works projects, providing millions of jobs to the unemployed. Conservatives in Congress triumphed by insisting that the WPA pay its workers low "security wages" rather than the prevailing wage in industry. Conservatives also restricted appropriations for the WPA and other New Deal agencies providing jobs (the Public Works Administration and the NYA, which provided both jobs and work study grants for youth), so that, at their peak, some New Deal jobs programs could not reach more than a third of the unemployed. Still, the programs both saved millions of people and enriched the country by building public hospitals, roads, and recreational facilities; establishing federal theater, arts, and music projects; and engaging in other activities for low-income people that private enterprise, even in prosperous times, had considered unprofitable.

The New Deal government saw these jobs programs as temporary. As a long-term solution to poverty, the administration enacted old age pension and unemployment insurance legislation, the latter particularly associated with the campaigns of the Communist-led unemployed councils in 1935. Defined as an attempt to expand the power of labor to confront powerful businesses and corporations and increase workers' purchasing power, the National Labor Relations Act of 1935, in large measure a response to the growing strike wave and the fears that Communist-influenced strikers might create a revolutionary situation if reforms were not enacted, established a National Labor Relations Board to supervise union elections and outlaw unfair labor practices. The Rural Electrification Administration (REA) was also established in 1935 to provide electricity for rural areas too poor to get power from private companies.

The Congress of Industrial Organizations and the Struggle for a Welfare State

In 1935, the formation of the Committee (later Congress) on Industrial Organizations ushered in the organization of large, inclusive industrial unions, including Steel Workers, Auto Workers, and Electrical Workers, who, unlike the AFL, strongly supported social welfare legislation for the working class and poor. President Roosevelt addressed these constituencies when he ran for reelection in 1936, denouncing the "economic royalists" of big business and the "nine old men" of the U.S. Supreme Court, and contrasting what his administration had done for the industrial workers and the poor with the Hoover administration's actions in 1932 and promising to do more.

Roosevelt's great victory further stimulated union-organizing drives, leading to the victory of the United Auto Workers (UAW) in the General Motors Sit-Down Strike in the winter of 1937 and the victory of the Steel Workers in gaining recognition from U.S.

Steel. Subsequent New Deal legislation helped to break down distinctions between urban and rural labor, employed and unemployed, and to establish in a rudimentary way what would later be called a welfare state. Legislation included the Bankhead-Jones Farm Tenant Act of 1937, which created the Farm Security Administration, providing loans for family farmers and establishing "sanitary camps" to protect migrant agricultural laborers from exploitation, as well as the Fair Labor Standards Act of 1938, which established minimum wages, established the forty-hour week, and outlawed child labor.

The administration's commitment in 1935 to provide federal aid for families with dependent children (the Depression had produced widespread desertion by male heads of households in a society that still placed large obstacles, in the best of times, to full-time women workers) and later to subsidize the poor with food vouchers redeemable at stores (the Food Stamp Plan, enacted in 1939) represented the triumph of both the labor and unemployed movements. Although the Depression was not over and unemployment never dropped below 10 percent until the United States approached entry into World War II, American financier Jay Gould's arrogant boast of the 1880s, "I can hire one half of the working class to kill the other half," had finally been shattered by a remarkable coalition of liberals and radicals, labor, and unemployed organizers.

After sixty years of defeats in major strikes, beginning with the railroad strike of 1877, industrial workers had won great victories in the late 1930s. After facing for that same period a Supreme Court and a federal judiciary that routinely declared unconstitutional minimum-wage laws, protective legislation for women, anti–child labor laws, and legislation regulating business on the principle of "freedom of contract," workers and the poor now began to see a judiciary willing to accept government legislation on their behalf.

Opposition to Welfare State Programs

A great backlash from business and conservative forces opposed efforts to build strong welfare state programs. The WPA was vilified as a center of waste and inefficiency, and the industrial unions were condemned as seedbeds of Communist revolution. An informal coalition of Republicans and Southern and other conservative Democrats came into existence by 1938 to oppose New Deal policies, and the recession of 1937–1938 increased their numbers in Congress.

Faced with a congressional committee system that gave great power to anti–New Deal Southern Democrats with seniority garnered from the fact that they did not have to run in competitive elections, Roosevelt made a limited and unsuccessful attempt to oppose anti–New Deal Democrats in the Democratic primaries of 1938. The press, which was overwhelmingly anti–New Deal, called Roosevelt's actions a "purge," comparing them with the great political purges sweeping the Soviet Union. Meanwhile, a member of the conservative coalition, Representative Martin Dies (D-TX), became the leader in 1938 of the new House Un-American Activities Committee, whose stock in trade from its inception was to strike at unions, New Deal agencies, and various advocacy groups as the "Trojan horse," to use Dies's phrase, of Soviet-directed Communist revolutionaries. Another prominent conservative, Senator Harry Byrd (D-VA), led a committee on government appropriations, popularly known as the "economy committee," which sought to expose waste and cut New Deal budgets. Conservative newspapers spread the story that high New Deal official and WPA administrator Harry Hopkins had said, "we will tax and tax, spend and spend, elect and elect," which Hopkins denied, but which became a mantra for conservatives who saw the New Deal as a machine taxing business and the productive middle and upper classes to support radical unions and bribe the undeserving poor to keep them in power.

Even before the U.S. rearmament program began, the conservative coalition scored its first important victory when it eliminated the WPA's federal theater project, which was accused of radical influences and mismanagement in 1939. Once the United States entered the war and Roosevelt, in a highly publicized speech, announced that "Dr. New Deal," necessary to fight the Depression, was now to be replaced by "Dr. Win the War," a politically strengthened congressional conservative coalition eliminated the WPA entirely, struck down the Farm Security Administration, and abolished the Food Stamp Plan (which would be resurrected in the 1960s) on the grounds that they were no longer needed. When the National Resources Planning Board, a major New Deal planning agency, came forward for proposals to establish a comprehensive postwar welfare state, focusing on publicly supported housing, education, transportation, and healthcare, the conservative coalition eliminated the appropriation for the board.

Roosevelt used a number of the board's recommendations to develop his goal for a "second bill of rights," stressing economic and social security, which

he ran on in 1944 and which the press dubbed the "Economic Bill of Rights." However, the increased strength of the conservative coalition, the effect of the war in stimulating a vast expansion of American big business, and the political unreliability of the Democratic Party to advance New Deal goals—represented by the influence of powerful Southern Democrats and urban machines much more interested in local patronage than in social policy—made the realization of these goals very unlikely. Roosevelt's acceptance of Harry Truman, a centrist machine Democrat from Missouri, as a replacement for Vice President Henry A. Wallace on the ticket in 1944 and Truman's accession to the presidency on Roosevelt's death as the war ended inaugurated a new postwar period of conservative politics in which organized labor was contained and the poor became largely invisible once more.

Civil Rights Movement and the War Against Poverty

The civil rights movement was to become the most important force in U.S. society opposing postwar developments. The civil rights movement was often led by middle-class-based groups, black southern ministers, the NAACP, and even more radical groups like the northern-based Congress of Racial Equality (CORE) and the Student Non-Violent Coordinating Committee (SNCC), whose leadership cadre came largely from college students, intellectuals, and professionals. In addition, the movement depended on hundreds of thousands of mostly poor African Americans in the South and many in the North for its achievements. Poor blacks, in the tradition of Mississippi sharecropper Fannie Lou Hamer, who was nearly murdered when she tried to register to vote in the early 1960s, became heroes and heroines of the struggle.

Initially, the developing Cold War political climate set back the struggle for civil rights, as political purges in the unions, arts, sciences, and professions, were spurred on by the Truman administration's establishment of an "Attorney General's list" of subversive organizations in 1947. The Taft-Hartley Act, passed in 1947, made all union officials sign an annual oath that they were not members of the Communist Party, spread through the country, leading to the expulsion of many of the most qualified union organizers. These policies generated a political climate that made advocacy of the rights of workers, the poor, and minorities open to charges of subversion and treason and eliminated many of those who had led the successful struggles for the poor in the 1930s from public life.

Henry Wallace's public career was destroyed by his Progressive Party presidential candidacy in 1948; moreover, his running mate, Senator Glen Taylor (D-ID), was hounded out of the Democratic Party and the Senate in the aftermath of the campaign. The Wallace campaign sought to revive New Deal policies and connect them with civil rights and anti–Cold War positions. Governor Strom Thurmond of South Carolina, candidate of the segregationist National States Rights Party, who ran for president in opposition to the Truman administration's attempt to appeal to African-American and New Deal voters by offering to advance civil rights, was welcomed back into the Democratic fold and became a major leader of southern segregationists in the U.S. Senate within a decade.

This move away from pro–civil rights positions continued in the Democratic Party during the Korean War as the Democrats watered down their party's civil rights plank in 1952 and presidential candidate Adlai Stevenson chose Senator John Sparkman (D-AL), a centrist on most domestic issues and a supporter of segregation, as his running mate

Although the Supreme Court's historic *Brown v. Board of Education* (1954) decision overturned the juridical basis of southern segregation and made the federal judiciary the principal governmental ally of the civil rights movement in subsequent struggles, it did not bring about school integration until a mass social movement developed. At Montgomery, Alabama, such a movement launched a boycott against the city's bus system, which lasted over a year, produced as its spokesman the Reverend Martin Luther King Jr., and resulted in a victory both in the courts and in the solidarity shown by the African-American population. At the time, the average annual income of black workers in Montgomery was less than $1,000, which made the great majority of those who participated in the bus boycott, laborers, domestics, and the children of laborers and domestics, very poor by U.S. government statistical definitions of poverty.

Indeed, local segregationist elites throughout the South formed White Citizens Councils, which sought to coerce blacks from supporting the civil rights movement by threatening them with loss of jobs and evictions. Ironically, the mechanization of southern agriculture was forcing more and more blacks out of the rural South and, given deeper discriminatory policies against them in southern industry, to the North, so that many poor rural southern blacks had very lit-

tle to lose, save their lives, which a revival and expansion of KKK activity put at risk.

On February 1, 1960, four black college students organized a sit-in at a Woolworth's lunch counter in Greensboro, North Carolina, which sparked a wave of sit-ins that spread to southern stores, movie theaters, churches, and public swimming pools, led to mass arrests by segregationist police, and ultimately involved more than 50,000 people. Although the leaders of the protests were clearly young middle-class activists, the majority of participants were drawn from the segregated black poor. From the sit-ins came a heightened emphasis on direct action and a new slogan, "freedom, now," which rejected the gradualism that both the Eisenhower administration and its Democratic opposition preached and the NAACP and the Urban League, the leading establishment civil rights organizations largely indifferent to the plight of the black poor, had accepted.

The sit-ins saw the creation of the SNCC, made up of militant black and white college students who would interact with hundreds of thousands of poor southern blacks in anti-segregation and community organizing drives and voter registration campaigns in the early 1960s. Initially founded as a support group for civil rights activity with connections to the old Socialist LID and the political action apparatus of the United Automobile Workers Union, the predominantly white and middle-class Students for a Democratic Society (SDS) worked with SNCC, had many members who held joint membership in both organizations, and took the experiences it garnered from the southern-based civil rights movement to create an Economic Research and Action Project (ERAP), which launched community-organizing projects among the urban poor in northern cities in 1964, developing concepts and tactics that would reappear in the Johnson administration's War on Poverty.

The southern civil rights movement, under the leadership of Dr. Martin Luther King Jr. and the Southern Christian Leadership Conference (SCLC), was attempting to mobilize poor people to fight a nonviolent war against a violent enemy. The campaign sought to turn national and international public opinion toward compelling the federal government to end a system of segregation that had, in principle, been illegal since the *Brown* decision. The civil rights movement launched a full-fledged boycott against discrimination in public accommodations and employment in a major southern city, the steel city of Birmingham, Alabama. In May 1963, thousands of blacks, mostly young and poor, demonstrated against police dogs, fire hoses, and police beatings, filling the jails and gaining national and global attention. The fact that there were many cities like Birmingham in both the North and the South, where minority workers were essential to the service and industrial economy, convinced northern business leaders to support legislation to end southern segregation.

Government Responses to the Civil Rights Movement

In the early 1960s, the Kennedy administration announced support of legislation to end segregation and sought to channel the energies of young civil rights activists into voter registration drives in the South. The Democratic Party expected this direction would work to its advantage, since segregationist Southern Democrats were now deserting the party in droves. With this in mind, it supported voter registration drives such as Mississippi Freedom Summer, which took place in 1964, after the assassination of President John F. Kennedy and after his successor, Lyndon Johnson, had enacted a comprehensive civil rights bill banning discrimination against minorities and women in public accommodations and employment.

Events in the Mississippi Freedom Summer, the brutal murder of three civil rights activists, two white and one black, further undermined the de facto system of disenfranchisement that had been in existence in much of the Deep South since the end of the nineteenth century. These events, along with the SCLC campaign in 1965 at Selma, Alabama, provided public support for passage of Lyndon Johnson's Voting Rights Act, which became the basis for the restoration to southern blacks of voting rights lost after Reconstruction.

The Great Society

The events of Mississippi Freedom Summer, the close cooperation among middle-class civil rights activists and the African-American poor, along with the realization that the Kennedy and Johnson administrations were using the activists as unsupported cannon fodder while they continued to negotiate with and reward southern segregationists, bred a deep anger and alienation. These feelings exploded when the National Democratic Party, at its Atlantic City Convention in August 1964, refused to seat a delegation from the integrated Mississippi Freedom Democratic Party, which the civil rights movement had created, over the segregationist regular Democratic Party.

As he prepared to run for the presidency in his own right, Lyndon Johnson had called for the creation in the United States of a "Great Society," a term he used in a speech at the University of Michigan commencement in the spring of 1964, which became a catchphrase for his administration. As an important part of the Great Society, Johnson called for "an unconditional War on Poverty." With establishment liberals like Johnson's running mate, Hubert Humphrey, beginning to use such terms as a "Marshall Plan" for the cities, Johnson in his inaugural address in January 1965 made the war on poverty a high priority, something that no one in American history had ever done, short of Franklin D. Roosevelt's call for a New Deal and his commitment in his second inaugural to policies to elevate the suffering of "one third of the national, ill-housed, ill-clothed, and ill-fed." Never before in U.S. history had the question of poverty and the poor been broached in this way.

In 1964, Johnson had established an Office of Economic Opportunity (OEO) under the leadership of Sargent Shriver, brother-in-law of the late John F. Kennedy, to direct an antipoverty campaign. Kennedy had raised the issues of poverty and hunger in the 1960 campaign, focusing his attention on the white rural poor of Appalachia. Although conservative Senator Barry Goldwater (R-AZ) joked that most of the millions whom Kennedy claimed were going hungry were on diets, Kennedy did try to extend benefits under the existing, federally supported Aid to Families with Dependent Children (AFDC) welfare system, whose numbers began to grow sharply as the urban poor suffered from suburbanization, "urban renewal," declining public transportation and education systems, and the export of jobs to Taft-Hartley "right to work" states and suburban areas.

In addition, the civil rights movement, which focused on employment issues, in both the North and the South, had connected the campaign against segregation with the struggle against poverty, a point made clear by the 1963 March on Washington, whose official slogan was "Jobs and Freedom."

Building on modest Kennedy administration policies like the Manpower Development and Training Act (1962) and the Community Mental Health Centers Act (1963), which in a limited way established job training and expanded social work services for the poor, the Johnson administration in 1965 in effect created a series of new programs whose purpose was to provide education, healthcare, housing subsidies, job training, everything, as critics on the left noted, but the jobs themselves, to the poor.

The New Deal's food stamp plan was revived and in its early years expanded very liberally to a large number of low-income people, including college students. Although comprehensive national health insurance, which had come out of the New Deal's wartime program and Truman's 1948 presidential campaign, was not realized, the Johnson administration established Medicare, a Social Security–style healthcare for retirees (whose out-of-pocket healthcare expenses had driven many below the poverty line), and a federal-state "Medicaid" program of public healthcare for the poor who passed a means test. The administration also established the Head Start program, providing educational and recreational programs for poor preschoolers, federally supported legal services to the poor, a "model cities" program for rehabilitation of slum areas, a Jobs Corps, along with a number of other job training programs, and a great increase in federal aid to education, some of it targeted to the poor, under the Elementary and Secondary Education Act of 1965 and the Higher Education Act of 1965.

The OEO sought to coordinate a number of these activities at the community level, seeking to ensure that the programs were both democratic and reflected the specific needs of communities through a policy of "maximum feasible participation," that is, the involvement of community activists and organizations in the development of antipoverty programs. As a result, community-based antipoverty organizations sprang up in urban areas throughout the country and became a battleground for a variety of radical activists and patronage-hungry politicians, many of whom were members of African-American and Latino minorities closed out by the existing political machines.

The escalation of the Vietnam War, however, would ultimately undermine the War on Poverty. Johnson, in spite of the enormous victory the liberal Democrats had won in the elections of 1964, which temporarily broke the veto power that the conservative coalition had over progressive initiatives since World War II, now found himself negotiating with his political opponents to limit funding for antipoverty and other Great Society programs in order to maintain congressional support for rapidly rising military expenditures.

The Johnson administration found that this strategy was untenable. The strongest supporters of its antipoverty program, both in mainstream politics and in the activist groups and community-based organizations, were also the strongest opponents of the Vietnam War, which increasingly became the great cause for a new center-left coalition of liberals and radicals.

The bitterest enemies of Johnson's antipoverty program and his administration generally were the most loyal supporters of the Vietnam War escalation, Cold War politics generally, and a social conservatism that demonized welfare and saw the social protest movements of the period as both subversive and perverse.

Unlike Roosevelt, who was able to disappoint radical activists on many issues and still maintain their loyalty and love, Johnson found himself by 1967 hated by the activists whose grassroots support was necessary to both mobilize the poor and educate workers and sections of the middle classes of the need to support a program as ambitious as the Great Society.

As a result, the urban poor experienced what might be seen as a revolution in rising expectations, as the antipoverty program, to take a phrase from one of its early Johnson administration critics, Daniel Patrick Moynihan, was both "oversold and underfunded." What the urban poor did learn by 1965 was that to put down Viet Cong insurgencies against the South Vietnamese and American troops and fight a containment war, the administration was ready to spend very big money. Beginning with the Los Angeles Watts riot of 1965 and continuing in major urban ghetto riots in Detroit and Newark, New Jersey, in 1967, slum dwellers launched their own insurgencies against slumlords, tenements, unsanitary conditions, price-gouging storekeepers selling inferior products, and the long hot summer of life in the ghetto. In the short run, money did pour in to keep the peace, providing jobs particularly for unemployed youth, but the medium-term effects were to escalate white fears of northern urban black violence and to undermine the great success of the civil rights movement five years earlier in turning the violence of the segregationist white power structure against itself.

That these riots, suppressed by police and National Guard units, were not "race riots" in the American sense but, like nineteenth-century uprisings of the white poor, riots of the poor against poverty, meant little to many whites who associated poverty with blacks and were willing to listen to conservative politicians like Richard Nixon. Nixon began to revive his political career with calls for law and order in the streets, self-reliance and accountability among the poor, and the creation of an undefined program of "black capitalism" to replace Great Society programs that were fostering both dependency and unrealistic expectations that led to violence.

Actually, Great Society programs, when compared to New Deal programs, were fostering capitalism, though not necessarily minority capitalism. Storekeepers redeemed food stamps, housing developers were paid "market value" rent subsidies to build housing for the poor, universities and employers received generous government grants for their involvement in administration-supported education and job programs, and the officials of the local antipoverty agencies reaped the greatest benefits from the programs. The Johnson administration's siding with Democratic political machines against community activists helped to turn many community antipoverty agencies into corrupt political machines led by men whom the poor came derisively to call "poverty pimps." Most of all, the establishment of major social programs like Medicaid and section 8 housing benefits to the poor when they were not available to moderate- and low-income people above the poverty line bred resentment and divided lower-income groups.

Yet, by any statistical standard, the Great Society programs, given their limitations and the fact that an administration hostile to them took power in 1969, were remarkably successful in lowering the formal rates of poverty and providing through Affirmative Action–based education and employment programs a large expansion of African American and other minority middle classes.

As the Johnson administration retreated on the war on poverty in order to escalate the war in Vietnam, Martin Luther King Jr. became both an eloquent critic of the Vietnam War and a champion of a real War on Poverty. In 1966, King had led an unsuccessful campaign against de facto segregation and discrimination in Chicago, the leading industrial city of the North.

Here he had challenged the powerful political machine of Johnson's close ally, Mayor Richard J. Daley of Chicago, who used black ward healers in what was a much more sophisticated power structure. As his alienation from the administration and his fear of where the advocates of black power and violent confrontation were leading the country grew, King devoted his energies to building a poor people's movement, a broad coalition of poor whites, blacks, Latinos, Native Americans, Asian Americans, and others, and planned a great encampment of the poor, a nonviolent super version of Coxey's 1893 march and the 1932 Bonus March to revive the War on Poverty and in effect save the Great Society from itself in 1968.

It was in solidarity with this campaign that King went to Memphis to support a strike of black sanitation workers in April 1968. Following King's assassi-

nation in Memphis, riots of the black poor swept urban areas throughout the country and gave impetus to Nixon's emerging "law and order" presidential campaign. The assassination of Robert F. Kennedy in Los Angeles in June 1968, following his victory in the Democratic presidential primary, removed the only candidate with a program of uniting labor with white and minority low-income groups and youth, thus saving what he saw as his brother's domestic legacy from Lyndon Johnson, who had become his bitterest political enemy.

Kennedy had surprised many who had known him in Washington by his focus on the Bedford-Stuyvesant slum district of New York, his meetings with militant community activists, and his strong identification and support for Cesar Chavez and the United Farm Workers (UFW). As a senator from New York, Kennedy had also sought to expose the abuses against Native Americans, statistically the poorest group in the nation. At the time of his assassination, he had built a bond with poor blacks, Latinos, Native Americans, and others greater than his brother or any contemporary American politician.

Conservative Backlash

At the Republican National Convention in 1968, Nixon revealed his position on the ghetto riots by choosing Spiro T. Agnew, the governor of Maryland, as his running mate. Agnew was well known for ordering state police to shoot to kill when riots followed the King assassination and berating local civil rights leaders for failing to keep their people "in line." Just as Democrat Adlai Stevenson had called Nixon in 1952 a "white-collar McCarthy," to appeal to the anti-Communist hysteria during the Eisenhower administration, so Agnew was used by Nixon to appeal to those frightened by the ghetto riots and antiwar protests.

Whereas Franklin Roosevelt had appealed to the "forgotten man at the bottom of the economic heap" in 1932, Nixon appealed to a "silent majority" of law-abiding nonprotesters who had been abandoned by "limousine liberals" appealing to lawless elements. Songs like Merle Haggard's "Welfare Cadillac" captured the mood of what analysts called the "white backlash"; that is, the poor, meaning the nonwhite poor, were getting something for nothing at the expense of the hard-working middle classes. The demonstrations at the Democratic Convention in Chicago in August 1968, together with the ensuing massive police repression against the demonstrators, seemed to ensure the end of the Great Society and the defeat of Lyndon Johnson's hand-picked successor, Hubert Humphrey.

Nixon, however, would face great opposition from a wide variety of his opponents—civil rights activists, Great Society liberals, antiwar activists, feminists, environmentalists, and a growing welfare rights movement—leading to the initiation of conservative reform and unprecedented repression to defeat his real and perceived enemies and maintain his power.

Government Repression

The failed promises of the Great Society could be seen most forcefully in the activities of a group that the Nixon administration, through the Federal Bureau of Investigation (FBI) and its relationship with state and local police authorities, would search and destroy, the Black Panther Party. Founded in Oakland, California, in 1966 as a revolutionary black power organization, the Panthers, who denounced police brutality, bore arms, and called for the right of armed self-defense and self-determination for black ghettoes, functioned as the far left of the black power and community control movements of the late 1960s. Although they became the most important symbol of "black violence" for the mass media in the period, their political strength was based on practical social welfare programs that they organized for the poor in urban slum areas. These included free clinics, free breakfast programs for hungry children, alternative schools, voluntary sanitation projects, and militant protests against slum landlords and local storekeepers. The Black Panthers also became the model for a variety of other activists among the minority poor, particularly Mexican-American activists in the Southwest who formed the "Brown Berets" (the Panthers' informal uniform was a black beret and a black leather jacket) and the Young Lords Party, a Puerto Rican group.

Founded as a street gang in Chicago in the 1950s, the Young Lords transformed themselves into a militant group working among the Puerto Rican poor through contacts with Black Panther leaders in the mid-1960s. In New York City in particular, the Young Lords emerged as a significant force in protests against police brutality and in the creation of voluntarist social services for the poor. Less confrontational in their style than the Black Panthers, the Lords developed relationships with progressive Catholic clergy (as did the Panthers with some urban African-American ministers) and a number of individuals associated with the Lords, including Pablo Guzman, a young attorney for the New York chapter, Geraldo Ri-

vera, and Juan Gonzalez, went on to long-term careers in New York and national media.

The fate of the Black Panthers was to be quite different. In 1969, Chicago police raided Panther headquarters and killed Panther leaders Fred Hampton and Mark Clark on information provided by an FBI infiltrator, who had served as head of security for the Chicago Panthers. In Los Angeles, the FBI provoked an armed conflict between Black Panthers and members of a rival organization, the cultural nationalist organization US, led by Ron Karenga. Black Panther leader Bobby Seale was one of the leaders of the Chicago Democratic Convention demonstrations arrested by the Nixon administration and tried in federal court. Because of his protests, Seale was separated from the seven other defendants and bound and gagged. The national leadership of the Black Panther Party was regularly arrested, re-arrested when charges had to be dropped, and either given long prison sentences or forced to flee the country.

Many local leaders were also arrested, tried, and convicted on dubious charges. Others were killed in shootouts with the police, usually under very questionable conditions. By the early 1970s, the group had for all practical purposes been destroyed, although individuals in various parts of the country sought to keep its social welfare activities alive. Today Amnesty International and other international human rights organizations regard those Black Panther leaders who remain in U.S. jails as political prisoners.

Organizing Low-Wage Workers

A significantly more moderate movement of the working poor that enjoyed broad support among liberals and the general labor movement, the UFW under the leadership of Cesar Chavez sought to organize migrant farm workers, mostly Mexican Americans, who were at the very bottom of the economy in terms of incomes and benefits, in California and other parts of the country. The farm workers' grape strikes in California against Gallo Wine and lettuce strikes against Central Valley growers won the support of Senator Robert Kennedy, who brought his great celebrity and influence with liberals to the UFW. Eventually, large numbers were drawn to consumer boycotts and pickets against supermarkets and liquor stores that sold the products harvested by nonunion migrant labor.

After winning important victories in the late 1960s, the farm workers suffered significant defeats in the early 1970s when Teamster leader Frank Fitzsimmons, a Republican and strong supporter of the national Nixon administration and the local Reagan administration in California, joined with growers to launch raids against the UFW, sending goon squads into California to break UFW strikes. Local police and California State police, with the enthusiastic support of Governor Ronald Reagan, arrested many strikers. The election of liberal Democrat Edmond G. (Jerry) Brown as governor of California in 1974 led to significant reforms that partially revived the UFW, although the organization never regained what it had lost, nor did it recover its momentum from the late 1960s. Farm workers today remain generally nonunion and among the most exploited of America's working poor.

Welfare Rights Movement

Through the 1960s, Great Society programs and increased militancy among the poor led to a liberalization of the AFDC federal system, as the federal government encouraged states to provide access to benefits to larger numbers of people. Stirred also by Legal Services attorneys petitioning for such benefits and sociological studies that showed that large numbers of low-income people had been routinely denied benefits to which they were entitled, through a failure to inform them of such benefits, various bureaucratic subterfuges, or simply the social stigma of applying for "welfare," state and local authorities accepted higher numbers of applicants. Whereas only 55 percent of those who applied for welfare received benefits in 1960, the percentage had risen to 70 percent in 1968. Also, the number of applicants grew spectacularly. In 1960, 745,000 families had received benefits. By 1972, the number had risen to 3 million and federal payments for the program had grown from 1 billion in 1970 to 6 billion in 1972.

While this amounted to less than three months of Vietnam War spending, the numbers provided ammunition for conservative politicians, who blamed rising taxes on a corrupt welfare system.

The agitation of the late 1960s led to the formation of a National Welfare Rights Organization (NWRO), led by activists and academics who advocated a radical transformation of U.S. public policy for the poor. In early 1966, scholar activists Richard Cloward and Frances Fox Piven joined with George Wiley, a leader of CORE, and other antipoverty activists to found the NWRO, which they envisioned as a national organization that would provide leadership, strategies, and coordination for the struggles of the urban poor.

Led by civil rights veterans skilled in the tactics of nonviolent civil disobedience and dismayed by the nationalist and separatist currents developing in

Renowned scholar Frances Fox Piven was one of the founders of the National Welfare Rights Organization. She has written some of the most influential sociological works on poverty, the unemployed, and poor people's movements. *(Frances Fox Piven and Richard Cloward Archives)*

CORE, SNCC, and other civil rights groups, the NWRO developed a guerrilla war strategy of mass mobilization to disrupt public institutions (similar to the unemployed councils disruptions of city halls and welfare bureaus in the 1930s) to maximize political pressures through confrontations. Winning over and recruiting activists in existing antipoverty agencies, especially Volunteers in Service to America (VISTA), which was seen as a domestic Peace Corps, NWRO groups grew rapidly in the late 1960s and led welfare recipients in sit-ins and other protests against welfare offices, but dissipated quickly.

With an anti-organizational outlook similar to groups historically connected to Anarchist movements and an emphasis on relentless pressure-group politics to achieve reforms, the NWRO groups won many short-range victories in terms of expanding benefits for the poor but had no way to consolidate these victories. Campaigning successfully to educate the poor about "special grants" for supplementary benefits that often existed in the local welfare laws, the NWRO, after gaining many of these increased benefits for welfare recipients, saw welfare departments across the country eliminate them and replace them with flat grants.

Internal leadership conflicts between George Wiley and others over questions of strategy and organization further undermined the NWRO, as did its failure to develop effectively its coalition with the Southern Christian Leadership Conference's Poor People's Campaign, which continued with limited effect under Ralph Abernathy's leadership following the assassination of Martin Luther King Jr. The NWRO and welfare rights activists generally were also harmed by the anti-welfare rhetoric and policies of the Nixon administration, which expanded benefits for many Great Society programs benefiting middle-class groups while it sought to stigmatize the poor and abolish the OEO.

Under Nixon, the Department of Health, Education and Welfare (HEW) began to restrict or reverse rights that AFDC families had gained in regard to access to benefits and privacy protections. Conservative politicians, most notably Governor Reagan of California, whose state, together with New York, contained half of the nation's AFDC recipients, launched campaigns to purge the welfare rolls of "cheaters," introduced more stringent eligibility requirements, and reduced appropriations. In 1969, the Nixon administration itself proposed a far-reaching "welfare reform," to replace the AFDC system with a Family Assistance Plan (FAP), which would provide a minimum federal guaranteed income of $1,600 for a family of four (less than a third of what welfare rights activists regarded as a fair minimum income in most of the country).

Daniel Patrick Moynihan, a former Great Society official whose controversial 1965 report attributing poverty largely to the now discredited "social pathologies" of black families, departed the Johnson administration due to this and other criticisms of the Johnson antipoverty program. He later served as an adviser to the Nixon administration, which believed that increased welfare benefits produced greater numbers of dysfunctional families and would only increase expense and dependency rather than permit the poor to "reform" themselves.

Thus, the argument over "welfare reform" said that the existing system was "destroying" the poor by creating a "permanent underclass." The FAP received a wide variety of opposition from southern conservatives, who found the $1,600 standard too high and a potential threat to the southern low-wage structure.

On May 18, 1970, members of the National Welfare Rights Organization stormed the office of the U.S. Department of Health, Education and Welfare, which Secretary Robert Finch had abandoned. Such direct action aimed to raise welfare benefits and mobilize the poor. *(AP Wide World Photos)*

The program's defeat took place in an atmosphere of mounting political backlash against the "undeserving poor," who were increasingly seen as "welfare queens"—minority women bearing children for the sole purpose of gaining welfare benefits and living dissolute lives subsidized by the taxpayers. When George McGovern ran for president in 1972 with a commitment to provide a guaranteed annual income in the form of a "negative income tax" (cash payments of $1,000 per person to low-income people below a certain level, which would have eliminated the welfare bureaucracy and provided a higher level of support for the poor), the Nixon campaign accused him of threatening to place half the nation "on welfare."

As the Nixon administration found itself embroiled in the Watergate crisis after 1972, and the "stagflation" economy combined recession and inflation, the NWRO collapsed of its own internal and philosophical divisions, and movements of the poor, like all other social movements of the 1960s, save perhaps the environmental movement, found themselves in retreat. The huge inflationary wave of 1974 that followed the so-called energy crisis in the aftermath of the Arab-Israeli War of 1973 and the formation of the Organization of the Petroleum Exporting Countries (OPEC) led debt-ridden cities to launch draconian cutbacks of social services. The best example was the New York City fiscal crisis of 1975, which led to the creation of a dictatorial New York State Emergency Financial Control Board. The board fired

thousands of city employees and raised the cost of public transportation and access to various city facilities. Not only were the reforms advocated by welfare rights activists not instituted, but the value of public assistance payments to AFDC families in real dollars began to decline steeply from the early 1970s to the program's final elimination in 1996.

The 1950s and 1960s had been good times in terms of the national economy. The 1970s and 1980s were not. In spite of attempts to purge welfare rolls and restrict benefits, the "entitlements" under AFDC had seen the number of families rise from 3 million in 1973 to 11 million in 1980, of which 8 million were children.

Low-income women with dependent children found themselves the primary victims of the retreat from the Great Society and were now also blamed for the "welfare mess" as they sought to support children on reduced public assistance grants. Increasingly, two-income families struggled to keep their heads above water on the installment plan as inflation increased interest rates, while female pink-collar workers were in growing numbers compelled to live on public assistance.

The New Right and the Attack on the Poor

By the 1980s, liberal sociologists and some politicians began to write of the "hyper-segregation" of millions of marginalized minority poor living on public assistance in drug- and crime-infested slums without expectation or hope of ever working in the above-ground economy. Although these contentions were exaggerated in that the majority of the poor remained working poor and the majority of those on public assistance went in and out of employment with the vagaries of the economy and the limits of their skills, the crusade against welfare begun by conservative politicians in the 1970s and made into national policy by the Reagan administration greatly increased the hardships of low-income people. It did this primarily by freezing minimum wages, undermining unions, and eliminating housing subsidies, which created a mass homelessness problem for the first time since the Great Depression and generally made life for the bottom 20 percent of income earners far worse then it had been at any time in the post–World War II era.

In the Reagan years, the "new poor," were largely outside of the political process. The great majority were children, who, unlike the majority of low-income adults who do not vote, were not legally entitled to vote. Indeed, even such moderate political scientists as Walter Dean Burnham noted by the late 1970s that "the massive class skew in electoral participation which is America's chief peculiarity" was growing sharply. By contrast, in Italy, for example, a country with a very strong labor movement and a large working class, 75 percent of people with less than five years of formal education voted.

In the United States, the number was 8 percent. In West European countries, voter participation averaged in excess of 75 percent. In the United States except for presidential elections, the numbers were routinely well below 50 percent, with the nonvoting majority drawn overwhelmingly from low-income people. In the 1980s and 1990s, these trends would continue, producing presidential elections where around 50 percent of the eligible voters voted and off-year congressional elections where the numbers dropped below 40 percent. In state and local elections, the turnouts were even lower, creating elections where the top 20 percent of income earners often constituted a majority.

The top 20 percent of income earners, augmented by members of the religious and socially conservative New Right, constituted the core constituencies of the Reagan administration. The administration in its first term sharply reduced AFDC spending, at a time when the sharpest postwar recession created the highest unemployment since the Great Depression, threw more than 1 million people off AFDC rolls, and reduced benefits for many others. The Comprehensive Employment and Training Act (CETA) jobs program, which the Carter administration enacted in December 1973 to deal with mounting unemployment, was eliminated, removing public jobs for 300,000 people.

Huge tax cuts that benefited corporations, upper-income people, and, to a much lesser extent, moderate-income people, combined with a spectacular rise in military spending to produce runaway deficits, which made the United States, which had been the leading creditor nation of the world from 1919 to the 1980s, the leading debtor nation by 1985. In 1986, for example, the deficit was $283 billion, more than the total deficit had been at the end of World War II. Although unemployment subsided after 1982, and inflation by late 1970s standards was relatively low, nearly half the new jobs created paid wages that were below the poverty line for a family of four. Meanwhile, despite declining wages and the growth of poverty, the administration actively opposed public birth control policies and promoted the much ballyhooed revival of the male-headed nuclear family.

In this atmosphere, new advocacy groups for the

poor, especially the homeless, emerged, but no poor people's movement could or did exist where homelessness joined unemployment as a real menace for the working poor. An author rewriting Edward Bellamy's *Looking Backward*, a treatise on poverty in late-nineteenth-century America, at the end of the 1980s might come to the conclusion that the world of 1988 was actively trying to become the world of 1888. Homeless people were once more on the streets in significant numbers, and religious and secular groups were encouraged to develop food banks, shelters, and other voluntary programs to help them get on their feet. In New York City subways, some of the homeless even hawked a newspaper, *Homeless News*, filled with Horatio Alger and Social Darwinist solutions to their plight and chronicles of their success.

Scandals plagued a new generation of robber barons since they made their money largely through mergers and acquisitions, not through creating industrial corporations that produced goods. As forced urban gentrification drove large numbers of low-income people from rental apartments, the Reagan administration sold off or, in some highly publicized cases, leveled federally supported public housing complexes that it claimed were centers of drug addiction and crime. Urban development programs were reserved largely for the middle class, with federal and local government assistance. Meanwhile, local governments promoted expensive housing for affluent people and supported gentrification and commercial development projects in order to increase their tax base in response to federal government cutbacks.

Just as in the Progressive Era, the plight of children, who now constituted more than two-thirds of those officially poor, rather than child laborers as they had a century before, became a major cause for advocates of the poor. Marian Wright Edelman, leader of the Children's Defense Fund, sought to expose the size and effects of child poverty in the mass media and fight against Reagan and Bush administration policies in Congress and the courts.

Advocates for the homeless engaged in demonstrations, acts of guerrilla theater, and lobbying campaigns to increase welfare benefits for the homeless, improve and expand the capacity of public shelters, and, in cities like New York, restore the system of "welfare hotels," the elimination of which had thrown thousands of their inhabitants into the streets. Unlike the Communist movement–influenced unemployed councils of the 1930s or the civil rights movement–influenced welfare rights campaigns of the 1960s and 1970s, there were no movements involving masses of poor people, as conservative political forces sought to roll back the New Deal and what was left of the Great Society in the last two decades of the twentieth century.

Continued Attack Against the Poor: Routinization of Poverty and Inequality

As was true at the end of the nineteenth century, forces seeking to awaken a social conscience and institute reforms concerning poverty competed with anti-immigrant, openly racist groups who blamed economic inequality and stagnation on millions of new non-European immigrants, both documented and undocumented. Of the 20 million new immigrants entering the United States legally since the Hart-Celler Act of 1965 ended the quota system favoring Northern Europeans and largely excluding non-Europeans, about half migrated from Latin America and the Caribbean and a quarter from Africa, Asia, and the Near East.

In states like California, immigrants, both documented and undocumented, became scapegoats for conservative politicians who mounted "English-only" campaigns, opposed bilingual education, campaigned to remove all welfare benefits from undocumented immigrants, and campaigned to sharply restrict benefits for legal immigrants. Patrick Buchanan, a right-wing speech writer in the Nixon and Reagan administrations, made Latino immigrants a central feature in his declaration of a "culture war" against "multiculturalists," minority interest groups, and all others who were undermining the United States as a "European nation" and the principal guardian of Western civilization. In his speeches Buchanan singled out Latinos, saying that in California and the Southwest illegal immigrants named "José" (which he used as a generic epitaph) were taking jobs from American citizens. Buchanan also called for greatly increased border patrols and even suggested the possibility of building an electronic fence across the U.S.-Mexican border to thwart immigrants.

In 1994, anti-immigrant forces successfully passed in a state referendum Proposition 187 in California, which denied illegal immigrants and their children access to public assistance, public education, and healthcare. Calling itself Save Our State (SOS), the petition group, with the support of Governor Pete Wilson and much of the state's conservative Republican establishment, made racist appeals, accusing those who defended the rights of undocumented workers as aiding

and abetting an "illegal alien invasion" that threatened to turn California into a "Third World country."

Although the proposition was challenged in the courts and declared unconstitutional by the California State Supreme Court, the sweeping Republican victory in the 1994 congressional elections led to federal enactment of some of its major provisions. Passed by the Republican-dominated Congress, whose most important leader was the skilled conservative House Speaker Newt Gingrich, and signed into law by President Bill Clinton, the Illegal Immigration Reform and Immigrant Responsibility Act (1996) increased the border patrol, expanded Immigration and Naturalization Service (INS) powers to deport immigrants, and sharply increased penalties for illegal immigration.

The legislation upheld that the government would do everything in its power to keep undocumented immigrants out and restrict legal immigrants, but employers were minimally penalized. In fact, employers could report undocumented workers to the INS when they sought improved wages and working conditions.

Millions of low-income, minority, union, and liberal voters (the core groups of the Democratic Party since the 1930s) hoped that they had put an end to the Reagan-Bush era and its war against labor, civil rights, and the poor when they elected Bill Clinton to the presidency in 1992. Within two years, the Clinton administration sharply alienated these groups and opened the door to the restoration of long-term Republican control of Congress for the first time since the 1920s.

First, Clinton's much-trumpeted call for a national health system was defeated by Republicans in Congress with the support of the insurance companies that controlled the private managed care insurance system. Clinton's attempt to enact an economic stimulus package that would have aided labor and the poor was also defeated. As the administration went from one defeat to another, it was obvious that the president was not able to enact key legislation.

Dismantling the Welfare State

Clinton's failure to promote a progressive social agenda and his support of the North American Free Trade Agreement (NAFTA) created disillusionment and malaise both within the labor movement and among liberal Democrats. In a campaign filled with attacks on his administration, including references to White House corruption and sex scandals, the Republicans, issuing a conservative manifesto they called a "Contract with America," in 1994 regained control of both houses of Congress for the first time since 1954 in an election where 38 percent of the eligible voters went to the polls.

In his 1992 election campaign, Clinton had made the vague promise to "end welfare as we have known it." While many of those who voted for him assumed he meant a return to Great Society job training and education programs, along with a more tolerant approach to welfare recipients, none of this materialized in the first two years of his administration. When the Republican majority came forward with legislation to eliminate AFDC and put into law the view that welfare was itself a major social problem, not a solution to poverty, Clinton divided his own party and supported them. That the president was running for reelection in August of 1996, when the legislation was signed, may have explained his behavior.

Assaults on the welfare state had permeated the mass media since the Nixon administration, became national policy in the Reagan administration, and after a quarter of a century, served as conventional wisdom in U.S. politics. The poor were still the largest group of nonvoters, and children ineligible to vote were the majority of those receiving AFDC benefits. Also, Clinton knew that those most hostile to welfare reform would not vote against him and bring conservative Republican Bob Dole into the White House.

The term *welfare reform,* used by both the Republican majority and the Clinton administration, covered up what was essentially the first full-fledged removal of a major social guarantee of the New Deal era.

Minimum wages had been frozen in the Reagan-Bush era, but not abolished, as some conservatives had wished. Social Security and unemployment benefits had also been restricted but not eliminated. Unions were weakened tremendously, but the NLRB system remained in place against any attempt to revert to the antilabor abuses that were routine in the pre–New Deal era. Called the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA), the legislation eliminated the AFDC, with its "safety net" concept, and replaced it with a Temporary Assistance to Needy Families (TANF) program, which would provide block grants to states, with a five-year limitation on benefit payments to individuals.

Block grants were used widely in the Reagan administration to undermine federal social programs by both reducing their funding and turning over, in the

On March 23, 1995, police arrest antipoverty leaders—including National Organization for Women president Patricia Ireland (far right)—for protesting welfare reform proposals under consideration by Congress. The proposals were enacted into law in 1996. *(AP Wide World Photos)*

form of the grants, decisions as to the distribution of funds to state authorities. The PRWORA abandoned entirely in theory and practice the AFDC principle that public assistance was part of a "safety net" below which people would not be allowed to fall. The legislation made putting recipients to work as quickly as possible its highest principle, without regard to the value of the work or its effects on workers. Along with the five-year limitation on benefits, recipients were required to find some work within the first two years or lose support. Those who could not find work in the private sector were compelled to work in "workfare" programs for their benefits (without minimum wage protections) in public sector jobs, or be removed from the rolls. Previous rules, which allowed women receiving AFDC benefits to attend college, were removed and replaced with narrow vocational education.

While welfare rolls were reduced sharply to the delight of conservatives and the Clinton administration, researchers by the end of the twentieth century were citing the grim human costs of "welfare reform" for those willing to listen. First, the General Accounting Office of Congress reported that the wages earned by those who had left the welfare system for jobs were on average below the poverty level and, for many, well below that level. Reports also showed that more than 25 percent of those who got jobs soon lost them. Like the old system, but without its security, large numbers of people went on and off TANF hoping that their five years of eligibility would not run out. Many also found their health benefits far more haphazard than under AFDC Medicaid. One news story at the end of the Clinton years highlighted the case of a Brooklyn, New York, woman working at a job in order to keep her health benefits for herself and her

family. Fearing the loss of those benefits if she lost her job, she delayed seeking medical attention and died of a condition that may have been treatable had she sought medical assistance earlier.

"Welfare reform" did spark a revival of organizing among the poor at the end of the twentieth century. While the PRWORA cut off welfare benefits to legal immigrants, the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO), under the leadership of the reform-oriented John Sweeney, revived with limited success organizing drives among low-income workers. It also reversed labor's historic opposition to immigration by seeking to organize undocumented workers and actively defending both their rights and the rights of legal immigrants.

Labor also vigorously protested the attempt by many city administrations to replace municipal workers with "workfare" clients. New York, the nation's largest city, was the worst offender in this regard. After the passage of PRWORA, Mayor Rudolph Giuliani removed through attrition and other means 22,000 municipal workers and replaced those in unskilled positions in sanitation, city parks, hospitals, and welfare offices with workfare clients. At the same time, since PRWORA barred benefits for higher education, more than 20,000 recipients formerly under the AFDC system dropped out of the City University of New York. Critics noted that New York paid less than 15 percent of the wage of a full-time unionized municipal employee to workfare workers and no benefits.

Community-based welfare rights groups sprung up throughout the country to resist welfare reform, reviving many of the tactics of the Welfare Rights Organization of the 1960s. Perhaps the most significant was the Philadelphia-based Kensington Welfare Rights Union (KWRU), founded a few years before "welfare reform" by Cheri Honkala, a former "welfare mother" committed to building an alliance between welfare recipients and the labor movement. Using civil rights nonviolent civil disobedience tactics and the disruptions of NWRO groups, KWRU launched a Poor People's Economic Human Rights Campaign, affiliated itself with the American Federation of State, County, and Municipal Employees (AFSCME), which has a large female membership, and used sit-ins, tent cities of the poor, and other time-honored tactics and peaceful picketing of welfare offices to publicize their view that public assistance was a human rights issue.

Honkala became a national leader of the Labor Party, a new party founded by progressive trade unionists, which has made a constitutional amendment to establish the right to a job as a major issue. Honkala led a Freedom Bus across the country in 1998 to show increased urban and rural poverty. At the end of the national fact-finding tour, Honkala and KWRU leaders brought the findings, including the accounts of the poor themselves, to the United Nations (UN) to argue that U.S. policy toward the poor constituted a violation of the United Nations' 1948 Charter on Human Rights.

The election of 2000 produced little discussion of poverty or the rights of poor, except in Ralph Nader's Green Party campaign for president, which called for repeal of the Taft-Hartley law and highlighted the disastrous effects of public policy on the nation since the election of Ronald Reagan in 1980. Certainly, the low turnout and the active campaign to keep poor and minority people away from the polls by the Republicans in Florida contributed to George W. Bush's victory in the electoral college, even though he received more than 500,000 fewer votes than Democratic presidential contender Al Gore.

Although millions of potential Nader voters returned to the Democratic fold by election's end, Ralph Nader's nearly 3 million votes represented the most important challenge to establishment politics, raising questions of the rights of labor, minorities, and the environment since Henry Wallace's 1948 campaign. The combined Nader-Gore vote represented a solid victory over the combined Bush-Buchanan vote, however irrelevant that might be in the electoral college.

The crushing defeat of the 2000 Republican ticket in California, a state that pioneered in anti-welfare, anti-immigrant politics for much of the last four decades of the twentieth century, was seen by some as a harbinger of future politics. Latino voters in larger numbers than ever before voted against politicians whose stock in trade had been to scapegoat them as illegal immigrants and the undeserving poor. (In the state's ever-changing political climate, however, Republican Arnold Schwarzenegger was elected governor in the October 2003 recall vote without the majority support of Latinos.)

Although the turnout remained abysmally low, the decisive defeat of the Republican ticket in states like Illinois, Michigan, and New Jersey, and a much greater than usual defeat in New York, suggested that those states that, together, house a majority of those on public assistance, and a disproportionate number of low-income "working poor," had turned sharply

away from the anti–social welfare anti-taxation philosophy that Ronald Reagan made the center of U.S. domestic policy, George Bush faithfully continued, Bill Clinton softened, and George W. Bush has attempted to harden.

Both presidential and congressional majorities for conservative and Republican politics now depend on a new Solid South, along with agricultural, mountain, and Southwestern Taft-Hartley "right to work" states. A labor–poor people's political coalition could perhaps once more make social welfare, social justice, and social equality, into principles and policies at the center of American politics.

The damaging effects of September 11 on the ability to organize and mobilize against poverty are unquantifiable. Large increases in military spending will not likely trickle down to the poor. Moreover, efforts to increase the rights of immigrant workers through organizing low-wage workers from Latin America, China, and South Asia could be halted by the ongoing efforts to significantly expand internal security agencies and reduce the formal rights of noncitizens and those citizens who associate with them. Although the future of the poor people's movement remains uncertain, the poor continue to mobilize to improve their conditions on an everyday basis, which inevitably will lead to a new surge of organizing and militancy in the future.

Settlement House Movement

An offshoot of Christian Socialist theory and experiments in communitarian approaches to meeting the needs of the urban poor already in operation in Britain, the settlement house movement in the United States was a response to rapid urbanization and industrialization and the changing face of labor at the end of the nineteenth century. The movement thrived from the 1890s through the end of World War I. It provided a foundation for a spectrum of Progressive social reform causes and campaigns primarily designed to better the lives of immigrants, tenement dwellers, and sweatshop and factory workers who increasingly populated American cities.

Theory and Origins

With many exceptions, settlement house movement activists were primarily college-educated reformers of Anglo-American descent; among them were religious men and many able women. In tackling problems like dilapidated and crowded housing, exploitative work conditions, lack of sanitation, and inferior education, they sought to implement improvements through political means and the application of social-scientific methods. Many gained inspiration from the example of Samuel Barnett's Toynbee Hall (which had opened in 1884 in the East End of London) and approached their work with a secularized sense of missionary calling.

In theory, the leaders of the movement embraced the idea of the mutual good and enlivened democracy that could come from native-born middle-class reformers living and interacting among the ethnic immigrant poor. They were keenly interested in replacing older models of charity and philanthropy with models of direct interaction across cultures and classes—an arrangement thought to fulfill the potential of the privileged as much as benefit those they came to serve.

Among the first settlements founded in the United States (in 1889) were Jane Addams's Hull-House in Chicago and the New York College Settlement on the Lower East Side of Manhattan. The New York College Settlement was begun as the first experiment of the College Settlement Association, which had been organized by Vida Scudder and a small group of Smith College alumni and soon involved other graduates of eastern women's schools. By 1893, Lillian Wald's Henry Street Settlement was founded in New York, with a particular emphasis on public health and nursing.

In the next two decades, hundreds of settlement houses and neighborhood agencies were created across the country, but the movement was centered primarily in the cities of the Midwest and Northeast. The National Federation of Settlements (founded in 1911) helped coordinate the movement's direction and concerns.

Settlement Innovations and Services

Influenced by the teaching of John Ruskin, William Morris, and others, several settlements placed an emphasis on the uplifting power of aesthetics and opportunities for self-expression as well as practical matters of achieving greater social equity. The residents of Hull-House, in particular, established a wide range of cultural as well as social programs to help elevate the lives of the primarily Irish, Italian, Greek, Russian, Polish, and eastern European immigrants whom they served. They sponsored ethnic festivals, encouraged appreciation of traditional crafts such as embroidery and weaving, taught pottery making and book arts, and offered studio space to artisans trapped in the daily drudgery of factory production. Musical evenings were offered as neighborhood entertainment, and community theater productions were mounted. Meanwhile, settlement supporters worked for the incorporation of music and the arts into public school curricula.

JANE ADDAMS (1860–1935)

Jane Addams was a leader of the settlement house movement in the United States and a key public proponent of Progressive Era reform. As an intellectual and activist, she helped formulate the Progressive response to urbanization and industrial capitalism. Through her many writings and her work as a negotiator and as a founder and leader of organizations, she influenced public consciousness and created a groundswell of popular support for a multifaceted reform agenda. In the World War I era she became a leading organizer of the international peace movement.

Addams founded Hull-House in Chicago with Ellen Gates Starr in 1889 and directed the settlement until the end of her life. In addition to her local work in education, sanitation, and civic reform, she was a national leader within the suffrage and women's rights movements and an advocate for the labor movement and social justice causes. Among the hundreds of organizations in which she was an officer or had a founding role were the National Women's Trade Union League, the National Federation of Settlements, the National American Woman Suffrage Association, and the National Association for the Advancement of Colored People. She was a stalwart, along with her friends Florence Kelley, Julia Lathrop, and other allies, in lobbying campaigns for protective labor legislation, factory and consumer regulation, the living wage and the eight-hour day, children's rights, and juvenile justice.

Many of the programs Addams originally advanced as an activist were codified in the 1920s and 1930s through the professionalization of social work, the passage of state and federal reform legislation, increased gains for unionization and collective bargaining, and the creation of New Deal agencies. They were revisited in the antipoverty programs of the 1960s.

As a champion of cultural pluralism, nonpartisan mediation, and a maternalist brand of feminism, Addams was alternately criticized for being too moderate and too radical. She devoted the last portion of her life to the peace movement, arguing the connection between militarism, poverty, and political repression. Her opposition to intervention by violent means alienated her from many of her former activist colleagues who supported entry by the United States into World War I. Building on her ties in the American Union Against Militarism (later the American Civil Liberties Union) and international networks of suffrage supporters and women reformers, she helped convene and chaired the International Congress of Women at The Hague, which gathered together over 1,500 women from a dozen European countries and the United States in April 1915 in opposition to the war. She subsequently led the delegation from the congress to meet with the heads of warring nations to urge nonviolent resolution. Through this activism was born the International Committee of Women for Permanent Peace, which became the Women's International League for Peace and Freedom (WILPF) in 1919. Addams served as its president until her death in 1935. During the 1920s, WILPF strongly supported the principles of international alliance and economic aid manifested in the League of Nations. In explicit recognition of her role in creating an international women's peace movement, Addams was awarded the Nobel Prize for Peace in 1931.

Addams was much buoyed in her public career by her decades-long relationship with Hull-House patron and volunteer Mary Rozet Smith. She died of cancer in Chicago in 1935 in the midst of the Depression and was buried in her hometown of Cedarville, Illinois.

Addams's writings include *Democracy and Social Ethics* (1902); *Newer Ideals of Peace* (1907), *Twenty Years at Hull-House* (1910); *Women at the Hague* and *The Overthrow of the War System* (both with others, 1915); *Peace and Bread in Time of War* (1922); and *Why Wars Must Cease* (with others, 1935). Swarthmore College and the University of Illinois, Chicago, hold major collections of her papers, including settlement house and peace movement records. The *Jane Addams Papers* microfilm edition includes those materials as well as others from hundreds of repositories.

Barbara Bair

Encouraging literacy, debate, and literary appreciation were other aspects of settlement life. Settlement volunteers organized lending libraries, book clubs, and lecture series. They offered newly arrived immigrants and striking workers literacy courses and English-language training, and they helped facilitate lifelong learning and stimulate political discussion by sponsoring working people's debating societies.

Child welfare, early child development, and education were a special focus of the settlement house movement from its inception. Settlement teachers offered innovative approaches to kindergartens and day care. They opened gymnasiums, led physical education classes, and urged cities to establish playgrounds, parks, and open spaces. They sponsored boys and girls clubs, offered field trips to rural settings and mu-

seums, and ran afternoon and summer arts and recreation programs for children. Parenting skills and family health care were a closely related concern. Settlement workers organized mothers' clubs and taught cooking, sex education, and nutrition classes. Some settlements operated dispensaries (free or low-cost medical clinics) and pharmacies, or helped provide home health and midwifery services, as well as access to job training or work referral services.

Although a majority of settlement services were directed at immigrant neighborhoods, some settlements operated separate branches for black residents. In African-American neighborhoods, community-based social services were implemented through mutual aid societies and neighborhood associations and, later, through such organizations as the National Urban League (founded in New York in 1911), which provided services to migrating workers. The Phyllis Wheatley Settlement in Minneapolis and the White Rose Mission and Industrial Association (founded in New York in 1897 by Victoria Earle Matthews) were created to provide residences for young African-American women entering the city to work. The White Rose Home offered a distinguished lecture series, a kindergarten, and training classes in skills that would gain women jobs in domestic service, which then was the leading job sector for African-American working women. In Atlanta, Lugenia Burns Hope, the founder of the Atlanta Neighborhood Union, was one of the prominent activists in the settlement and municipal reform movements.

Municipal Reform and Labor Activism

Beyond the boundaries of their wards, settlement activists were instrumental in instigating civic reform as well as in supporting organized labor. They helped expose corruption in city politics, develop community gardens, provide sanitation to tenement alleys, improve public health, and monitor safety and work conditions in factories and sweatshops. Settlement houses were used as meeting places for arbitration and union meetings and as clearinghouses for information during strikes, most importantly during general strikes in the needle trades in New York and Chicago in 1909–1911. In coalition with the National Women's Trade Union League (WTUL), the International Ladies' Garment Workers' Union, and other labor organizations, settlement activists and their wealthy patrons (many of whom were also supporters of the suffrage movement) helped provide legal aid and food relief as well as a middle-class presence on the picket lines, in the jails, and in the courtrooms. Leading women labor organizers like Mary Elisabeth Dreier, Margaret Dreier Robins, Leonora O'Reilly, and Mary Kenney O'Sullivan all had close ties to the settlement movement, and many were also advocates of feminist causes.

Broader Reform

Settlement movement members were deeply involved outside their own cities as leaders in the wider social justice movements of their day. Beyond the labor and public health movements, they helped foster the suffrage and temperance movements, consumers' rights, and, increasingly in the World War I era, the international peace movement. Founding and working within reform organizations like the National Consumers League, the National Child Labor Committee, the Immigrants Protective League, the Juvenile Protective Association, and the WTUL, they helped mount anti-vice and anti-prostitution campaigns, supported protective labor legislation (including restrictions on work hours and child labor), and were primary advocates for juvenile justice, penal reform, and pure food and drug laws, as well as vocal critics of civic corruption—all functions that earned them the title of "civic housekeepers." Others, especially those who worked closely with the labor movement or who had emerged primarily out of the Anarchist and Socialist movements, were dedicated to a more militant and radicalized brand of social change.

Transitions, Limitations, and Decline

Although many settlements still exist in modern form as neighborhood centers and community-based anti-poverty agencies, the settlement movement as a whole began to decline markedly in the 1920s.

In many ways, the movement was phased out by its own success. Many of the kinds of social services and educational, investigatory, and regulatory functions first provided by settlement workers—or created through their political lobbying and support—were superseded by the routinizing of city services and the burgeoning of a social welfare state. Reforms once pioneered through the settlements were absorbed into the formal operations of governmental agencies (such as the U.S. Children's Bureau, created in 1912), incorporated into public school systems, or legalized through federal and state legislation (such as the Sheppard-Towner Act, passed in 1921). During Franklin D. Roosevelt's administration, many settlement

innovations were bureaucratized in the programs of the New Deal.

The social conservatism of many of the old-elite leadership of the settlement movement and an essential blindness to the negative economic consequences of many of their programs—from protective legislation to housing codes—sometimes proved a barrier between activists and the working poor they sought to benefit. Top-down policies that movement leaders advocated also sometimes crossed the line between social reform and social control. Established leaders failed to adequately delegate or yield internal positions of power to immigrant women within the hierarchies of settlement leadership, and their settlement microcosms did not reflect the very kind of ethnic diversity at top levels that they theoretically championed in society at large. The settlement movement failed to meet the needs of a changing city population; namely, to adequately extend its vision of democracy from ethnicity and cultural pluralism to race. Despite the presence of some settlements in African-American neighborhoods, and the overlap between the movement and such organizations as the National Association for the Advancement of Colored People, the national movement was effectively segregated, to the virtual exclusion of African-American concerns, and local agencies were often so poorly funded that they were short-lived.

Just as frustration with the prescribed roles and relations of women helped foster the power of the settlement movement, so did wider opportunities for middle-class and working women help signal its decline. The advent of coeducation, the ratification of the Nineteenth Amendment granting women the vote, the rise of social work as salaried labor, the opportunity for some positions of responsibility in city and federal bureaucracies and within union leadership, and a renewed social emphasis on marriage attracted potential residents to other options and made low-paid or volunteer work and collective living appear less desirable. As Judith Ann Trolander has pointed out, as social work was professionalized, settlement work also changed in nature, becoming increasingly clinical and masculinized. The original emphasis on children was lost, as was the milieu of communalism and alternative lifestyle. Neighbors instead became clients. Immigration restriction, racial violence and polarization, and the social consequences of World War I with its antipacifism and the breakdown of alliances between liberals and the American Left also took its toll. Private systems of funding broke down. And generations changed. The proper Victorian behavior and elitist ideas of aesthetic uplift manifested among many of the old-school settlement house leaders distanced them from young working girls for whom dance halls, theaters, and other sources of mass entertainment were among the joys of life. Working people and the poor began increasingly to speak for themselves. The movement's original leaders grew elderly, and the focus of advocacy changed for many of them from local and national to international concerns.

The Unemployed Organize

When the U.S. stock market crashed on "Black Thursday," October 29, 1929, few people would have predicted that the economy would remain stagnant for another twelve years or that a second world war would be responsible for reinvigorating U.S. industry and the economy. The years between Black Thursday and the Japanese attack on Pearl Harbor on December 7, 1941, marked the beginning and end of the period referred to as the Great Depression. Some of the most significant economic policies, including Social Security and unemployment insurance, were implemented during this decade under President Franklin D. Roosevelt's (1933–1945) New Deal initiatives. By the time the United States declared war on Japan and officially entered World War II, the government had assumed the role of caretaker of its citizenry to a degree unthinkable prior to the stock market crash. After having weathered the 1930s, the majority of U.S. citizens believed that the government should provide a safety net for its citizens so that great numbers of them would never again suffer long-term unemployment, homelessness, and starvation.

Sheer desperation forced most people to change their minds about governmental intervention. It took many years of debate, discussion, and protest, however, for the people to agree that Franklin Roosevelt's New Deal policies were necessary. Prior to the onset of the Depression, Presidents Calvin Coolidge (1923–1929) and Herbert Hoover (1929–1933) and the majority of the presidents before them subscribed to the theory of laissez-faire economics, albeit in different ways and to different degrees. Supply, they thought, would adjust to demand, and vice versa; the federal government should not directly intervene in the economy even in times of crisis. Even two years into the Depression, President Hoover advised people to do their best to weather the current period of instability. Eventually, the market would balance itself. In a statement representative of Hoover and his advisers' thinking, historian Franklin Folsom in *Impatient Armies of the Poor: The Story of Collective Action of the Unemployed, 1808–1942* (1991) writes that Charles W. Schwab, chairman of the board of Bethlehem Steel, advised people in 1931 to "Just grin, keep on working, stop worrying about the future and go ahead as best you can. We always have a way of living through hard times."

Private Charity and Government Relief

Government relief was, for Hoover, simply out of the question. Private charities, which had for generations provided food, shelter, and clothing for the needy in times of distress, should continue to carry the burden of providing relief. Even though private agencies were quickly overwhelmed, Hoover refused to commit federal resources to provide relief to the poor. He believed that doing so, even temporarily, would set a dangerous precedent. Citizens would quickly become dependent on the government dole and lose not only their motivation to work but also their competitive spirit. Competition and innovation were, for Hoover, the hallmarks of American industry. He refused to authorize government relief payments because he believed dependence on the dole would dampen that spirit and create a lethargic and hopeless citizenry. Eventually, even Hoover conceded that some amount of governmental intervention was unavoidable. He did not, however, authorize Congress to devote monies to feeding, clothing, or providing shelter for the growing numbers of homeless in the United States. Instead, and in line with his philosophy, Hoover created the Reconstruction Finance Corporation to prevent further bank closures. Voters thought he offered too little too late. Roosevelt won the election of 1932 by promising Americans a "New Deal" and by offering people hope that the government would indeed

On March 8, 1933, the Emergency Unemployed Relief Fund distributed $27,000 to 1,300 desperate men in New York. *(Brown Brothers)*

intervene and that their dire situations would improve as a result.

By the time Roosevelt took office in 1933, the United States had suffered through three years of economic depression. Although Roosevelt disliked the idea of increased government intervention, unlike Hoover, he believed desperate circumstances required desperate measures and he took action. As governor of New York, he had committed state funds to help relieve suffering, and he intended to continue to do so with federal funds as president. The U.S. government, according to Roosevelt, had an obligation to intervene. Furthermore, developments worldwide suggested to him and his advisers that government intervention might prevent radical political movements from gaining a foothold among the more desperate of the population. Extremists on the left and the right had supplanted ruling bodies in Russia, Germany, and Italy during the 1910s and 1920s. If the U.S. government wanted to prevent revolutionary movements or Fascist dictatorships from gaining a foothold, it needed to provide some reason for its people to remain loyal. Roosevelt's fears were not unfounded. In the months after the stock market crashed, Communists, Socialists, and other radical groups gained popularity, especially among the desperate unemployed whose numbers grew at an alarming rate between 1929 and 1933.

The economic collapse of the 1930s witnessed the largest percentage of unemployed, and the largest cor-

responding movement of the unemployed, in U.S. history. During 1933, the worst year of the Depression, the first year of Roosevelt's presidency, the unemployment rate reached just over 25 percent. Even those lucky enough to find a job often worked less than full time. Widespread unemployment and underemployment created what historian Irving Bernstein calls a society "adrift." People who grew up during the Depression remembered moving "all of the sudden" to follow leads on jobs, because they were evicted from their apartments, or because they lost their homes. Men left their wives and children for months at a time to find work. Many men and women traveled by freight train creating the popular image of the wandering "hobo." Eviction and foreclosure caused people to take any available shelter. One woman recalled that she and her family lived in a garage for seven years. Others were not as lucky. A number of squatter settlements derisively labeled "Hoovervilles" in honor of then president Herbert Hoover emerged as increasing numbers of people lost their jobs and were evicted. One survivor of the Depression described a Hooverville in Oklahoma City that measured ten miles square. People, she recalled, lived in rusted-out car bodies, made shacks out of orange crates, and lived in holes in the ground. Others remembered constant hunger and the threat of starvation; hospitals routinely treated people who fainted from hunger. In order to escape the bitter cold of the winter months, still others migrated to southern states to avoid the freezing temperatures.

Unemployed Activism

People coped with the Depression in a number of ways. While many moved around in search of employment, others became apathetic. Most relied on family members, neighborhood associations, and churches to help make ends meet and turned to private charities only after they had exhausted all of their resources. People were ashamed to ask charities for money or food. Only the "pariahs" of society, namely, paupers, beggars, drunkards, and prostitutes, depended on relief. Turning to the almshouse or workhouse, the most common public relief agencies in existence in the early years of the Depression, was viewed as a last resort, and yet, as the Depression worsened, even these institutions-of-last-resort were overwhelmed with requests. As people realized that the economic slump was not short-term or temporary, as President Hoover predicted, feelings of desperation and hopelessness took over. Irving Bernstein includes in *A Caring Society: The New Deal, the Worker, and the Great Depression: A History of the American Worker, 1933–1941* (1985) the observations of two people who witnessed that hopelessness take over in New York and Chicago. Herman Shumlin, a Broadway producer, described the despair engraved on the faces of the men he saw waiting in breadlines: "I'd see that flat, opaque, expressionless look that spelled . . . human disaster." Similarly, Lewis Andreas, a medical doctor, described a march of the unemployed down Chicago's Michigan Avenue:

> A very scraggly march of the unemployed. Just a mass of people flowing down that street. In their minds, I think, a point was reached: We're not gonna take it anymore. I remember it particularly because of the silence. No waving of banners, no enthusiasm. An undercurrent of desperation.

Organizing and participating in a parade, march, or other demonstration designed to draw attention to your own condition of destitution was not easy. Yet desperation drove people to take action. Sociologists Frances Fox Piven and Richard Cloward find that some of the earliest expressions of discontent among the unemployed consisted of mob looting. People began to simply demand food. For example, 300 people in Henryetta, Oklahoma, demanded that a local storekeeper give them food and insisted that they were not begging. In New York City, 1,100 men broke out of the bread line they waited in to mob delivery trucks scheduled to deliver baked goods to a hotel nearby. According to Piven and Cloward, the organized looting of food became a nationwide phenomenon.

In addition to mob looting, people began in the early months of 1930 to demand that local governmental offices provide relief. In the years following the stock market crash of 1929, a number of groups emerged to organize protests against rising unemployment, to demand that the government respond more aggressively to the Depression, and to simply find ways to help the poor survive. Historian Roy Rosenzweig estimates that over 2 million people engaged in some form of protest in the 1930s. Radical political organizations were at the forefront of the early unemployment movements in the United States. Communists, Socialists, and the lesser-known Musteites—followers of labor leader Abraham J. Muste—for example, organized demonstrations and parades and formed unemployment councils and workers' committees to combat unemployment. They also helped people obtain relief, avoid eviction, and find work, without the stigma more often associated with

asking charitable associations for assistance. Communists, Socialists, and other radical groups were so popular during the early years of the Depression that Rosenzweig argues in a 1975 article, "Radicals and the Jobless," that, in 1933, "radical revolution seemed as likely as liberal reform."

Although only about 5 percent of the unemployed participated in organized movements, those who did challenged both the societal assumptions regarding the causes of joblessness and poverty and the capitalist system itself. Given the assumptions that had to be overcome, it is perhaps not surprising that the first organized efforts to challenge the condition of unemployment were waged by the Communist Party. The Communists organized the unemployed in the United States and other countries throughout the 1920s, focusing on the jobless in what historian Daniel Leab, in a 1967 article, "United We Eat," calls "chronically depressed" areas. In the months after the stock market crash, the Party gained popularity and expanded its efforts. Using the slogan "Fight Don't Starve," Communists began to organize unemployment councils in industrial centers throughout the United States. Communist Party organizers found recruits for the unemployment councils on bread lines, outside factory gates, in "flophouses," and outside relief offices. Housewives participated in Communist-inspired demonstrations in which they carried empty pots and pans.

One of the Communist Party's more successful organizing efforts of the early 1930s was the International Unemployment Day it held on March 6, 1930. Earlier that year, people had staged successful demonstrations in Chicago, Philadelphia, and Cleveland. The Communist Party decided to organize a demonstration to protest growing unemployment worldwide. Piven and Cloward report in *Poor People's Movements: Why They Succeed, How They Fail* (1977) that rallies and marches were held more or less simultaneously in most major cities in the United States. One of the larger and more volatile demonstrations of the day occurred in New York City, where over 35,000 people gathered in Union Square to protest widespread unemployment. Organizers had promised the police that the demonstrators would remain in Union Square. When thousands of people began to march toward City Hall, New York City, police rushed into the crowd with clubs. People described the ensuing confrontation as a "scene of battle." Despite or perhaps because of the violence, Mayor Jimmy Walker formed a committee soon thereafter to collect and distribute funds to the unemployed.

The New York City demonstration exhibited another characteristic unique to Communist organizing efforts of this period. Not only were Communists among the first groups to make demands on behalf of the unemployed, but they also paid particular attention to the unique circumstances African Americans found themselves in during the Depression. Few organizations in the United States in this period acknowledged the fact that, as bad as the Depression was for the men who had been accustomed to a steady income, it was much worse for African-American men and women who suffered from high levels of unemployment and underemployment during times of prosperity. In preparation for International Unemployment Day, Communists organized the Upper Harlem Council of the Unemployed and purposefully recruited African-American unemployed workers to participate in the protest. Historian Mark Naison, in *Communists in Harlem during the Depression* (1983), finds that Communists, by using slogans like "Negro-White Unity," made "blacks feel welcome in New York's first protest against Depression conditions."

Growing Poverty and Rising Resistance

The period 1931–1932 witnessed several similar marches in different locations throughout the United States as people began to demand that the government do something about the widespread distress caused by growing unemployment. Some of the marches were spontaneous, others locally organized, and still others a result of the efforts of the Communist Party. In March of 1932, Communists spearheaded a march of unemployed auto workers in Detroit known as the Ford Hunger March. The auto industry suffered enormously after the stock market crashed. Prior to the crash, auto factories produced over 5 million cars. By 1932, they were producing only 1.5 million. As a result, people in Detroit experienced the devastating effects of widespread unemployment earlier than people in most other cities. They had exhausted all of their resources and faced mass evictions and foreclosures on their homes by 1931. In November 1931, unemployed auto workers staged a hunger march on the Briggs plant in Detroit. The Communist-sponsored Unemployment Council in Detroit proposed that a similar and larger march take place at Ford. Unemployed workers numbering 3,000 gathered a short distance from the Ford employment office, located in nearby Dearborn, on March 7, 1932. As

they marched toward the office, they carried signs that read "Give Us Work" and "Tax the Rich and Feed the Poor." Dearborn police arrived on the scene, along with some guards from Ford's private security force, to disperse the crowd. They fired tear gas into the crowd and threatened to shoot. The unemployed responded by throwing stones at the police. More police were called in, and eventually shooting broke out. Five people died and several were wounded before the hostilities ended. The ensuing funerals gained national press coverage. The *New York Times* reported that more than 30,000 people attended the funerals.

Just months later, some of the Ford marchers joined veterans of World War I in perhaps one of the most well known unemployment demonstrations of the early 1930s. Again organized largely by Communists, "Bonus Marchers" marched at the Capitol building from as far away as Portland, Oregon, to demand that the government pay them their war bonuses early. Thousands of unemployed, mostly men, some with their wives and children, made their way to Washington on foot, by train, or by any means possible. Most, one observer recalled, were middle-aged and middle-class men, all now unemployed. They wore overalls or their old military uniforms. Franklin Folsom, in *Impatient Armies of the Poor*, describes a contingent traveling by freight car from Minnesota. The contingent posted a sign outside the car that read, "Pennsylvania Railroad #36865—Destination Washington, contents livestock, 55 veterans."

Once they arrived in Washington, it was clear that many of the veterans intended to stay. Even though some accepted President Hoover's offer to pay their way home, most of the veterans chose to stay in Washington. Some lived in abandoned buildings throughout the city, but most gathered in an area southeast of the Capitol called Anacostia Flats and set up a "Hooverville" within view of the Capitol building. Estimates of how many people lived in Anacostia Flats varied widely from as low as 11,000 to upward of 22,000. Nevertheless, it is clear that thousands of people gathered at the Capitol on June 17, the day before Congress was to adjourn, to demand their bonuses. President Hoover not only refused to meet the veterans' demands, but he sent the U.S. Army to disperse them from the Capitol and to level the settlements at Anacostia Flats. General Douglas MacArthur commanded the troops who threw tear gas into the crowd and set fire to their belongings. The public was outraged. Some blamed the Communists for inciting a riot. Others blamed Hoover for not responding to the needs of the unemployed. According to Piven and Cloward, a reporter for the *Washington News* voiced his disgust over the situation, writing "What a pitiable spectacle is that of the great American Government, mightiest of the world, chasing men, women, and children with Army tanks. . . . If the army must be called out to make war on unarmed citizens, this is no longer America."

Communists also began in 1930 to organize resistance to evictions. Small bands of people would use strong-arm tactics to prevent city officials from putting people's furniture out on the street. The Communists' Unemployed Councils were particularly active in combating evictions in Chicago where members would meet each morning and wait to hear who in the neighborhood had been evicted. Once they got word, they would go, as a group, to the evicted person's apartment and simply carry furniture back into the residence. City officials, marshals, and police found it difficult to counter the actions of the Unemployed Councils because, at least at that moment, the person who had removed the furniture was outnumbered. Members of the Chicago Unemployed Councils were often arrested and occasionally beaten for their actions. Eventually, however, the mayor of Chicago ordered a moratorium on evictions, and some of the unemployed eventually found work on the city's relief rolls.

In effect, the Communists launched a multipronged attack against unemployment. In addition to demonstrations and anti-eviction action, they also turned people's utilities back on and helped them apply for the limited relief that was available. The Unemployed Council's "gas squads" and "electric squads" went to people's houses after their utilities were turned off because of nonpayment and simply turned them back on. The "electric squads" simply rerouted wires around electric meters to reestablish the connection. Communists also helped people apply for relief. A woman in New York City recalled standing in line for three days "in the rain" outside the Home Relief Bureau with no success. After the Unemployed Council intervened on her behalf, she received a rent check one week later. Communists were particularly successful in obtaining relief payments for people because relief workers were not accustomed to dealing with aggressive, organized tactics. Most of the people who applied for relief were ashamed, meek, and generally not very demanding because of the stigma associated with being "on the dole."

Other politically motivated groups organized demonstrations and helped the unemployed make ends meet. The Socialist Party, for example, organized

Unemployed Leagues and Workers Committees. Unlike the Communists' Unemployed Councils, the Socialists' Leagues and Workers Committees drew upon the already existing network of settlement houses, ethnic neighborhood associations, and churches to organize their efforts. Socialists were particularly successful in Chicago, where, by 1931, they operated eight locals on Chicago's northwest side alone. By 1932, there were sixty Workers Committees operating in the city representing over 35,000 members. Like the Communist groups, the Socialist-sponsored groups helped people obtain relief and also attended to other immediate needs. They helped families in Chicago obtain coal for their furnaces and gain admittance to local hospitals when they needed medical attention. Also in 1932, the Socialists organized 35,000 people to protest a pending decision by Chicago authorities to cut the amount of relief the city distributed. Not only did Socialists help people successfully navigate the local relief system, but the Chicago Board of Public Relief agreed to have its local supervisors meet with members from the Socialist Workers Committees to discuss the needs of the unemployed in their respective areas.

Unlike Communist organizations, which lost some momentum by 1934, Socialists gained momentum throughout the early 1930s. Historian Roy Rosenzweig argues in a 1979 article, "Socialism in Our Time," that, by 1935, Socialists had organized "a locally based unemployment movement of significant dimensions" in New York, Pennsylvania, Indiana, New Jersey, Maryland, and Oregon. Rosenzweig finds that at that point Socialists claimed as many as 450,000 "adherents." In addition to continuing to obtain immediate relief for the unemployed, Rosenzweig argues that the Socialist Party's efforts "raised the political and social consciousness of its members by altering their views about public relief, by introducing them to principles of trade union organizing, by fostering interracial cooperation, and by reinforcing weakened bonds of community solidarity."

Finally, another movement-oriented group that deserves mention is the "Musteites." The Musteites, like the Communists and the Socialists, were a left-oriented group that followed the philosophy of Abraham J. Muste, a prominent labor leader. In the early 1930s, Musteites worked more closely with Socialists and trade unionists than with Communists. In fact, in some locations, the Musteites organized unemployment leagues in direct opposition to the Communist-sponsored Unemployed Councils. One of the more significant of the Musteites' contributions to the fight to combat widespread unemployment came in 1929 when they organized the Conference for Progressive Labor Action (CPLA). The CPLA launched a successful educational campaign the next year to promote unemployment insurance. It also joined with the Unemployed Citizens' League in Seattle, a movement of several thousand jobless, both to protest growing levels of unemployment and, like the Communists and the Socialists, to obtain food and supplies and help people apply for relief. In 1932, the CPLA and the Seattle-based Unemployed Citizens' League obtained 120,000 pounds of fish, 10,000 cords of firewood, and eight carloads of potatoes, pears, and apples from local merchants. Merchants either donated the food or had the unemployed work for them in exchange.

The Musteites, like the Socialists, organized unemployment leagues in various locations. Despite early success in Seattle, they sustained the most support in Ohio and Pennsylvania. In August of 1933, the Musteite-sponsored unemployed leagues in Ohio marched on the state capitol building in Columbus to demand more state aid. Musteites reached the height of their success in the spring of 1933, just as President Roosevelt took office. At that point, in Ohio alone, the Musteites had organized 187 unemployed leagues with over 100,000 members. In Pennsylvania, they had organized over 40,000 members into unemployed leagues. The Musteites, even more than the Socialists and Communists, found it difficult to gain a national following. They attempted to hold a national convention in Ohio in 1933, but fights broke out when the Musteites refused to recite the Pledge of Allegiance. A group took the podium in response and called the Musteites "reds." The group advised the attendees to come back the next day and pledge their support to both America and to "a militant fight for the jobless." One Musteite organizer recalled that even people who did not mind being called "reds" were reluctant to join the organization because being labeled a "red" or a "radical" made it even more difficult for them to find jobs. By 1934, the Musteites had lost a great deal of support. They had trouble raising enough money to buy gas for their cars and the postage necessary to distribute information about unemployment, much less to sustain a movement.

Conclusion

As Roosevelt's New Deal initiatives took hold during his first term in office, the Socialists gradually began to operate as a "national lobby for higher relief appropriations." Ironically, the Socialists' and Communists' success in influencing Roosevelt and his New

Deal policies proved responsible for both organizations' diminished popularity as the 1930s wore on. Many people began to look not to these radical political organizations but to Roosevelt and to the U.S. government to solve their problems. To Hoover's horror, Roosevelt delivered. Within two months of taking office, the new president set up the Federal Emergency Relief Administration (FERA) to dispense relief directly. He also put people to work by creating the Civilian Conservation Corps and the Works Progress Administration. Unlike Hoover, Roosevelt did not shy away from government intervention. His New Deal programs combined direct relief payments with government-sponsored employment and were intended to feed people, put them to work, and get the economy moving.

Although New Deal initiatives did alleviate some suffering and put many people to work, they failed in significant ways. Those people who suffered the worst from the Depression, namely, sharecroppers and tenant farmers in the South, were excluded from New Deal initiatives. Furthermore, New Deal policies failed to fully reinvigorate the economy, and the unemployment rate remained high throughout the 1930s. Nevertheless, once Roosevelt began to thoroughly commit the government to providing relief for its citizens, there was less need for Socialist- and Communist-inspired lobbying efforts, protests, electric squads, eviction parties, and others of their more successful programs. People began to believe in their government again. Roy Rosenzweig, in "Socialism in Our Time," describes the loyalty exhibited by jobless miners who "displayed the Blue Eagle, symbol of FDR's recovery program, on the entrance to the abandoned coke ovens they used as homes." Despite a loss in popularity and despite the fact that their efforts did not, as the Communists hoped, spur a worldwide revolution against capitalism, Socialists, Communists, and Musteites were very influential in publicizing the plight of the unemployed and in demanding that the U.S. government take action on their behalf. Coming together under the umbrella of the Socialist-organized Workers Alliance of America, the three groups became, according to Roy Rosenzweig, "FDR's left force." They maintained an agreement with Harry Hopkins, who administered the FERA, "to always ask for more" than they knew Roosevelt would give.

Whether Communist, Socialist, or Musteite, their efforts were both needed and appreciated. Each of these groups gained members simply by providing the help other agencies, whether private, local, charity, or religious, did not provide or were too overwhelmed to provide. Historians and contemporaries alike argue that the greatest contribution of these radical movements of the early 1930s was that they were the only organizations to step to the forefront to help alleviate the suffering of the poor. Rosenszweig relates Albert J. Muste's assessment of the situation at the time: "When you looked out on the scene of misery and desperation during the depression, you saw it was the radicals, the left-wingers . . . who were DOING SOMETHING about the situation, who were banding together for action, who were putting up a fight." Once Roosevelt took office and initiated New Deal programs that were designed with similar intentions, the Communists, Socialists, and Musteites lost a great deal of support. In the end, people preferred a reformed capitalist system to the revolution that radicals advocated.

Tent City Movements

At the turn of the millennium, the phrase "tent city movements" has increasingly come to denote intentional communities organized by the homeless. These communities serve both as an alternative to sleeping on the streets or in regimented shelters, and as a form of political protest against the material conditions and social policies that create and perpetuate homelessness.

Historical Background

The numbers of homeless or precariously housed Americans grew in the nineteenth and twentieth centuries along with industrial capitalism, urbanization, fluctuating labor markets, and an inadequate housing supply. Workers moved to areas that promised jobs, where the tight housing supply was marginally supplemented by working-class families taking in boarders and slumlords expanding spaces within already densely packed tenements. Skid rows became centers for the urban indigent, featuring cheap hotels and restaurants, single room occupancies (SROs), missions, and hiring halls. Men, women, and children without shelter huddled near heated grates on city streets, depended on passing boxcars for transportation and bedding, or joined fellow homeless in ramshackle shantytowns erected near cities' edges. Local governments alternated between tolerating transients during periods of labor demand and enforcing vagrancy and other laws to rid their communities of the homeless.

In the early decades of the twentieth century, transient male laborers often erected "jungles" or tent camps near dumps, railroad crossings, and rivers, far from officials' eyes. These encampments ultimately became important venues for the organizing efforts of the era's most legendary labor union, the Industrial Workers of the World (IWW), who with Western harvest and timber workers shared leads on work and agitated for workplace justice and the end to the domination of capital.

Workers evicted from company or landowner housing for strike and organizing activity often created tent cities for emergency shelter and to maintain community solidarity in their collective protests. Evicted from their homes during the 1913–1914 strike against Colorado Fuel and Iron, owned by Rockefeller's Standard Oil Corporation, coal miners and their families created the Ludlow tent colony to protest labor conditions. On April 20, 1914, National Guard troops fired into tents and burned the colony to the ground, killing two women and eleven children. The incident, known as the Ludlow Massacre, prompted demonstrations across the country against Standard Oil.

During the Depression, the numbers of homeless, hoboes, and encampments ballooned. While the self-governing "Hoovervilles" of the 1930s were rarely the site of radical organizing on behalf of the poor, their name and visibility came to signify the president's indifference and the federal government's failure to address the problems of joblessness and poverty.

The "Bonus Army" of 1932 created the most famous tent city of the period, erected for explicitly political goals, as 25,000 unemployed men camped at the edge of the nation's capital, demanding early payment of their military service bonus. The Hoover administration sent the army to disband and destroy the protest. Troops burned the Bonus Army homes and the transients' hopes that the federal government would assist them.

Other protests emerged out of the ranks of the unemployed in the 1930s, resisting evictions and refuting the notion that the jobless were responsible for their condition. Demands for federal assistance led the New Deal to aid homeless and unemployed workers through the Federal Transient Bureau and the Farm Security Administration, which created rural work camps. Still, most cities in the 1930s tried to send transients on their way and toughened vagrancy laws.

In the 1930s, when Southern sharecroppers and tenant farmers, like supporters of the Southern Tenant Farmers Union, were thrown off the land for organizing, they sought solidarity in makeshift tent camps. Even as late as 1960 in Fayette County, Tennessee, white property owners evicted more than 400 African-American tenant families for participating in the Fayette County Civic and Welfare League, which had initiated a voter-registration drive. With support of an African-American property owner, the families formed a community known as "Tent City." A smaller tent city arose in nearby Haywood County, where dozens of families had also been evicted for their political work. The Justice Department filed suit against landowners and merchants in Fayette County who had violated the civil rights of the tenants, and in July 1962 they were enjoined from interfering with the rights of citizens to vote.

Modern Tent City Movements

Post–World War II efforts to renew downtown areas, in decline because of suburbanization, often targeted skid row areas, traditional haunts of low-income people and transients. "Planning" and "renewal"—or gentrification—of urban cores translated into intensified struggles for poor people in need of housing. The demolition or conversion of SROs, which accelerated in the 1970s and 1980s, deindustrialization, deinstitutionalization, and defederalism combined to swell the ranks of the homeless, which included unprecedented numbers of women, children, and families. At the same time, officials, often pressured by merchants and new upper-income city residents, increasingly cracked down on the presence of the homeless and supported anti-homeless legislation.

This struggle over urban spaces catalyzed new forms of activism to challenge existing inequities and champion new housing policies. In the immediate aftermath of the assassination of Martin Luther King Jr. in April of 1968, the Southern Christian Leadership Conference spearheaded the "Poor People's Campaign" that culminated in the creation of an encampment on the Washington Mall. The central goal of "Resurrection City," which housed approximately 2,500 protesters, was to pressure the Johnson administration to fulfill the promises of the much vaunted War on Poverty. On June 24, police and National Guardsmen forcibly disbanded the protesters' community, arresting hundreds.

The 1970s marked the emergence of several important groups that built on the momentum of the Poor People's Campaign. Unions for the homeless sprung up in Philadelphia, Chicago, Baltimore, Boston, and Los Angeles, demanding living wages and affordable housing. Activist Mitch Snyder and Washington, D.C.'s Community for Creative Non-Violence, brought national attention to the struggles of the homeless, leading pray-ins, eat-ins, and the occupation of buildings. Similar groups such as Seattle's Operation Homestead, formed in many cities; while for the most part focusing on local issues and strategies, activist groups occasionally joined forces to influence national policy. The National Coalition for the Homeless, founded in 1984, organized 250,000 to appear in Washington, D.C., in October 1989 with its Housing Now! March. These actions combined with litigation by advocates pressured Congress to hold hearings and support a patchwork of new programs in the 1980s, but the government provided little funding for new housing.

Building on historical efforts by the homeless to assert autonomy through independent communities, the modern tent city movement has taken a stand to highlight the lack of affordable housing and to reclaim public spaces that have increasingly excluded the poor. Since the 1980s, tent cities have materialized in cities as diverse as Las Vegas, San Diego, San Jose, and Corpus Christi. Tent city activists have built on elements of the civil rights, women's, gay liberation, environmental, and poor people's movements to draw attention to their marginalization and inability to obtain minimal shelter, and to create solidarity in a self-governing community. Some tent cities were designed as short-term political protests. Homeless activists, for example, erected tent cities in front of the Illinois, California, and Washington state capitols to lobby for funding. Others have sought to create more permanent communities to provide an alternative model of shelter that fosters self-governance, empowerment, and autonomy.

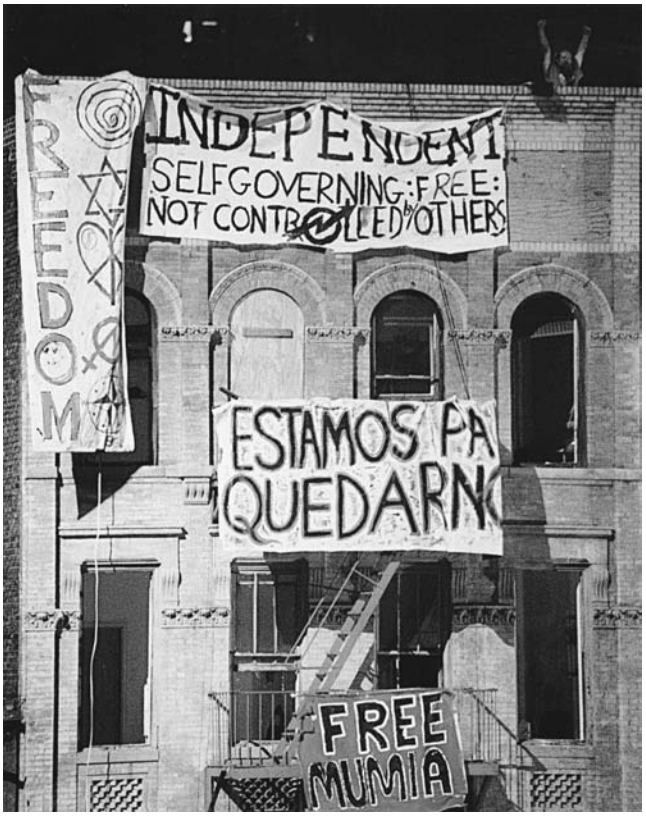
The pioneers of the contemporary tent city movements are vocal critics of the shelter system, and more broadly of charity-based approaches to poverty; furthermore, they frequently examine the systemic roots of homelessness, critiquing capitalism and the high unemployment rates that sustain it. Residents of tent cities argue that their itinerant housing provides a preferable alternative to overcrowded and unsanitary shelters and more effective security for their few remaining material possessions. Tents and lean-tos, however ramshackle, tend to provide greater privacy than is afforded in most shelters. Tent communities, moreover, embrace both gay and straight couples, and in some cases, children, while shelters almost univer-

sally enforce gender segregation while excluding same-sex couples. In addition, while nationally only a handful of shelters allow pets, they are a visible feature of tent city landscapes. While the majority of shelters are open to residents only at night, tent cities accommodate the variable hours of the working poor.

At the same time, residents emphasize that the collective nature of tent city living protects them from assault. They note that, while crimes perpetrated by "transients" receive amplified media attention, crimes against the homeless go largely unreported in local and national media and are frequently acknowledged only in the pages of the country's approximately thirty newspapers published by and for the homeless. Notably, within days of the forced closure of the Las Vegas tent city in July 2001, a former resident of the encampment was severely beaten and robbed by three assailants, and another homeless man was beaten to death.

Homeless activists erected tent cities with pointed political goals to move individuals out of the relative isolation of urban doorways to become a more visible presence to city officials and residents. Many of these efforts have negotiated small victories, including city promises to expand shelter beds and housing units. In 1993, the city of Eugene sanctioned a three-year experiment to allow the homeless to camp on a parking lot near the University of Oregon's Autzen Stadium. When funding ran out, the Centennial Car Camp closed, but the city was forced to continue to allow some scattered legal camping on unused public parking lots. Squatters who created Camp Paradise in Santa Cruz refused to budge for a year until in early December 2001 a rainstorm flooded away the tent city. Although police had ticketed the campers, the city did not aggressively pressure the camp to disband and after the flood provided motel vouchers until the campers could find a new site. The camp's success in garnering much local support inspired city council members to reform Santa Cruz's homeless services, including allowing a homeless campground.

More often, the tent city movement has met resistance from neighbors, police, and elected officials. In 1991, officials disassembled a Santa Ana, California, camp after allowing it to exist for a year, and in 1992, Marin County, California, officials shut down a camp that sprang up after the city closed a National Guard Armory shelter. As the homeless have been driven out of some spaces and ingeniously occupy other public sites, city officials enact new rules or conduct sweeps. When over a hundred people living in Tompkins Square Park on Manhattan's Lower East Side protested the city's efforts to remove them, the city closed and fenced off the park for "renovations." The police in Washington, D.C., tore down temporary shacks erected each day in Lafayette Park. San Francisco, which by the early twenty-first century had gained the reputation as the most hostile city in America toward the homeless, alternated its methods of removing the homeless just as quickly as the homeless found new places to camp. In December 2001 officials fenced off the area that had housed a tent city under Highway 101.



Squatters—people who take over abandoned land or property—seized this building in New York City before being evicted by police in 1995. *(AP Wide World Photos)*

It is not simply the transitory nature of the accommodations that garners resistance from local communities and authorities. In fact, officially sanctioned tent cities have long been embraced as an answer to housing and prison shortages, to attract low-wage laborers, and to house state troops called to quell civil dissent. In Alaskan fishing towns like St. Petersburg, city-sanctioned tent cities have long served to accommodate seasonal workers. In California, in the absence of both affordable conventional housing and sustain-

able wages, 1,100 state-sanctioned and licensed tent cities serve a fraction of the state's estimated 700,000 migrant farm workers on a seasonal basis. In the late 1990s, as an answer to overcrowded jails, Phoenix, Arizona, launched a pilot tent city jail, housing as many as 1,580 inmates. What distinguishes the embattled tent cities of otherwise homeless individuals from these provisional accommodations is the extent to which they visibly signify their collective rejection of officially sanctioned strategies for managing the poor and as a critique of the social and economic conditions that create and perpetuate homelessness.

West Coast Efforts

Although cities grew determined to eliminate encampments of more than a few people, a number of coalitions persisted on the West Coast to sustain the new tent city movement. Three tent cities have been the most visible and have served as models for other embryonic efforts.

In January 1985, activist Ted Hayes and seventy-three homeless men, women, and children established a shantytown in Central City East, or Skid Row, in Los Angeles. From its inception, "Justiceville" had strained relations with city authorities and social service providers alike. Despite efforts by advocates and a thirty-five-day fast by Hayes, the city closed Justiceville/Homeless, USA, on May 10. For the next eight years LA's homeless, including former members of Justiceville, lobbied government and businesses and engaged in civil disobedience to demand attention to the plight of the homeless. In November 1993 the Dome Village, originally known as Genesis One, opened as an innovative effort to provide a structural alternative for those unable or unwilling to live in traditional shelters. The twenty Omni-Sphere domes softened the harsh downtown skyscraper landscape and provided community and living spaces for many shunned by traditional service providers. The self-governing project sought to empower and engage residents in productive activities to help transition them out of homelessness. The village spawned a number of micro-enterprises, created a CyberDome computer learning center, and cultivated an organic garden.

During the Goodwill Games held in Seattle in the summer of 1990, a group of homeless men and women decided to camp out on the waterfront in clear view of tourists and the city's major daily newspaper. To underscore the need for affordable housing, on Thanksgiving activists created a tent city beside the Kingdome, which prompted city officials to provide more indoor shelter space. Campers organized as the Seattle Housing and Resource Effort (SHARE) and formed alliances with churches and other community groups, including the homeless group Operation Homestead, to address the need for low-income housing. SHARE organized shelters, laundry and storage facilities, and new housing units. In 1993, a group of women within SHARE formed Women's Housing Equality and Enhancement League (WHEEL) to advocate for homeless women's concerns.

As in other cities, Seattle's homeless made some headway while seeing other gains erode. Activists periodically camped out in front of municipal buildings to demand lodging lost by redevelopment efforts in the 1990s. As a new mayor in 1998 held a housing summit to address the needs of the homeless, his police force began its regular bulldozing of campsites above I-5. In response, SHARE/WHEEL reconstituted Tent City on Beacon Hill in June. Even as police closed the site, Mayor Paul Schell promised new funds to eliminate homelessness. SHARE set up two more tent communities in 1999 to provide shelter during the WTO protests; this time activists, banding together with advocates from local faith communities, strategically located their encampment on church properties to strategically resist the city government's attempts to raze the settlement.

When winter response shelters closed in March 2000, the group again raised a tent city, which persisted through thirteen forced moves by the city on threats of zoning violations against private landowner hosts. In August, El Centro de la Raza invited the tent city and its 100 residents to locate at its center for the next six months. Because the city rejected El Centro's application for a tent-city permit, residents moved to a church and battled the city in court. In September 2001, a King County superior court judge ruled that because the military, Scouts, and disaster-relief groups had histories of establishing safe encampments, the city could not discriminate against the homeless group's permit efforts. A new federal law that appeared to allow churches to ignore land-use codes while engaged in religious practices also strengthened Tent City's cause. In March 2002, Seattle and Tent City representatives signed an agreement that allows the community to remain in one commercial or residential spot for up to three months.

Influenced by the Los Angeles and Seattle movements, Portland's latest tent city movement was initially catalyzed by a Multnomah County circuit court decision in September 2000. Striking down the city's ban on outdoor camping, which dated back to 1981, Judge Stephen L. Gallagher ruled that the ordinance

Staking tents beneath an overpass, homeless people built the community of Dignity Village in Portland, Oregon, in 2001. *(Photo by Bryan Pollard)*

constituted "cruel and unusual punishment," and effectively punished "the status of being homeless" and impeded homeless people's right to travel. With the city intent on appealing the decision, on December 16, 2000, with support from *street roots*, a nonprofit newspaper largely staffed and distributed by homeless people and covering issues of concern to the homeless, a core group of eight homeless individuals pitched their tents on public land under the Morrison Bridge in downtown Portland. Despite Gallagher's decision, the threat of arrest impelled five early moves even as the "camp's" population steadily grew, until a formal agreement was struck with the city authorizing the camp's temporary location under a freeway.

The relative stability of new, albeit temporary, legitimacy enabled the birth of Dignity Village, as residents created community coalitions and partnerships, held press conferences, teach-ins, and public meetings, and developed a website to foster more effective outreach to the immediate community, as well as to other national and international tent cities. Villagers worked in concert with University of Oregon architectural students and with the City Repair Project to develop architectural plans for a permanent settlement at a fraction of the cost of conventional low-income housing. The plans included communal gardens, a "piazza" for gatherings, wind power generators, composting toilets, and a gray water irrigation system as an expression of the village's ecological consciousness and commitment to sustainability.

Forced in September 2001 to relocate to a fenced enclosure abutting the city's leaf composting yard outside the city center, with the help of City Repair, Portland's Rebuilding Center, Americorp volunteers, and other supporters in the community, the village erected a communal hall and domed conference room out of salvaged materials. In the spring, villagers banded together with Portland's Environmental Middle School, greenscaping the blacktop with communal

vegetable beds and container gardens scattered throughout.

The village has variously participated in arts and theater projects, has entertained a barrage of local and international reporters interested in its experiment in community, has fashioned a partnership with a Japanese tent city, and is the site of a literacy project in partnership with Washington State University Vancouver. In February 2004, Portland city officials granted the village campground status, making it legal for the sixty residents to remain in their self-regulated tent community.

Homeless advocates debate whether tent cities can ultimately affect larger social change needed to address the lack of affordable housing in the United States. Others worry that the attention and resources devoted to the camps will detract from other efforts to develop adequate and humane emergency and long-term low-income housing. The latter argument, which tends to focus almost exclusively on the quality of housing, generally fails to adequately acknowledge the challenge that tent cities, with their emphasis on self-determination, pose to the country's core political assumptions. It must be noted, however, that many homeless themselves prefer shelter beds or more independent living on the streets to tent city accommodations. But tent city activists believe that they are creating community and "homes," while engaged in a political project to draw attention to homelessness.

Student Movements

Introduction

Student movements in the United States are largely a phenomenon of the last three quarters of the twentieth century. Student protests in the eighteenth and nineteenth centuries focused on institutional problems, such as inept or oppressive administration and poor service. In the first recorded university protest, Harvard students in 1766 rebelled over the quality of butter in the Commons. Later, college students organized demonstrations against *in loco parentis*, the notion that university officials were to act as parents of their students. Campus protest also took class forms, as students battled town residents over housing, pubs, and other cultural institutions. The lone exception to this apolitical student orientation was the formation of antislavery groups on some Northern campuses in the 1830s. Students also participated in major and minor political party activity, but these pursuits never constituted social movements. Only in the twentieth century, when universities and colleges became more influential civic institutions and the number of students reached a critical mass, did students engage in sustained politically oriented collective protest action aimed at changing government and university policy.

When student movements finally emerged, most dramatically in the 1930s, they were movements of the political left. Indeed, virtually all student movements of any size and influence have shared a left political orientation, though within the student left there have been serious and often destructive differences of opinion. An early movement organization was the Intercollegiate Socialist Society, founded in 1905 to promote socialism among youth. The myriad activities of the National Student League and the American Student Union in the 1930s aimed at eliminating poverty, expanding government social programs, promoting labor unions, securing free speech on campus, fighting racism and fascism, ending religious discrimination, and stopping war. In the 1960s, the Student Nonviolent Coordinating Committee fought segregation and racism, while Students for a Democratic Society fought U.S. imperialism abroad and poverty and exploitation at home. Students in the Coalition for a Free South Africa built shantytowns on the quad at Columbia University in 1985 to protest their university's investment in corporations doing business in apartheid South Africa. In the late 1990s, Students Organizing for Labor and Economic Equality sat in the administration building of the University of Michigan to demand that university officials develop codes of conduct for the corporations that provided its athletic apparel. As these examples demonstrate, students acted on many levels—university, local, state, national, and international—and targeted a range of private and public institutions, including government, corporations, universities, political parties, and social clubs.

Both the persistence of student movements and their left orientation are rooted in the nature of student life, the structure of U.S. education, and the distribution of power in U.S. society. College is a time for experimentation. Students test their political and intellectual principles, often over and against the doctrines that prevail on campus and in the larger culture. This has led many students to the ideas of the left, which, while marginal outside the university, have enjoyed some intellectual sustenance within it. Unlike most people outside the university, full-time students live and work collectively. They can discuss political ideas in classes, dormitories, dining halls, meeting rooms, and other social venues. Although increasing numbers of students must work to support their educational careers and although the university population includes more "older" people, students have relatively fewer responsibilities than other adults. This has left them more time to pick up radical ideas and put them into action.

Two somewhat contradictory aspects of higher education have contributed to the perpetuation of left-wing student movements. On the one hand, educa-

tional leaders have long seen themselves as cultivators of citizenship and their institutions as tools for instilling public spirit. This has encouraged students to investigate major social issues and take up collective solutions, which, in the American context, have usually been the province of the left. On the other hand, higher education institutions have always been training grounds for the market economy, teaching students the technical and social skills for success in the business world. Indeed, most students embrace this aspect of the university's mission, and activist students have always been a minority on campus. Still, the university's role as a major institution of cultural production and defender of the status quo makes it a target of student movements.

Although the students' location on campus has encouraged activism, it has not insulated them from the social divisions in American society. Indeed, the fishbowl aspects of campus life have often exacerbated these divisions, even among activists. Political division between Communists and non-Communists on international questions sundered the student movement in the late 1930s. Three decades later, factional struggles again tore apart the campus movements, though this time racial and gender conflict also split students. More recent student movements have not been large enough to develop the factionalism of their predecessors, and the previous activism of women students and students of color has introduced more equitable participation into the movements. Still, the social tensions of the larger society intrude upon student movements, even as they struggle against the sources of those very tensions.

One of the remarkable characteristics of American student movements has been their attention to international issues, particularly militarism. Students have mobilized against U.S. military action in Europe, Southeast Asia, Central America, Africa, and the Middle East. They have also protested against nuclear weapons, military recruitment on campus, and U.S. military aid to repressive regimes around the globe. Student activism has also targeted oppression and exploitation abroad, whether in the form of apartheid in South Africa, sweatshops in Asia, or death squads in El Salvador. Students have consistently publicized the connections between the plight of people in other countries and the actions of the U.S. government and U.S.-based corporations. In extreme cases, U.S. students have taken their activity abroad, as in the case of the human shields of the International Solidarity Movement in Palestine or the Brigadistas who went to Nicaragua to support the Sandanista revolution against the U.S.-backed Contras.

As the entries in this section show, the influence of student movements has been considerable, especially given the relative economic and political powerlessness of students. In the 1930s, campus activists mobilized hundreds of thousands of students for one-hour class boycotts and antiwar demonstrations on the anniversary of U.S. entry into World War I. They popularized the plight of miners, leading to a congressional investigation, waged hundreds of speech fights, leading to the reinstatement of dozens of students expelled for unpopular speech, and carried out struggles for federal student aid, jobs programs for youth, workers' rights, academic freedom, and racial equality. African-American students were in the forefront of the civil rights movement, and it was their lunch-counter sit-ins that sparked the largest and most effective wave of civil rights protests in the early 1960s, eventuating in the passage of the 1964 Civil Rights Act and the 1965 Voting Rights Act. The persistent protests of students against U.S. involvement in Vietnam played a major role in turning popular opinion against U.S. participation in the war. In the 1980s, the student demonstrations for divestment led more than 100 universities to withdraw investments from corporations doing business in South Africa. And in the late 1990s, students protesting against sweatshops convinced dozens of university officials and corporations to adopt codes of conduct respecting workers' rights. That students have accomplished so much outside their campuses is an illustration of their commitment, courage, and compassion.

Aaron Brenner

History of Student Movements

The most useful assumption one can make about student movements is that they have political orientations. This assumption distinguishes student movements from other campus-based social groupings (i.e., fraternities, sororities) that are not formed for the purpose of social change. The term *political orientation* can further be clarified in two respects: First, the movement's purpose arises from a concern with sociopolitical—including economic—conditions. Second, the movement seeks remedy through changes in policy or institutional arrangements. By "movement," social historians mean collectivities of students engaged in educational, legislative, and/or protest activities over a period of time and geographical space. To stretch the word "movement" to include a single instance of student protest or lobbying activity—or to events isolated to a single campus—renders the term meaningless. The term *student movements* suggests a trend or wave of activity sharing a related political focus and occurring on a number of campuses—even if the events are not coordinated as such. Student movements may arise for the purpose of contesting arrangements or policy at any number of political levels: the campus, the national or state level, the international arena, or the private market. Student movements are also not synonymous with student organizations; historically, however, movements have not emerged where no organizational structure, however inchoate, existed.

Many scholars tend to make the term *student movement* synonymous with *national student organizations* since centralized organizations provide a more stable subject of study. But this is a particularly insufficient way to grasp student movement development in the United States generally, and particularly in the era after the height of the movement in the 1970s. In the first case, the fragmentation and decentralization of U.S. higher education is broadly reflected in the marked discontinuity of organizational forms throughout the history of student activism. In the second case, after 1968 large segments of radical students eschewed national organizations on ideological grounds—however mistakenly. Therefore, an accurate overview of U.S. student movements, while valuing the role of national organizations, must remain aware of diffuse trends. U.S. student movements cannot be captured in the minutiae of a few organizational histories alone. Where organizational continuity has existed, it is generally the result of nonstudent-based organizational support. The "movement" spills well beyond the stability such exceptions present.

Related to the noncentralized character of the U.S. student movement is the challenge in discovering consistent measures of activity across time. University reports, mainstream press, student and alternative press accounts, organizational archives, personal memoirs, scholarly works, police reports, contemporaneous activist interviews, and reliable data, such as those available from the National Center for Education Statistics, are all useful sources of information. Studying student movements across time requires a flexible methodology and a degree of what John Dewey called "speculative audacity" when making generalizations.

Overview

Student movements have played a democratizing and radicalizing role in American culture and politics. In specific cases, student movements in the United States have been key players in challenging and ending regressive government policy in both domestic and foreign policy arenas. Though consistently led by a small minority of the overall student population, politically active students have earnestly sought to resolve, reform, or eradicate the most contradictory aspects of American democracy. Although student protest in America dates back to the colonial college when stu-

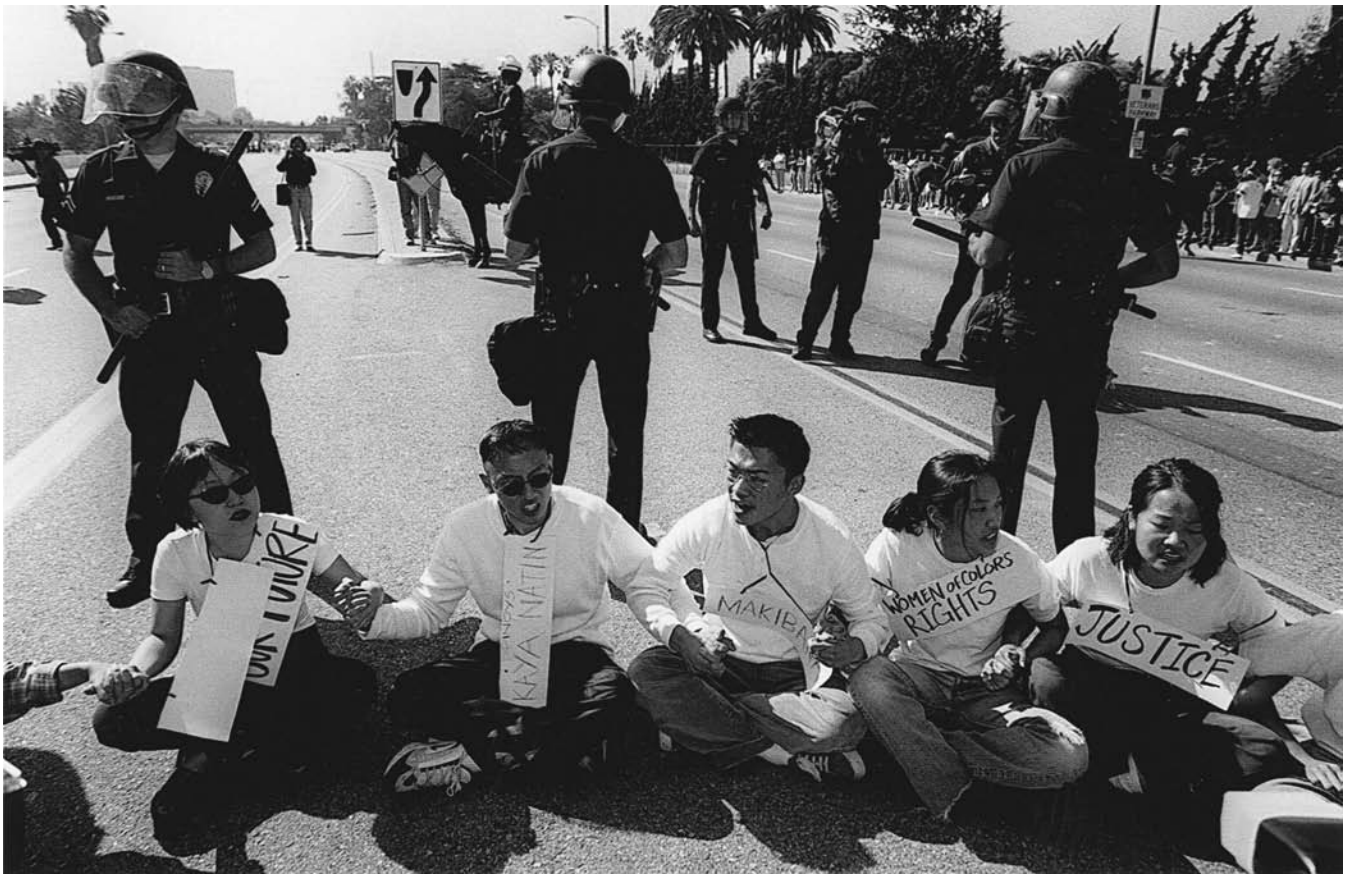
dents agitated against the Crown and the harshly punitive powers of rectors, student "protests" showed signs of becoming student "movements" after the Civil War when changes in American higher education in the age of industrialism began to take root. The modern U.S. student movement, originating in the early 1900s and emerging as a potent political force by the 1930s, has assumed an increasingly distinctive place in the nation's consciousness. By the end of the 1960s, the phrase "student movement" conjured images of both radicalism and repression—lunch counters, Freedom Rides, the 1964 Berkeley Free Speech Movement, the antiwar protest at the Democratic National Convention of 1968, and the tragic slayings of student protesters at Kent State and Jackson State. The Free Speech Movement took place at the University of California at Berkeley in fall 1964, as hundreds of students occupied the administration building, demanding the expansion of student rights to use the campus for political activity. Students and others protested at the Democratic National Convention in Chicago in late August 1968 in opposition to the U.S. war in Vietnam. The police and National Guard dispersed the antiwar protests led by members of Students for a Democratic Society (SDS), the National Mobilization to End the War in Vietnam (MOBE), and others with tear gas, clubbing, and the arrest of many protesters. On May 4, 1970, the Ohio National Guard opened fire on a peaceful demonstration against the Vietnam War at Kent State, killing four students. At Jackson State, in Jackson, Mississippi, police fired at a demonstration of about 100 students, killing two students. Student movements in the United States have become synonymous with the forces of political liberalization, economic justice, and cultural freedom.

There have been two "great" periods in which the U.S. student movement became a national force: first, in the Great Depression years, under the direction of the American Student Union, when students organized against war, for civil rights, and for the economic needs of students and youth; and second, in the 1960s, under the direction of the Student Non-Violent Coordinating Committee (SNCC), when students waged campaigns for desegregation and civil rights, and later, under the direction of Students for a Democratic Society (SDS), when students agitated against U.S. involvement in the Vietnam War. Though certainly these two periods show great upsurges, there are additional periods—such as the 1980s anti-apartheid movement and the contemporary student movements against sweatshop labor, military engagements, and spending, and for increased spending for higher education—that present noteworthy and widespread student movement activity. The events of the 1980s were credited with playing important roles in raising awareness of apartheid, sweatshop labor, and U.S. military intervention abroad. Student protests have also led to the rollback of proposed tuition increases. In both the 1980s and today, students have demonstrated a strategic awareness of their unique power qua students and have applied that leverage in creative ways that have brought success. For instance, students set up tent cities in protest against university investments in South Africa in the apartheid era. More recently, students have pushed forward codes of conduct, exposing university complicity in sweatshops through bearing their schools' name on clothing manufactured in sweatshops. Others have organized human rights, social justice, and preservation of Affirmative Action.

Since the later part of the nineteenth century when an embryonic student movement was first identifiable, the themes of civil rights, civil liberties, peace, education access and reform, and economic justice have predominated. The first national student-based organization in the United States was the Inter-Collegiate Socialist Society founded in 1909 by Upton Sinclair, the celebrated author and Socialist.

In both "great" periods of the 1930s and 1960s, the national waves of student activism in the United States were left-led and spread outward following the formation of national student organizations. Indeed, student movements in the United States have always formed around a left-liberal axis. The left-led national student organizations of the 1930s and 1960s, however, were most successful in mobilizing large numbers of students when they adopted pragmatic strategies that de-emphasized narrow ideological positions and instead emphasized the language of democracy, rights, and justice when contesting U.S. policies. Beyond any specific success or loss, U.S. student movements have had profound reverberations on political culture, discourse, and awareness—on and off campus.

Although U.S. student movements often have been unfavorably compared to their more spectacular counterparts in developing nations or even to similarly advanced capitalist nations, it is a mistake to measure the impact of U.S. student movements against the standards set by student movements in Asia, Latin America, or even France in 1968. In *Student Politics in America* (1997), Phillip Altbach states, "The American student movement contrasts rather



On October 23, 1996, UCLA students stage a sit-in on Wilshire Boulevard in Los Angeles to protest a state referendum aimed at abolishing Affirmative Action. *(AP Wide World Photos)*

dramatically with student movements in many other countries, especially with student movements in developing nations." In connecting the two ideas, Altbach plainly states that unlike their international counterparts, U.S. students have never "been effective in producing a major political change in the United States." In doing so, analysts simultaneously ignore the unique obstacles presented to mass student organizing in the United States and submerge the real gains—and potential—of U.S. student activists. Moreover, such analyses have the unintended side effect of perpetuating the seductive but illusory ideal of student revolutionism—an ideal that has never suited the U.S. context. Indeed, the tail end of the U.S. student movement of the 1960s is a testament to the tragedy of revolutionary idealism and student vanguardism in the U.S. context. Both Weatherman Underground, the most radical and confrontational faction of the Students for Democratic Society, and segments of the Black Panthers fell prey to Third World revolutionary romanticism and types of dogmatism that were opportunistically flamed by U.S. government agents in Counter Intelligence Operations (COINTELPRO). By the late 1960s, the contemporaneous anti-imperialist armed liberation struggles of Africa, Asia, and Latin America captured the imagination of segments of the American student left who were searching for ideological direction and a sense of "certainty." Freedom of Information Act (FOIA) files indicate that the Nixon administration's COINTELPRO, aimed at disrupting the social movements of the 1960s, instructed operatives to encourage the heightened militancy. Together, these forces produced bitter feuding, violence, isolation, and movement fragmentation The evidence shows that COINTELPRO infiltrated radical student organizations seeking the end to the Vietnam War, civil rights, and greater equality, through planting agents provocateurs to encourage the groups to commit illegal activity. As a result, members of the student groups were arrested,

and the organizations became divided, eventually losing their power and momentum.

Although U.S. student movements have not served as mass vehicles for revolution, they have at rare moments commanded large portions of the student body in campaigns against war, for civil rights, and for educational reform. Another important characteristic of U.S. student movements is their unique resistance to the forces of reaction, a claim that neither the student movements of many developing nations (past and present) nor the students of Fascist Europe can make with equal candor. Student activism in America, once past the colonial and pre–Civil War period, presents no authentically conservative moments. The one exception in U.S. history may be the role that Southern white students played in the Ku Klux Klan following the Civil War. Although S.M. Lipset reports in *Rebellion in the University* (1972) that "The Klan and other white supremacy groups were strong in numbers in the universities," the Klan was never a "student movement." This activity was regional rather than national in character.

The first national, politically conservative student organizations such as the National Student Committee for the Loyalty Oath and Young Americans for Freedom in the 1950s and early 1960s were the creation of adult conservatives trying to combat the widespread influence of radical and liberal student movements in the first half of the twentieth century. That conservatism has frequently marked the broader culture, and therefore much of campus culture, is not in question. More important, however, the hallmark of U.S. student movements is that they have been consistent, and often dramatic, counters to such conservatism.

Since World War II, demographics have facilitated the ability of student movements to mobilize large numbers of youthful bodies in the service of a cause. At the same time, movement analysts tend to view students primarily as a symbolic force or as effective disrupters but not as creators of public policy—the way, for example, labor, the civil rights, environmental, or women's movements are viewed. Although it may be true that what the governing elites in the United States (and the world over) fear most about the power of student movements is their passionate willingness to break rules and to defy authority en masse, state repression of such eruptions has always been a swift and largely effective response. Such was the case in the streets of Chicago in 1968 when police violently reacted to the thousands of youth and students who converged on the Democratic National Convention that year despite their being denied a permit; the student slayings by National Guardsmen on the Kent State campus in 1971 also illustrate the point. It is equally true that student disruptions as such can indirectly affect public policy. But these observations do not justify the persistent undertone in many accounts that students are incapable of anything more than disruption. Can student movements in the United States be effective creators of public policy? Clearly, the possibility exists, but their potential to do so depends on students' reasonable speculation as to what public policies they are more likely to affect, using what tactics and strategies, and under what circumstances. A large determinant of the potential of any student movement for achieving this kind of positive impact is whether the movement itself practices a reflexive awareness of these very questions in pursuit of its vision and values.

Patterns in Higher Education and Student Movements

Although private institutions of higher learning are the first and oldest institutions of higher learning, educational institutions resembling a "national" or public system first emerged through the federal granting of lands and money to states for educational purposes under the Morrill Acts of 1862 and 1892. The United States has never adopted a national university system but instead effected national patterns through federal grants administered through the states. These policies were inspired less by the Jeffersonian vision of an educated democracy than by the modernization needs of farmers and growing industries in the early industrial period. With rare exception, the state colleges founded in this era, though more affordable and marginally more democratic than the private institutions, were still costly and reserved for the already upwardly mobile segments of the middle class. It was also in this period that the first historically black institutions were founded to fill the needs of an incipient black bourgeoisie.

By the turn of the twentieth century, progressive American educators, inspired by the scientific and other intellectual advances made under the centralized university systems of Germany and France, became advocates for graduate research institutions. Advocates of specialization and advanced learning battled with traditionalists who still held sway over the majority of private institutions. The research university mission eventually was taken up by the founding of new private institutions, such as Johns

Hopkins, and encouraged with federal research dollars and private endowments channeled into the existing land grant universities. These changes opened the universities to both increased revenues and expansion, and paved the way for the next shift in function, which would be an early "massification" of the universities in the first few decades of the twentieth century. This early massification was fueled by the needs for a managerial class in an increasingly modernizing society. The proliferation, and or expansion, of a second tier of state and municipal colleges—some of which, like those in Detroit and New York, charged no tuition—provided a sharp counterpoint to the elite student bodies and traditions at many American universities.

The American student movement emerged as a politically distinct force in this early twentieth-century period. Perhaps not unsurprisingly, by the Depression years, it drew much of its radical character from the new class of young people populating the public universities. This was the first mass student body in the United States, and the conditions of the Depression provided a context favorable to a radical agenda focusing on both peace and the economic needs of students and youth. Not again until the late 1950s and early 1960s would expansions in higher education (triggered by the Servicemen's Readjustment Act of 1944, the postwar birth rates, and economic advances) generate the conditions for a second wave of protest—only this time the relative prosperity of the times gave emphasis to issues of civil rights and peace and not economic demands. The new "multiversities," tied increasingly to the techno-economic demands of industry, became sites of struggles for a new generation questioning the integrity of American democracy. Whereas deprivation inspired the students of the 1930s, the relative security of students in the 1960s led them to take up the legal and moral basis of American apartheid and to question America's role in the world as defender of "democracy."

As such, students in the 1960s, as beneficiaries of unprecedented federal support for higher education, focused not on education rights but on civil rights for African Americans and the morality of the war in Vietnam. Although SDS is the most well known of the organizations, student antiwar and civil rights groups proliferated on campuses throughout the country. The 1960s can be considered an exception as the national government was more committed to funding for higher education. However, student support began to shrink and evaporate in the last three decades of the twentieth century as the national government reduced its commitment to higher education. Thus, funding for working-class young adults dropped precipitously as direct assistance became replaced by a multitiered loan system in the 1980s and 1990s. Similarly, since the 1960s, the states have felt the pressure of federal cuts to higher education and have had to balance the costs of state universities by increasing taxes and tuition, reducing working-class access to higher education. Universities in the 1970s and 1980s reflected a type of pluralism in which a more racially and gender-diverse student body could choose from an increasingly broad, though specialized, course of study, though campus administrative prerogatives were strengthened. In response, beginning in the 1980s, public universities have increasingly relied on private market investments and private corporations for resources and incentives. These changes in funding sources have led students to pursue new strategies for reform and have shifted the focus of campaigns. Students increasingly adopt market-related strategies (divestment campaigns, boycotts, etc.) while simultaneously challenging the corporatization and privatization of higher education in America. The best contemporary example of this is the student antisweatshop movement of the late 1990s and early twenty-first century, though campaigns for increased funding for higher education frequently accompany these efforts. United Students Against Sweatshops is perhaps the most well known of the growing number of campus-based organizations working to end sweatshops abroad and at home and to improve conditions for other workers.

Six Periods of U.S. Higher Education

As the main patterning institution in the lives of college students, universities and colleges provide the ground for student movements. Universities and colleges themselves reflect national higher education policy, which in turn reflects national economic goals and expectations. Higher education has expanded dramatically: In 1790, approximately 1 percent of the 3.9 million national population attended fewer than 37 institutions of higher learning; in 2003, an estimated 33 percent of eighteen- to twenty-four-year-olds—or more than 14 million students—attended more than 3,600 institutions of higher learning. The student body today is more sociologically diverse in every way. As the American higher education system has adapted to the pressures of modernization, universities and colleges have changed in size and function. The techno-economic pressures on universities—and their varied responses to those pressures in any given era—have

directly shaped the context of student politics in both positive and negative ways. Indeed, the phenomenon called "student movements" is itself a product of national education policies following the Civil War in which industrial and modern agricultural needs were central. Although the emergence of the student movement and student thinking cannot be said to be a mirror of changes in the economy and technology, the major periods of higher education growth do have correlates to student movements' developments. These periods in higher education partially describe the structural context within which student movements must operate.

Five broadly descriptive periods indicate developments in the function and structure of U.S. higher education: First, the period stretching from the colonial period up to the Civil War can be characterized as private elite higher education. Although a few state charters were granted universities in the late eighteenth century—including Thomas Jefferson's University of Virginia, the University of Georgia, and the University of North Carolina—and several more emerged in the first few decades of the nineteenth century, the vast majority of colleges were denominational private institutions. All the private institutions, and even the public institutions, in this period were accessible to eligible elites as a result of the need for prior training or financial resources to attend.

Second, the period beginning in 1862 and lasting until the turn of the century opened up higher education to nonelite sectors of American society. This change is characterized by the chartering of federal land grant institutions in the states and a focus on industrial and modern agricultural skills. Most colleges, however, remained private. Enrollments in this period rose from 1 to 2 percent of eighteen- to twenty-four-year-olds.

The third period, 1900 to 1930, is one that evidences a continuation of growth in public institutions (including the free municipal systems in New York City and Detroit) but with a new emphasis in both private and public institutions on advanced research and graduate training. This emphasis resulted in the expansion of higher education both physically and functionally, and increased revenues from private and public investment. It is in this period that enrollments rose from 2 percent to 7 percent of eighteen- to twenty-four-year-olds. This is also the period in which an embryonic student movement emerged, setting the stage for the upsurge of student activism in the Great Depression years.

Despite the predictable contractions of enrollments induced by the Great Depression and World War II, this fourth period, from 1930 to 1945, is more accurately characterized by the emergence of an early mass higher education system resulting from the expanded federal role in higher education brought on by the New Deal. At the end of the 1930s, 9 percent of eighteen- to twenty-four-year-olds were enrolled in college (1.5 million), and ten years later, 15 percent (or 2.4 million) were enrolled. Student movements in the 1930s agitated vigorously to expand New Deal programs assisting students and youth, but the single most influential program in this period was the Serviceman's Readjustment Act of 1944 (the "GI Bill"). The GI Bill induced short- and long-term changes in the demographics of the student body, while universities scrambled to expand curricula and facilities. Free college education, low-interest federal housing loans, and an expanding U.S. economy created conditions under which a "baby boom" followed the soldiers' return from war. Institutional and personal expectations of federal assistance for higher education were established in this period.

A fifth period, spanning the years 1945–1960, is one in which a legitimate mass higher education system emerged. Though clearly decentralized, public institutions expanded significantly in this period to accommodate the growing demand for higher education of postwar America. Enrollments rose from 15 percent to 24 percent in this period. A full 20 percent of university and college revenues came from the federal government, an all-time high, with some of the funding earmarked for research and federal training programs. Toward the end of this period, a mass, diverse student body showed signs of renewed political engagement, which dramatically coalesced in the 1960s.

This sixth period, which emerged in the 1960–1969 period, is aptly captured in former University of California president and higher education policy expert Clark Kerr's term *multiversity*. The multiversity is a multifunctional university system, substantially defined by the new administrative and managerial tasks of serving an exploding student body; by 1969, 35 percent of all eighteen- to twenty-four-year-olds were enrolled in institutions of higher learning. To illustrate the growth, in 1960 there were more than 3.7 million students in higher education; by 1969, there were more than 7.8 million. The rebellions that rocked American campuses in this era are variously connected to the tensions arising from competing administrative and educational functions in American democracy. By the end of the decade, federal support

for higher education was declining; the traditional sources of states taxes, tuition and private endowments, became more important given the need to maintain the expansions that (the now dwindling) federal dollars instigated.

In the period between 1970 and 1990, institutions of higher education responded to the explosions of the 1960s by adopting a pluralist model, stressing diversity within corporate governing practices. With enrollments steadily increasing to 45 percent by 1979, universities and colleges continued to expand despite the continued decline of federal support: by 1990, less than 9 percent of higher education revenues came from the federal government. Universities reached out for enrollments by developing programs suited to part-time and nontraditional students. The two-year college system also expanded between 1970 and 1980. Administrative prerogatives were shored up, and decision making—with respect to everything from investments to discipline—became increasingly executive in character. The implementation of a national student loan system in the Reagan era shifted the burden of rising tuition costs to students themselves. The relationship between a college education and decent employment grew stronger, and the increasingly diverse student body showed signs of economic strain in the late 1980s. So too did state budgets, and state cuts to higher education exacerbated the growing dependence of universities on corporate dollars. University reliance on private endowments, investments, and corporate contracts increased. Despite a stagnant economy, student movements emerged that both contested and leveraged the new market influences on campus. The success of the university divestment movement of the mid-1980s illustrates this awareness. Student organizations have encouraged universities to divest investments in South Africa and, more recently, have opposed investments in companies engaged in sweatshops and child labor, or violating basic human rights.

The contemporary situation of higher education seems increasingly dependent on the forces that dominated under the pluralist model but in more severe form. Student indebtedness has increased dramatically, despite modest increases in funding for higher education during the era of President Bill Clinton. The situation of higher education in the 1990s and early twenty-first century is best described as neoliberal in character. As a term, neoliberalism describes a political response at the level of the nation-state to the competitive forces of globalization. Neoliberal policies typically unleash the free market through privatizing public services, reducing regulations, and dismantling welfare state programs such as public relief, healthcare services, and old age pensions. Student movements at the turn of the century show a strategic and tactical awareness of the consequences of neoliberal polices and are seeking to reverse these trends through protest against international organizations that promote neoliberal policies, including the International Monetary Fund (IMF), World Trade Organization (WTO), and other organizations dominated by corporate interests.

Student Movement Effectiveness

The case can be made that students' greatest power lies in forwarding an agenda of educational and economic security for young people. The argument suggests that these are students' "natural" issues, which, it should follow, resonate most deeply with a broad number of students. Historically, however, aside from the 1930s, a national vision of just such an agenda has not been evident. This is in part the effect of education and related social and economic policy increasingly becoming the province of the states—particularly as the New Deal policy structures have declined. Although state-based student efforts have percolated, the practical realities of American federalism have made national thinking and national coordination difficult for American students. Interestingly, student movements of the second half of the twentieth century had great national success on civil rights and peace issues. Their success on this agenda is better accounted for by an understanding of the ideological and demographic dimensions of the era.

Regardless of issues, student impact seems to be strongest under the following conditions: (1) when student actions and mobilizations are coordinated within the context of a broader but related organizing drive and/or (2) when the students' role is tailored to maximizing their leverage within the university while aiming to leverage the universities' institutional influence in a more decisive context—for example, the national governmental context or the context affecting decisions on global capital. Examples of the strategic use of student power include: (1) the antiwar campus protests of the 1960s aimed at ridding universities of military research contracts such as the MIT, Rutgers University, and University of Wisconsin-Madison campaigns; (2) the 1980s university divestment campaigns, which in 1985 alone resulted in 110 universities withdrawing their investments from companies doing business in apartheid South Africa; (3) and the contemporary anti-sweatshop campaigns, which have

resulted in over 100 universities adopting fair labor codes of conduct in the purchase of college apparel. In these cases, students maximize their position within universities in order to support other social forces aiming to reshape national and international policy. Ironically, U.S. student movements have yet to apply these strategies to their "natural issues" and have neither enjoyed nor created a context in which potential allies, such as labor, are focused on redirecting national higher education policies.

Although U.S. students have not been a revolutionary force, such a standard fails to appreciate that as a segment of American society, student activists have not only been temperamentally progressive and radical, but also have grown increasingly sophisticated about their social movement power and potential over time. With peaks and valleys punctuating the size, coordination, and ideological coherence of campus-based activism since the 1930s, U.S. students have demonstrated a generational learning curve with respect to the relationships among ideology, strategy, and tactics in the context of student activism. This "learning from the past" is reflected in the way that current student movements think complexly about the position of students, the changing university, and the broader political and economic context, both national and global. For the major student movements today, there is no single "subject" of history—not the worker of the 1930s nor the existential subjects (i.e., youth, blacks, women) of the 1960s and 1970s. Left thinking among students today is unaffected by the old orthodoxies of the 1930s and the profound identity divisions of the late 1960s.

The period between the 1960s and the twenty-first century is probably one of the most complex and yet formative periods in U.S. student movement history in this respect. Both the 1970s and 1980s were periods of substantial student activism: campaigns for curricular reform reflecting a more diverse student body, antinuclear weapons and energy campaigns, tuition protests, anti-CIA campaigns, the anti-apartheid movement, campaigns for civil rights on campus, environmental awareness efforts, opposition to U.S. policies in Central America, and sexual autonomy, reproductive rights, and AIDS awareness campaigns were evident nationally. In many cases, student movements linked up with broader organizations, such as CISPES (Committee in Solidarity with the People of El Salvador), NARAL (National Abortion Rights Action League), and ACT UP!, an organization seeking to gain greater support for efforts to diminish the spread of HIV/AIDS. Despite the retrenchment that is typically portrayed, this is a period of far-flung single-issue activism, which even if possible to measure, taken together might suggest a wider engagement than the more spectacular 1960s. Though largely localized, the prolific single-issue campus organizing of the late 1970s and 1980s drew few parallels to the 1960s until the anti-apartheid "Divestment Movement" swept American campuses in the spring of 1985. This successful movement, however, brought to the fore the unresolved organizational and ideological dilemmas which the 1960s breaks with both the Old Left and the early civil rights strategy left in their wake. Student activists in the 1980s struggled with these legacies in a time of serious economic challenge for public universities and lower-income students. Outside of (and sometimes inside of) the campus anti-apartheid campaigns, the 1980s were a truly difficult time for unity of any kind among U.S. students.

The next wave of student activists seems to have taken some cues from the fragmentation, both ideological and organizational, of that period. It was also a time in which U.S. students, for the first time since 1917, were largely unaffected by U.S. anti-Communism. The divisiveness of both identity politics and the residual sectarianism of Socialist and Communist groupings that marred the landscape in the 1980s seemed either untenable or entirely irrelevant by the mid-1990s.

Current student movements appear more sophisticated in the absence of such pressures. They also seem to have retained the great contributions of both the celebrated eras of student activism in the 1930s and the 1960s. Ideologically, commitments to racial justice, feminism, sexual autonomy, environmentalism, and economic democracy and equity are assumed values in the contexts of student movement struggles. Like their predecessors of the 1930s and 1960s, student movements of the early twenty-first century can be identified as anticapitalist (that is to say, they are critical of the accumulations process under globalization), while also interested in the development of more equitable and accountable forms of national and global governance of the economy. Students today also seem to grasp the importance of strategic alliances with broader social movement forces and the need for multipronged strategies and tactics. These lessons, it can be argued, have drawn from three sources: (1) the early popular front practices of the American Student Union of the 1930s; (2) the loose coordination between students and established civil rights organizations in the early 1960s; and (3) the international and national coordination between cam-

pus groups and established human rights groups, the Rainbow Coalition and the African National Congress, in the early and mid-1980s. In the early twenty-first century, radical ideals—democracy, economic justice, and internationalism—combine with pragmatic strategies, including boycotts of campus apparel made in sweatshops, student strikes against unilateralism and militarism, university divestment campaigns, and campaigns for increases in state and federal education funding. At the same time, student movements flexibly employ tactics forged in earlier periods—the boycott, the strike, and symbolic parades, all from the 1930s, in combination with creative, nonviolent direct action, from the 1960s. Students now seem to favor nationally coordinated campaigns but continue to distrust formal national organization in favor of local autonomy. This mixed bag of tools and tactics is now applied in the context of universities under the pressures of political neoliberalism and economic globalization with remarkable savvy.

This more mediated and historical understanding of student power is somewhat remarkable given the lack of intergenerational institution building that marks the American Left. The increasing attention given to student movements (and social movements generally) in academic and journalistic publications has made a good deal of this possible. Information technology's speed and breadth is also an enormous asset for student movements today in fulfilling their

desire for both "history" and communication. Universities as anchors for the free flow of information in society provide both the liberal traditions and the on-campus hardware for such access to the past and future. Students, as compared with many sectors of society, are uniquely connected to the traditions and technology that might enliven the beleaguered critical functions of the public sphere. Through university curricula—including social movement studies—and technology services, students are especially privy to the information and practices required of citizenship in our era. To the degree that universities continue to fulfill the liberal function of transmitting political knowledge and civic engagement practices, some degree of student activism is to be expected. Indeed, efforts to protect this threatened function of the liberal university have been an increasing focus for student movements since World War II—an intuitively sensible, yet politically radical, project in and of itself.

Despite their relative technological and informational advantage, students are still faced with the obstacles to mass organizing presented by a highly disparate and decentralized political and educational system. At the same time, student protest in the post-1968 world appears more flexible, self-consciously experimental, and ideologically reflexive about student position and power. Currently, students seem concerned with questions of international governance in matters economic and military. As such concerns mix with cuts in education funding and reductions in social welfare support of all kinds, the new student movement disposition suggests that the first decade of the twenty-first century will be significant in the ongoing history of the U.S. student movement.

Students for a Democratic Society Movement

A Profile Emerges 1960

Students for a Democratic Society (SDS) was a campus activist organization created in response to conditions of injustice and inhumanity that its founders, as national and world citizens, decried. SDS had its origins in the youth auxiliary of the League for Industrial Democracy (LID), a social-democratic political alliance. Although it may well have been that SDS spearhead Robert Alan ("Al") Haber hoped to form SDS when he departed LID, he could not have known that he and his SDS colleagues would give life to one of the most visible national student movements of 1960s America. The organization got its start at the 1960 annual congress of the National Student Association (NSA), convened that year at the University of Minnesota. Gathered at the congress were student activists, both liberal and radical, for it was only later that NSA would become exposed as an organization funded by the Central Intelligence Agency (CIA) to penetrate and compromise student activist groups of the day. While there, Haber tried mightily to mobilize attendees with the SDS agenda and a document entitled "The Student and Total Community." Within a year or so, he had recruited a devoted core of members from the nation's colleges and universities.

SDS emerged in the aftermath of the previous decade's climate of suspicion and anti-Communism later known as McCarthyism. The chill of the Cold War and the Red Scare had sent many left-identified thinkers underground, but in no way was their dissent quelled. To the contrary, this historical moment sensitized young people in particular to the era's pressures for political orthodoxy and social conformity, setting the stage for a turbulent decade of student rebellion, in which such boundaries would be actively, even flamboyantly, transgressed. As if to counter the postwar period's mixed feelings of complacency, alienation, and helplessness, members of SDS dared to contend that a defeatist outlook was not the same as a realistic one. They maintained that doubt was intrinsically neither more sophisticated nor more accurate a stance than hope.

Framing an Agenda 1961–1962

SDS operated as a multi-issue group associated with the New Left, and one known both for its commitment to human potential and for its philosophical movement away from top-down decision making. By contesting a prevailing social order, SDS joined a larger countercultural movement. The student branches of this movement challenged the forces of the "establishment," with its disproportionate concentration of power in government, industry, the military, and the universities. SDS protested the dehumanizing effects of such institutions and their hegemony by empowering students as citizens and agents of change. Like other youth-oriented radical groups of its time (including Campus Americans for Democratic Action, Student Peace Union, Young Democrats, Young People's Socialist League, and Youth International Party), SDS found it important to question authority, affirm equality, and oppose the war in Vietnam. "America and the New Era," a 1963 SDS policy statement, conveyed to prospective members the group's purpose and its invitation to collective protest in this way:

> Students for a Democratic Society is an educational and social action organization dedicated to increasing democracy in all phases of our common life. It seeks to promote the active participation of young people in the formation of a movement to build a society free from poverty, ignorance, war, exploitation and the inhumanity of man to man. Won't you join with us?

The goal was to reinvest in "participatory democracy," assert the dignity and personal freedom of every individual, and speak to the sanctity of each

person's right to a role in decision making in matters shaping one's experience or bounding one's liberty. As the slogan on SDS buttons proclaimed, "Let the People Decide." For this reason, political involvement became more for SDS than a way to advocate for candidates or legislation. Politics came to represent a means to forge community, clarify choices, mobilize dissent, reform social relations, and realize democratic ideals through cultivation of an informed and entitled public.

SDS's methods typically combined progressive debate with political action and cultural resistance. Since decentralized leadership was the objective, campus-based chapters rather than a national office would translate SDS ideas into practice, even when the cause was national. Protests targeted complex issues such as racism and the Vietnam War. SDS wasn't merely a vehicle for conscientious objection, however. Members as often worked to advance embattled causes. SDS members supported the First Amendment, civil liberties, civil and human rights, public responsibility, peaceful conflict resolution, and humane policymaking. The organization dedicated itself to a utopian notion of a society free of poverty and therefore rid of class strife; marked by racial equality and therefore not divided along color lines; characterized by pacifism and therefore nowhere implicated in war; dedicated to free speech and therefore no longer subject to the voices of the few. As the first SDS members commented in their founding statement, "If we appear to seek the unattainable, it has been said, then let it be known that we do so to avoid the unimaginable." The membership of SDS preferred rejection for belief in the possibility of systemic change and social transformation than acceptance for their failure to believe in this vision.

Some have claimed that the energy behind SDS's formation came, at least in part, from the so-called red diaper babies—children raised by labor movement veterans, Communists, and Socialists aligned with the Old Left. Others note the "prairie power" of SDS's subsequent membership, drawing strength and numbers as it initially did from the American Midwest. In time, however, SDS membership, both formal and informal, would reflect a wide demographic spectrum of students working on behalf of social justice.

Surely the radicalism of the 1930s, with its own wave of campus activism, shaped the climate for SDS. Another strong, and more contemporary, influence on SDS founders was the civil rights movement. The Freedom Rides, sit-ins, and marches of civil rights activists offered SDS a primer on nonviolent protest, principled dissent, and civil disobedience. In particular, the Student Nonviolent Coordinating Committee (SNCC) proved both an exemplar and, later, a partner in the promotion of common concerns, including racial equality, integration, and voter registration. So kindred were the causes of the two groups that passages from the founding statement of SNCC could as easily have described SDS:

> Through nonviolence, courage displaces fear; love transforms hate. Acceptance dissipates prejudice; hope ends despair. Peace dominates war; faith reconciles doubt. Mutual regard cancels enmity. Justice for all overcomes injustice. The redemptive community supersedes systems of gross social immorality.

Though distinct as organizations and constituencies, SNCC and SDS members forged a shared understanding that political revolution required change in consciousness as well as conduct.

In addition to drawing inspiration from movement culture, the founders of SDS took cues from numerous published writers of social and political commentary. C. Wright Mills, with his views on the immorality of power and the responsibility of the intellectual, proved most compelling. Along with writings by Mills, works such as Vance Packard's *The Hidden Persuaders* (1957), David Riesman's *The Lonely Crowd: A Study of the Changing American Character* (1950), William Whyte's *The Organization Man* (1956), and Albert Camus's *The Rebel* (1951) helped motivate SDS organizers to reconstruct democracy so that its practices aligned with its principles.

The galvanizing moment in SDS's formation was the 1962 framing of the Port Huron Statement, so named for the Michigan location of the first SDS national convention, at which the text first bore group scrutiny from June 11 to 15, 1962. Although SDS member Tom Hayden served as the principal author of the statement, consistent with SDS tenets of inclusiveness, thoughtfulness, and reflection, it was not ratified until the membership engaged in vigorous dialogue and the draft version underwent painstaking revision to become the sixty-three-page text that remains. The Port Huron Statement represented a combination of mission statement for direct democracy and manifesto for the New Left. This document refused cynicism in its critique of mainstream America's institutions by issuing a call for grassroots involvement in reclaiming democracy for the people. In its hopeful language and idealistic rhetoric, the Port Huron Statement, intended as a living statement rather than a fixed doctrine,

TOM HAYDEN (1939–)

Tom Hayden was born in Royal Oak, Michigan, on December 11, 1939. One of the best-known student radical leaders of the 1960s, he was a cofounder of the Students for a Democratic Society (SDS) in 1960 and served as president of SDS (1962–1963). The group operated under the principles of the Port Huron Statement, a manifesto written by Hayden and cofounder Robert Alan Haber and issued in 1962. The sixty-three-page political platform provided a thoughtful critique of the Cold War and the materialistic complacency of postwar American life. The Port Huron Statement proposed that universities should be the starting place for a new movement for "participatory democracy." That goal, never precisely defined, animated SDS and aimed generally toward transferring power from representative institutions to individuals and communities.

Besides his work with SDS, Hayden was cofounder of the Economic Research and Action Project in 1964 and leader of the Newark Community Union Project (1964–1967). SDS grew slowly until the escalation of U.S. involvement in Vietnam in 1965. The group organized a national march on Washington, D.C., in April 1965, and, from about that period on, SDS grew increasingly militant, especially with regard to issues relating to the war, such as the drafting of students. Tactics included the occupation of university and college administration buildings on campuses across the country. In 1968, Hayden and six others were arrested, charged, and sentenced for inciting riots during the Democratic National Convention in Chicago. The Chicago Seven later had their convictions overturned. By 1969, SDS had split into several factions and soon began to disintegrate, and two years later Hayden moved to Los Angeles.

In the 1970s, Hayden married actress Jane Fonda, and together they worked on environmental and antinuclear issues. He ran for U.S. Senate in California (1976), was founder of the Indochina Peace Campaign, was founder and chairman of the California Campaign for Economic Democracy (1977), and served as chairman of the California SolarCal Council (1978–1982). He was elected to the California State Assembly in 1982 and the state senate in 1992, where he continued his fight on behalf of the environment and minorities. He retired from the legislature in 1999.

James G. Lewis

struggled to overcome dogma with vision as it sought to distinguish SDS from the hard-line or Old Left.

PRAXIS 1963–1968

At its prime, SDS positioned itself as the populist voice of a generation and participated in many liminal moments of the countercultural movement, from 1964's Mississippi Summer and Berkeley's 1964 Free Speech Movement to SDS-sponsored events such as the 1965 antiwar march on Washington, D.C., and the 1968 Columbia University uprising. Most everywhere students gathered to reconstitute the university as "a significant source of social criticism and an initiator of new modes and molders of attitudes," SDS exerted a presence.

By the mid-1960s, SDS had a high political and media profile as an organization. One of numerous distinctive projects sponsored by SDS was the Economic Research and Action Project (ERAP). This initiative took SDS beyond the campus and into the community, as face-to-face organizers worked to provide favorable circumstances for disenfranchised Americans—especially poor people of color—to realize and exercise their power as citizens. The emphasis was on local action to address local needs, primarily on political and economic issues. The premise behind ERAP was that to act on one's duties and rights as a citizen, one must have access to housing, employment, education, and welfare protections. Although SDS had always been hospitable to the movement for civil rights, ERAP represented a bolder move toward direct action. It offered an opportunity for SDS to carry its mandate of "participatory democracy" beyond the university and into the wider world. The SDS agenda was not, however, exclusively national in scope. SDS also sponsored such ventures as the Peace Research and Education Project (PREP), which exposed the loans American banks continued to make with the South African government during its period of segregation, known as "apartheid." Whether challenging the military-industrial complex at home or oppression elsewhere, SDS members labored to fulfill Mahatma Gandhi's dictum: "be the change you wish to see in the world."

DECLINE 1969–1972

Although accounts vary in nuance and timeline, most cite the 1969 SDS national convention as the critical moment, whether as portent or proof, of the organization's dissolution. Although the membership

PORT HURON STATEMENT, 1962

The Port Huron Statement, written by Tom Hayden in 1962, a student at the University of Wisconsin, is the founding statement of Students for a Democratic Society, dedicated to the elimination of war, famine, and social upheaval. The program is based on motivating young people to understand the world beyond American borders and to take direct action to change society.

We are people of this generation, bred in at least modest comfort, housed now in universities, looking uncomfortably to the world we inherit.

When we were kids the United States was the wealthiest and strongest country in the world: the only one with the atom bomb, the least scarred by modern war, an initiator of the United Nations that we thought would distribute Western influence throughout the world. Freedom and equality for each individual, government of, by, and for the people—these American values we found good, principles by which we could live as men. Many of us began maturing in complacency.

As we grew, however, our comfort was penetrated by events too troubling to dismiss. First, the permeating and victimizing fact of human degradation, symbolized by the Southern struggle against racial bigotry, compelled most of us from silence to activism. Second, the enclosing fact of the Cold War, symbolized by the presence of the Bomb, brought awareness that we ourselves, and our friends, and millions of abstract "others" we knew more directly because of our common peril, might die at any time. . . .

While two-thirds of mankind suffers undernourishment, our own upper classes revel amidst superfluous abundance. . . . Although mankind desperately needs revolutionary leadership, America rests in national stalemate, its goals ambiguous and tradition-bound instead of informed and clear, its democratic system apathetic and manipulated rather than "of, by, and for the people." . . .

In a participatory democracy, the political life would be based in several root principles:

- that decision-making of basic social consequence be carried on by public groupings;
- that politics be seen positively, as the art of collectively creating an acceptable pattern of social relations;
- that politics has the function of bringing people out of isolation and into community, thus being a necessary, though not sufficient, means of finding meaning in personal life;
- that the political order should serve to clarify problems in a way instrumental to their solution; it should provide outlets for the expression of personal grievance and aspiration; opposing views should be organized so as to illuminate choices and facilitate the attainment of goals . . .

The economic sphere would have as its basis the principles:

- that work should involve incentives worthier than money or survival. It should be educative, not stultifying; creative, not mechanical; self-directed, not manipulated, encouraging independence;
- that the economic experience is so personally decisive that the individual must share in its full determination;
- that the economy itself is of such social importance that its major resources and means of production should be open to democratic participation and subject to democratic social regulation.

Like the political and economic ones, major social institutions—cultural, education, rehabilitative, and others—should be generally organized with the well-being and dignity of man as the essential measure of success.

In social change or interchange, we find violence to be abhorrent because it requires generally the transformation of the target, be it a human being or a community of people, into a depersonalized object of hate. It is imperative that the means of violence be abolished and the institutions—local, national, international—that encourage nonviolence as a condition of conflict be developed. . . .

As students, for a democratic society, we are committed to stimulating this kind of social movement, this kind of vision and program in campus and community across the country. If we appear to seek the unattainable, as it has been said, then let it be known that we do so to avoid the unimaginable.

Source: Students for a Democratic Society, 112 East 19th Street, New York, New York.

named national officers for 1969–1970 terms, SDS was nearing its end. There are numerous theories about the cause of SDS's decline. Some blame the interference of the government, especially the Federal Bureau of Investigation (FBI)'s Counter Intelligence Programs targeted at New Left activities (COINTERPRO—NEW LEFT), charged first with surveillance, later with infiltrating and undermining groups such as SDS, which FBI director J. Edgar Hoover deemed threats to national security. Others suggest that the organization's androcentric leadership and belated public support for the women's movement undermined its claim to inclusiveness and idealism. Others say the problem was structural, claiming that as SDS grew, a broadly participatory national movement (versus a representative democracy) simply became unwieldy. Still others argue that the escalation of the war, both at home and in Vietnam, made unity through consensus an untenably slow process for an increasingly urgent political agenda and correspondingly impatient membership.

Whatever the reasons, by 1969, SDS's aspirations to nonsectarianism gave way to factions, as the group's members split on matters of both loyalty and strategy. These ideological clashes resulted in pronounced divisions among the membership, chiefly between the Maoist, worker-identified Progressive Labor Party and the Weatherman, a revolutionary splinter group more apocalyptic in mood and alleged to have staged bank robberies, bombings, and riots in the streets.

Although SDS itself was short-lived, its influence continued long after its own organization fell. Subsequent campus radicals, from feminist and environmental activists to antiwar and anti-apartheid protesters, routinely attest to the energy and inspiration they drew from the legacy of the student movement during the 1960s, frequently acknowledging SDS as a precedent for transformative coalition-building for students who wished, together, to make a lasting difference in the world. For example, in Tony Vellela's *New Voices: Student Activism in the '80s and '90s* (1988), Josh Nessen, an anti-apartheid leader and college divestment activist, comments that

> SDS played a key catalytic role—that's what students can do. I think sometimes people are wary of national organizations, because too much of their energy goes into internal politics. At least I am. I think the history of SDS has been distorted to focus on what happened at the end, the ideological squabbles, and a lot of the positive things are lost.

Throughout its history, SDS forwarded the political message that ordinary people can and do change the course of history. That message continues to resonate among student activists.

Free Speech Movement

The Free Speech Movement (FSM) at the University of California at Berkeley during the fall 1964 semester was the first of the 1960s student movements to make headlines all over the world. Lasting a little over two months, it ended with the arrest of 773 persons for occupying the administration building, the removal of the campus administration, and a vast enlargement of student rights to use the university campus for political activity and debate. In the longer term, it contributed to the election of Ronald Reagan as governor of California in 1966 and the firing of university president Clark Kerr the following January.

Background

During the Cold War, the universitywide administration imposed numerous rules designed to keep politics out of all the university campuses. By the time Berkeley chancellor Clark Kerr became university president in 1958, student groups could not operate on campus if they engaged in any kind of off-campus politics, whether electoral, protest, or even oratorical. At the Berkeley campus students spoke, leafleted, and tabled on the city sidewalk at the campus edge. When the campus border was moved a block away, the activity moved with it. Since the sidewalk at the new boundary was too narrow for much activity, Kerr authorized the creation of a small plaza just inside the new boundary for student political groups to use. The regents of the university voted to give the plaza at Bancroft and Telegraph to the city of Berkeley, but the transfer never took place. For the next few years, student groups of all persuasions used this plaza as though it was public property when legally it was still part of the university.

In the fall of 1963 and the spring of 1964, the Bay Area was rocked with civil rights demonstrations against employers who practiced racial discrimination. Vast numbers of Berkeley students were recruited for these protests from the plaza, and they were numerous among the 500 arrests made over several months. This led to demands by some state legislators that the university discipline and control its students. In July, students were recruited to demonstrate at the Republican Convention being held in San Francisco, as well as at several businesses in Oakland. An *Oakland Tribune* reporter found out that this political activity was taking place on the campus proper; when word reached the campus administration, it decided to put a stop to it.

Origins

On September 14, 1964, Dean of Students Katherine Towle, at the behest of the vice chancellor, Alex Sherriffs, wrote a letter to the student political groups telling them that they could no longer use the plaza to solicit support for "off campus political and social action." Realizing that this would deprive them of the one good spot to reach students and raise funds, eighteen student groups from across the political spectrum asked the dean to reverse the ruling. They soon discovered that she didn't have the power to do this. Calling themselves the United Front, the student groups defied the policy by setting up their tables as before, and also in front of the administration building facing Sproul Plaza, where they had never been before.

Several students led a rally and march against the "new" regulations without getting prior permission—required by the old rules—to do so. When five tablers were ordered to go to the dean's office, some 400 students signed a petition of complicity and filled the halls of the administration building demanding that they, too, be disciplined. The dean announced that three names had been added to the "cited students" list, and all eight were "indefinitely suspended." At 3:00 A.M. the crowd left the building. The next day tables were again put up in front of the administration building. This time the campus police arrested Jack Weinberg, who was sitting behind the CORE table, after he refused to give his name or show his student

card. Weinberg was an alumnus, not a current student, and didn't have a card. He did have a long record of civil rights activity, including several arrests the spring before.

The police brought a car onto the plaza and, after he went limp, carried him to it. Students spontaneously surrounded the car to keep it from moving and deflated the tires. The police temporarily retreated while thousands of students took over Sproul Plaza. The car was held hostage for thirty-six hours. With Weinberg inside, the police car became the platform for a continual rally. Art Goldberg and his sister Jackie, both experienced student activists, were the leaders of the United Front, but from the top of the car new people emerged who captured the loyalty of the crowd. Mario Savio, a junior who had transferred from Queens, New York, the year before, was soon recognized as the most charismatic speaker.

Having no plan or strategy, the United Front made it up as they went along. Students once again occupied the administration building, clashing with police when they tried to close it early, but they left the building to spend the night around the car. Near midnight, about 100 fraternity boys surrounded the few hundred students still there to heckle and pelt them with eggs and lighted cigarettes. They finally left after a Catholic priest pleaded for peace from the top of the car.

The United Front selected a negotiation group, but the campus administration refused to meet with them. Instead, it arranged with several local police forces to arrest everyone who did not leave the plaza by 6:00 P.M. Several hundred police were brought on campus and lined up behind adjacent buildings. In the meantime, Governor Pat Brown ordered President Kerr to seek a peaceful solution with the protesters. Kerr invited them to meet with him at 5:00 P.M. in his office. After a contentious meeting, in which the students disagreed among themselves on what to do, Kerr and the United Front signed the pact of October 2. Everyone returned to the plaza, where Savio mounted the car and told the students to disperse.

The Free Speech Movement

Weinberg was booked and released, and the university did not press charges. The fate of the eight cited students was referred to a specially created faculty committee, which conducted a hearing that lasted several weeks. The United Front met and dissolved. In its place the Free Speech Movement was created. It consisted of an executive committee of about fifty or so, including the cited students, representatives of existing student groups, plus some new entities (e.g., independent students, grad students, nonstudents, and off-campus religious groups). From its members was elected a steering committee of twelve, to monitor negotiations over new rules for student groups.

The composition of the steering committee varied over the next two months. In addition to Weinberg and Savio, Bettina Aptheker and Steve Weissman played key roles. There were no officers, though an informal division of labor emerged. Savio was the chief spokesperson, Weinberg the top tactician, while Weissman chaired most of the meetings and Aptheker moderated the debates. An administrative apparatus grew up at Savio's apartment, soon called FSM Central, where meetings were planned, leaflets were drafted, and phone calls were made. Hundreds of students were energized by the conflict and on their own produced numerous documents, an FSM button, and even a recording of FSM Christmas carols. Sales of the latter two items were the primary source of funds, plus donations.

An eighteen-member Campus Committee on Political Activity (CCPA)—with equal representation from the administration, the faculty, and the students (four of whom were FSM leaders)—met for three weeks without coming to an agreement. The committee favored removal of most of the old rules, permitting students to meet on campus, put up tables, pass out literature, collect funds, and discuss issues. The sticking point was whether students could advocate illegal off-campus actions (i.e., getting arrested at civil rights demonstrations). The FSM held that the only limits on advocacy should be those of the U.S. Constitution, as interpreted by the courts, and the only punishment should be that dispensed by a judge after a criminal trial. The administration maintained its right to discipline students for conduct other than a criminal offense.

The negotiations collapsed over this issue, and the FSM resumed picketing on campus on November 4. In the interim, a moratorium of sorts had existed. The student groups did not put their tables up on campus (even in the previously permissible plaza at Bancroft and Telegraph), or leaflet or collect funds, except on the city sidewalk. The steering committee decided to end the moratorium and escalate the conflict by putting tables up on campus. This precipitated the biggest split within the ranks of the FSM. Ostensibly the final decision maker, the executive committee met about once a week. After extensive discussions lasting

for several hours, votes were taken among the few who were left. Most decisions were in fact made by the steering committee, which met every day, and at some points, Savio and Weinberg made decisions after consulting with whomever they thought it important to consult. This, plus the escalation in confrontation, cracked an existing fault line within the FSM and led to some acrimonious meetings of the Executive Committee of the Associated Students of the University of California at which the moderates lost very close votes. As a result, the conservative student groups dropped out of the FSM, and the liberal groups were sidelined. The radicals were firmly in charge.

The dispute within the FSM over whether to resume negotiations was mooted when the campus administration disbanded the CCPA and cited a few dozen more students for sitting at tables. Tabling continued but was ignored by the administration. In the meantime, the faculty committee on the eight cited students recommended that six be retroactively reinstated with only a censure on their records, and that Savio and Weinberg receive six-week suspensions. The committee criticized the administration's handling of the matter, especially the "indefinite suspensions" prior to a hearing.

Meeting on November 20, the Regents endorsed the administration's proposed revision of university rules, which would permit most political activity previously prohibited but would allow for discipline of those who used the campus to pursue unlawful off-campus action. Buried in these recommendations was a warning that further disciplinary action would be taken against organizations and students who had violated the old rules after September 30. The FSM's request to address the Regents was denied, but it was allowed to send five observers. Outside, students held a rally and debated what to do. The FSM observers who reported on the Regents' meeting were angry and urged action.

Undecided on how to respond to a partial victory, a bare majority of the FSM Steering Committee voted to occupy the administration building on Monday, November 23. At the rally, Weissman announced that those assembled would debate whether or not to sit in. After a contentious debate, about 300 students entered the administration building, where the debate continued. Three hours later, depressed and demoralized, they decided to leave; most within the FSM thought it was dying.

Student anger revived a week later when the campus administration sent letters to four key students—Savio, Art Goldberg, Jackie Goldberg, and Brian Turner—charging them with violating university regulations for leading the October 1 and 2 demonstrations. The FSM told students to bring their sleeping bags to a noon rally on Wednesday, December 2. After a spirited rally, featuring famed folksinger Joan Baez, about 2,000 people once again occupied the administration building. In the middle of the night, Governor Brown told the police to clear the building. Arrests started at 3:00 A.M. and took twelve hours.

Although the newspapers reported that 801 had been arrested, the process was so muddled that no one knew for weeks that the total was 773, including 735 students. They were collectively referred to as "the 800." A student strike began while the building was being cleared. Faculty raised bail money and drove to the various detention centers to bring the students home. Multiple meetings were held over the weekend by everyone involved—except the chancellor, who was hospitalized. President Kerr canceled classes for Monday to hold a university meeting, where his newly formed committee of department chairmen would read what Kerr hoped were acceptable terms to end the conflict. While offering amnesty for violations of the old rules during the prior two months, they did not enlarge what the Regents had agreed to two weeks earlier.

These proposals were challenged by graduate students at numerous departmental meetings held Monday morning. By the time the university meeting was held at noon, roughly one-third of the departmental chairmen no longer supported the proposals. After Professor Robert Scalapino of the Political Science Department read them, Savio walked to the podium intending to speak. Several campus police officers emerged from behind a curtain and dragged him off the stage before he could do so. The audience of about 15,000 erupted in dismay. Some rushed to the stage, where they were tackled by the police.

When the dust settled, Savio was permitted to speak, but he just invited everyone to a rally at the administration building. There, most of the speakers were faculty, along with a few public officials who agreed with the students that political activity should be allowed on campus. The next day the largest Academic Senate meeting in anyone's memory voted overwhelmingly for no restrictions on the content of speech or advocacy—which was the FSM's position. When the faculty left the hall, students cried, cheered, and applauded.

AFTERMATH

Symbolically, the FSM had won, but the struggle was not over; only the Regents could set policy. When they met on December 18, they voted to support the First and Fourteenth Amendments to the U.S. Constitution but insisted on law and order. The faculty felt the spirit of their resolution had been met, but the FSM did not. When the new campus administration wrote detailed regulations, the content of advocacy was ignored in favor of stringent time, place, and manner rules. Scuffling over the rules and how they were applied continued for some time.

In the spring, Art Goldberg and eight others (but only three students) were arrested for displaying and saying the word "fuck" on Bancroft Plaza. The incident was precipitated by a young man just arrived from New York who was arrested for holding up a piece of paper with that word on it while on campus. Three rather small support rallies were held, but apart from these few arrests, little action came from either students or faculty. However, some Regents were outraged and told President Kerr to expel the students. Instead, he and the new acting chancellor offered their resignations. Their resignations were withdrawn at an acrimonious Regents' meeting three days later, but the press had a field day. The student newspaper editorialized that "there is absolutely no need for a Filthy Speech Movement." That phrase was

copied all over the country. The FSM, which had voted to stay out of this conflict, was permanently stuck with the label.

The nine were convicted in municipal court and sentenced without incident. The FSM objected only when the campus administration appointed a disciplinary committee, which, the FSM charged, was double jeopardy. Since there was no support from students or faculty, only verbal protests were made when that committee recommended that Art Goldberg be expelled and three other students (two of whom had also been arrested) be suspended. However, the incident convinced the Regents, the legislature, and the public at large that the Berkeley students were irresponsible and needed more discipline, not more freedom. The "800" were tried in the spring before a judge and convicted on two of three counts. Most got probation or fines; FSM leaders were sentenced to 30 to 120 days. After two years, the final appeal was denied and the "800" paid their fines and served their time. The FSM dissolved. Its place was taken by new campus groups, especially the Vietnam Day Committee, which organized one of the first campus teach-ins in May of 1965. Protest against the war largely replaced civil rights demonstrations, though some new issues also emerged.

The FSM was the beginning of what came to be called the "six-year war" on the Berkeley campus. Although student groups could now meet, set up tables, distribute literature, raise money, and pretty much say what they pleased at rallies and demonstrations on campus, skirmishes continued over time, place, and manner rules, as well as what nonstudents, including dropouts and alumni, could do on the campus proper. Three decades later, a multimillion-dollar grant from an alumnus paid for a student cafeteria that memorialized the FSM and for putting the FSM archives on line. The steps of the administration building were officially named the "Mario Savio" steps, and an adjacent campus was called the Clark Kerr campus of the University of California.

Vietnam Antiwar Campus Activism

From the first nationally publicized student anti–Vietnam War protest in 1965 to the street battles between student protesters and police on the streets of Chicago in 1968 and 1969, to the Kent State massacre, to the waves of large-scale campus protests in the early 1970s, student antiwar protests galvanized the nation and forced it to confront the meaning of the Vietnam War. Although the anti–Vietnam War movement was much wider than the university community, young Americans outnumbered other groups in most protests and the media quickly identified university students as the rank and file of the antiwar movement. Regardless of the validity of this image, university communities made up a very important segment of the anti–Vietnam War movement, contributing valuable intellectual and financial resources to the movement, as well as a large portion of the energy involved in organizing such a large and dynamic movement.

Vietnam and the National Antiwar Movement

Developments within the campus antiwar movement directly responded to the U.S. government's operations in Vietnam and the actions of the off-campus antiwar movement. The conflict in Vietnam had begun as a Vietnamese nationalist struggle against French imperialism following World War II. In the 1950s, when the French began losing to Vietnamese forces led by Communist Nationalist Ho Chi Minh, the U.S. sent military and financial aid to the French to prevent the country from falling to the Communists. In 1954, the French were decisively defeated at Dien Bien Phu and were ousted from the country. After the war, the 1954 Geneva Accords recommended that the country hold national elections. But the United States supported the unpopular anti-Communist regime of Ngo Dinh Diem in the south, who prevented the elections from taking place. Communists and Nationalists in the north and south fought to unite the country under one popular and independent government and to evict the United States. Direct U.S. involvement in Vietnam remained minimal in the early years, and so too did antiwar activism. Pacifist groups, such as the Fellowship of Reconciliation, War Resisters League, and Women's Strike for Peace, strongly opposed U.S. involvement in Vietnam from the start, but the issue was subsumed by their effort to end the nuclear arms race.

As Communist and Nationalist forces grew in Vietnam, the United States committed more advisers and money to the conflict. Finally, with the passage of the Tonkin Gulf Resolution in 1964, the Johnson administration began extensive bombing in North Vietnam and soon afterward sent in American ground troops. The number of American troops in Vietnam gradually increased until it peaked at over 540,000 in 1969. As the war escalated, pacifist organizations increasingly focused their efforts on raising awareness of the costs of the war and in voicing protests. Between 1965 and 1968, a large number of antiwar organizations emerged throughout the country. Some were religious groups protesting the immorality of the war, others were groups of citizens with a variety of concerns, and others formed specifically to oppose the Selective Service System. Activists from forty organizations formed the National Coordinating Committee to End the War in Vietnam (CEWV) in 1965. In October they joined an estimated 100,000 activists on campuses and in eighty cities for the International Days of Protest, an international protest against American involvement in Vietnam. A coalition of more than seventy-five anti-draft groups formed the Resistance in 1965 to undermine the Selective Service through open noncooperation with the draft. Members of the Resistance and other draft resisters picketed induction centers, burned their draft cards,

formed support groups to educate and assist those threatened with being drafted, and protested the draft in other ways throughout the late 1960s. Existing multi-issue organizations, such as the Southern Christian Leadership Conference and Student Nonviolent Coordinating Committee for civil rights, also included opposition to the Vietnam War on their agendas.

As the war progressed, antiwar organizations proliferated. Famous pacifists A.J. Muste and Dave Dellinger formed the Spring Mobilization Committee to End the War in Vietnam (MOBE) to appeal to people of all political persuasions and ages to unite in a loose coalition around the single issue of the war. Spring MOBE sponsored two simultaneous rallies in April 1967, attracting 50,000 in San Francisco and over 200,000 in New York. Dellinger next converted the ad hoc Spring MOBE into a permanent organization and sponsored a demonstration in Washington, D.C. This event attracted over 100,000, including countercultural Yippies, who attempted to levitate the Pentagon. These national demonstrations and the explosive growth of national antiwar organizations attracted the attention of many previously uninterested students who began to question American policies in Vietnam.

Although most Americans initially supported U.S. involvement in Vietnam to prevent the spread of Communism, this Cold War rationale failed to convince a significant proportion of Americans. Roughly 25 percent of Americans over thirty and 14 percent of twenty-year-olds thought that American intervention in Vietnam was a mistake in 1965, and by mid-1967, these numbers had grown to 38 percent and 31 percent, respectively. Students were only slightly more opposed to the war than other young people. As late as 1967, only 35 percent of students wanted to reduce U.S. military involvement in Vietnam, while 49 percent favored escalation. Although fewer young people and students opposed the war than supported it, those who did oppose the war more often expressed their dissent with direct action and consequently received more public attention.

The crucial event in swaying U.S. opinion against the Johnson administration's Vietnam policy was the Tet Offensive. On January 30, 1968, North Vietnamese and Vietcong forces launched an enormous offensive on nearly every South Vietnamese and American military base and hundreds of towns and major cities in South Vietnam. This attack more than any other single event convinced Americans that Lyndon Johnson's policies in Vietnam had failed and that he and his advisers had misled them. Whereas 60 percent of Americans supported U.S. intervention in Vietnam before Tet, a month later doves led hawks 42 to 41 percent. In the face of massive antiwar protests and this perceived defeat, President Johnson announced that he would seek immediate negotiations for peace in Vietnam and would not run for a second term of office in the 1968 elections.

A divided nation elected Richard M. Nixon—who promised "peace with honor"—as president in 1968. The next year there was no peace, and so over 1 million liberal antiwar activists, organized by the Vietnam Moratorium Committee, joined in two national antiwar actions to cease business-as-usual in America and express support for U.S. withdrawal from Vietnam. Called the Moratorium, this action included several members of Congress and senators in its peaceful antiwar marches and other activities. By the early 1970s, a majority of Americans favored U.S. withdrawal from Vietnam, and many advocated a revision of draft laws. The antiwar movement blossomed with the addition of businessmen, clergy, teachers, and members of Congress to its ranks.

Responding to pressure from Congress and the public, Nixon continued his "Vietnamization" policy, withdrawing U.S. soldiers and providing the South Vietnamese Army with training and weapons to fight the war on its own. Nixon, however, escalated bombing in Cambodia and North Vietnam to force the North Vietnamese to negotiate a treaty favorable to the Saigon government. This tactic enraged many antiwar activists who responded with massive protests. National antiwar organizations, such as the National Peace Action Coalition and People's Coalition for Peace and Justice, coordinated some of the largest antiwar marches in U.S. history in 1971 and 1972. They led an antiwar March on Washington in April 1971, which attracted nearly 500,000 in Washington, D.C., and another 150,000 at a simultaneous demonstration in San Francisco. They next attempted to protest the war by shutting down the federal government in Washington, D.C., on May 1, 1971. Fewer activists participated in this May Day protest, but the police and National Guard arrested 2,000 demonstrators who attempted to sit down at street intersections. After this last peak in antiwar activism, the movement quickly lost momentum. As the last U.S. combat troops left Vietnam in 1973 and the American-sponsored government in Saigon fell in 1975, the antiwar movement disappeared.

A Slow Beginning 1950–1964

Similar to the off-campus pacifist movement, the university peace movement remained relatively small

through the 1950s and early 1960s. In the midst of the Cold War standoff between the United States and the USSR, peace protesters were often labeled as Communists and traitors. In this anti-Communist atmosphere, it was very difficult for pacifists to make a stand and be taken seriously by their communities. The threat of nuclear holocaust and the encouragement of adult pacifist groups, however, spurred a small minority of students to speak out against America's foreign policies. By the 1950s, the Student Peace Union, the Fellowship of Reconciliation, and the National Committee for a Sane Nuclear Policy (SANE) had established small student groups on campuses throughout the United States. These pacifist groups held educational meetings, rallies, silent vigils, and letter-writing campaigns to broadcast what they saw as the futility and danger of nuclear weapons, and to pressure the government to take steps toward nuclear disarmament. Like the wider public, however, the student pacifists knew very little about the Vietnam conflict at this point, and the war there seemed unimportant in comparison to the threat of nuclear holocaust.

By the early 1960s, however, newspaper headlines were making students more aware of the Vietnam War, and student pacifists began speaking out against it as well as nuclear weapons. For example, in the autumn semester of 1963, students at Harvard, Princeton, the University of Michigan, and the University of Chicago protested when Madame Ngo Dinh Nhu, sister-in-law of Diem, spoke at their campuses, attempting to raise U.S. support for her relative's failing regime. A number of universities also witnessed sporadic protests the next year in response to the first U.S. air raids on North Vietnam following the Tonkin Gulf Resolution. These protests, however, were largely uncoordinated and unpublicized, so they made little direct impact on either the campus community or wider society.

One of the few national student organizations to devote extensive research to the Vietnam conflict before 1965 was Students for a Democratic Society (SDS). SDS emerged in 1960 as a liberal multi-issue organization, seeking to address a variety of social ills such as racism, economic inequality, and violence, using participatory democracy as its model of social organization. It had very little influence outside of the University of Michigan in the early years but had expanded to a handful of other large midwestern and northern campuses by 1964. Although SDS focused primarily on civil rights and poverty in the early 1960s, it created a Peace Research and Education Project (PREP) in the autumn of 1962 to stimulate discussion and research on peace, disarmament, the military draft, American imperialism, and foreign policy. Relying heavily on older pacifist organizations such as the Fellowship of Reconciliation and the War Resister League's *Liberation* magazine, PREP thoroughly investigated the history of the Vietnam conflict and quickly built a strong case against U.S. involvement in Vietnam. What little resources PREP had, however, were devoted primarily to protesting nuclear weapons. Campus activism against the Vietnam War, therefore, was minimal through 1964, but the peace organizations formed in this period proved crucial to founding a strong student antiwar movement in the years that followed.

THE MOVEMENT FORMS 1965–1967

A true student-based antiwar movement formed in the years following 1965 in response to the commitment of combat troops to Vietnam, escalating draft calls, eroding draft deferments for university students, and off-campus antiwar protests. Concerned and threatened by the escalating war and draft calls, students investigated the war's origins and found many disturbing aspects of U.S. intervention there. These students joined national antiwar organizations and founded their own local committees to protest the war. Student activism on these issues usually met with strong resistance and criticism from authorities and fellow students. This in turn further radicalized activists. In the 1964–1965 academic year, roughly 12 percent of American campuses witnessed some form of antiwar activism. By the 1967–1968 academic year, that number had increased to over 35 percent. The average proportion of students involved in these protests, however, remained at about 5 percent throughout the period. Thus, while the campus antiwar movement was spreading rapidly across the country, it still was attracting the support of only a small proportion of the student population.

Through this period at least, SDS remained the leading national student antiwar organization, due largely to its well-planned and well-publicized national protest, which took place in Washington, D.C., in April 1965. SDS's PREP had been planning the demonstration since the autumn semester. Just prior to this demonstration, however, the Johnson administration announced its decision to commit combat troops to Vietnam. This action outraged many liberal students who had hoped that Johnson would withdraw from Vietnam. The timing of the SDS demonstration contributed to a high turnout of 20,000, much

more than SDS had anticipated. Because of this high turnout, the demonstration also received extensive media coverage. The press presented SDS as a new radical leader of the antiwar movement, despite the SDS leaders' emphasis on the multi-issue nature of their organization. As a result of this new media image, students around the nation wrote to the SDS, requesting more information about the war and membership in the organization. SDS's membership grew from 1,000 paid members in June 1964 to an estimated 100,000 members in 350 chapters in 1968. The small SDS national leadership was completely overwhelmed with its new popularity and could not spare the time to fulfill all the requests for literature and information. Many SDS chapters were consequently formed by people who had very little contact with the national SDS and neither knew nor cared about SDS's theoretical interpretation of the issues.

Between 1965 and 1967, SDS gradually turned away from its antipoverty program toward ending the war in Vietnam. Seeing the war as the most dangerous and immediate evil, SDS organized students all over the country to pressure President Johnson to withdraw from Vietnam. Local antiwar organizers formed SDS chapters at campuses across the nation. SDS also encouraged other liberal student organizations to take up the fight against the war. A primary target in the 1965–1966 academic year was the National Student Association (NSA), an umbrella organization of representatives from the student governments of universities across the country and the self-proclaimed voice of American students. Working through the Liberal Caucus of the NSA, the SDS convinced many NSA delegates that the Vietnam War and the draft directly conflicted with student interests. The NSA consequently sponsored a forum on the war in 1965, which introduced the antiwar stance to many students on more conservative campuses. The next year, the NSA advocated the abolition of the Selective Service System, expressing its opposition to "any system of forced service to the government" and the government compelling "its citizens to kill." It suggested that the government at least revise draft laws to eliminate racial and socioeconomic inequalities.

The 1964–1965 escalation of U.S. involvement in Vietnam spurred the entire community at many campuses to learn more about the war that spring semester. Faculty, staff, students, and the public joined in informal conferences, called "teach-ins," to discuss the origins of the war, share their concerns, and discuss alternative foreign policies. University of Michigan faculty sponsored the first nationally publicized teach-in as an educational protest against the war in Vietnam in the spring of 1965. The teach-in involved 3,000 students who listened to arguments for and against the war. University of Michigan students and faculty then formed an Inter-University Committee for a Public Hearing on Vietnam to organize a national teach-in on Vietnam on May 15, 1965. This national teach-in included leading authorities on Southeast Asian affairs and carried detailed information to students across the country through a television broadcast. To counteract accusations that teach-ins were unpatriotic or radical, the organizers of the teach-ins stressed the importance of free policy debate in a democracy.

The teach-in movement spread rapidly to universities all over the country. In the spring of 1965 alone, teach-ins took place at 120 universities. The largest teach-in took place at the University of California at Berkeley, where 12,000 people participated in a marathon thirty-six-hour event sponsored by the Vietnam Day Committee. Interested faculty members typically sponsored the teach-ins and presented both sides of the issue while favoring a moderate antiwar position. The teach-ins were crucial in sparking more antiwar activity because they provided student activists with detailed information in an exciting atmosphere, showed them inaccuracies in government and media reports, and emboldened them to criticize the government.

As a result of the SDS demonstration, the teach-in movement, the NSA Forum, and the success of the National Coordinating Committee to End the War in Vietnam, local Committees to End the War in Vietnam (CEWV) sprouted up at universities across the nation in 1965 and 1966. CEWV groups were usually coalition organizations, which united SPU, SDS, and Resistance activists and other students around the single issue of opposing the war. As coalition groups, CEWV chapters were often more moderate in their tactics and rhetoric than the SDS. Another major student-led antiwar organization formed that spring was the Vietnam Day Committee (VDC), which originated at UC Berkeley in 1965. That year the Berkeley VDC sponsored three major antiwar marches attracting between 6,000 and 15,000 students. Students at campuses elsewhere later formed VDC groups to sponsor teach-ins and protests. Another tactic advocated by SDS and VDC was draft resistance in the form of burning or turning in draft cards. This strategy openly and publicly confronted the Selective Service System and the Johnson administration's commitment to sending American troops to Vietnam, hoping to undermine

the government's authority and ability to wage the war, as well as draw public attention to the moral issues involved in the draft and the war. In addition to educational forums on the war and the draft, and draft-card turn-ins, these groups imitated the tactics of the civil rights movement. Using pickets and sit-ins, they frequently broke campus regulations and defied police orders to protest military and weapons manufacturer recruiters and the Reserve Officer Training Corps on campus. Those protesters who used these forms of civil disobedience were quickly arrested and punished, usually with a warning or, in extreme cases, expulsion from the university. The government dealt with illegal draft-card turn-ins and burnings in a variety of ways. Many draft resisters were arrested and imprisoned or lost their draft deferment status. the Johnson administration was reluctant to make martyrs of the resisters and draw further attention to the war opposition, so most draft resisters were simply monitored by the FBI or ignored.

Antiwar activists also encountered much apathy and downright opposition from fellow students. Especially in the early and mid-1960s, they often alienated their friends and family with their pacifist beliefs, were called "Commies" and cowards, and occasionally faced violent opposition from other students, authorities, and the wider public. Sensationalist news coverage of the student protests contributed to a public backlash against the campus antiwar movement. Reporters were all too eager to focus attention on extremists in the movement and emphasize any negative aspects of the movement. Government officials were also intent upon making certain that the campus antiwar movement remained isolated. In March 1965, FBI director J. Edgar Hoover testified before the House Appropriations Committee that Communists had orchestrated the antiwar protests, despite the lack of any evidence to substantiate this claim. In this way, Hoover knowingly misled Congress and mislabeled the antiwar movement as Communist. Operating within the context of Cold War politics, members of Congress were quick to believe Hoover's assertions and eager to destroy all manifestations of Communism in America. That April the FBI began large-scale interviewing of SDS members to intimidate them and undermine their antiwar activism. Portrayed as Communist dupes and spoiled young rich kids who used outrageous antics to rebel against their parents, student activists found it difficult to gain respect and to influence the wider public.

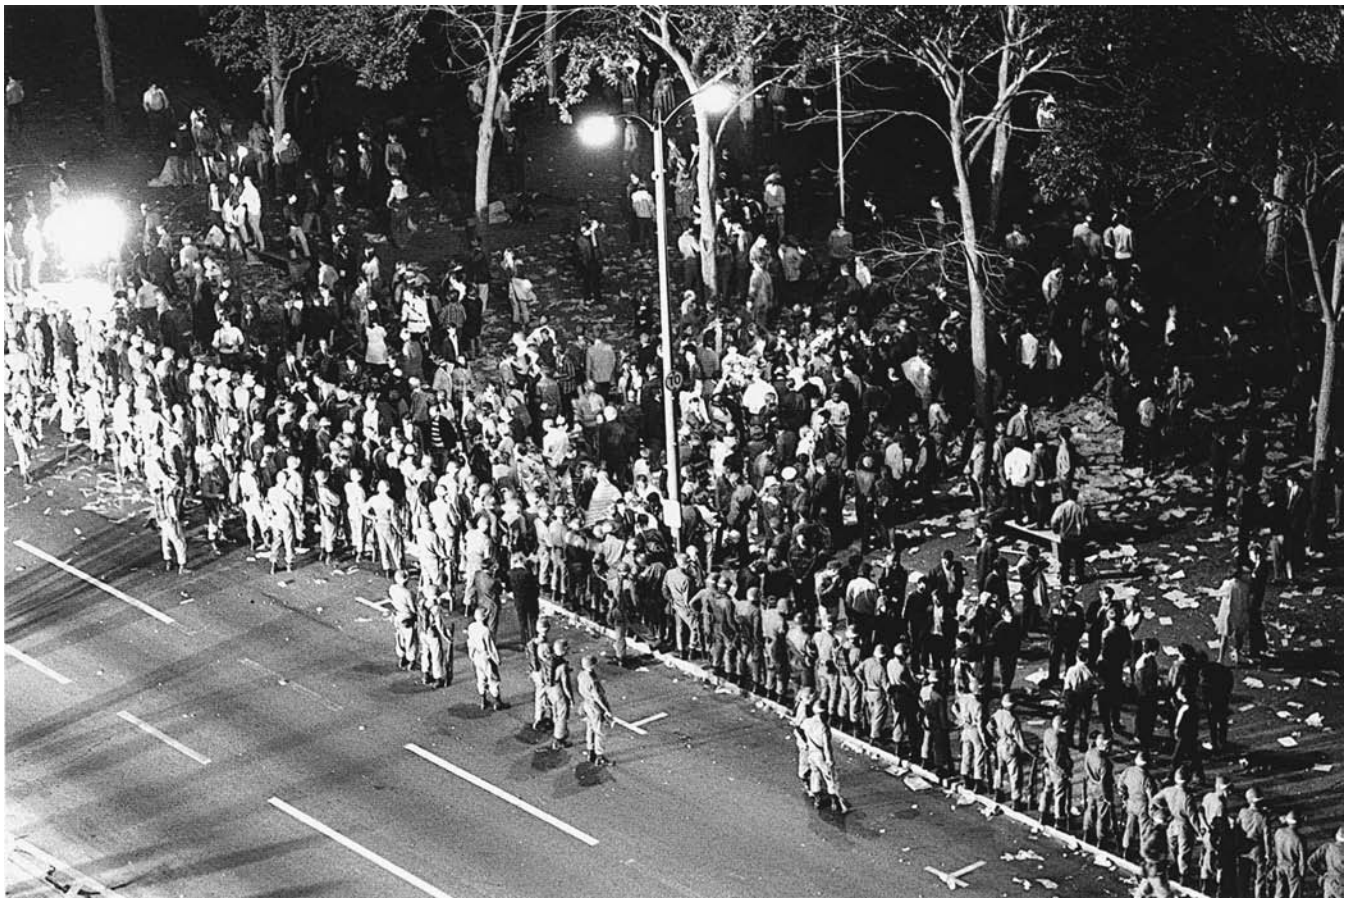
The Tide Turns 1968–1969

Despite the best efforts of government agencies to discredit the student antiwar movement, it continued to grow and dominate campuses in the late 1960s. As public opinion turned against the war following the Tet Offensive, the number of campus protests against U.S. policies in Vietnam increased. Students continued to be divided over the war, but by 1969 the number of those identifying themselves as "doves" had grown to 69 percent. Doves pressed for a gradual or immediate withdrawal from Vietnam and waited to see if Nixon would keep his campaign promise of "Peace with Honor." An estimated 1 million students, faculty, and teachers participated in a Student Mobilization Committee international strike against the war in April 1968. The National Moratorium on the war also attracted widespread support from the campus movement. Thirty-two percent of the nation's campuses observed the October Moratorium, 22 percent observed the November Moratorium, and 5 percent the December Moratorium. Nationwide, 19 percent of undergraduates participated in a demonstration against U.S. military policy at their colleges in 1969.

Chicago 1968

One of the most shocking and unforgettable protests of the 1960s was the antiwar demonstration at the Democratic National Convention in Chicago in August of 1968. Although people of all backgrounds joined in the protests, the press interpreted it as a student-led and organized event. Some activists were determined to use the convention as a stage to publicize their dissent from establishment politics and the Vietnam War. Speakers from MOBE, SDS, and other dissent groups traveled the country, urging students to go to Chicago to confront the "Establishment" with their dissent. They hoped to bring hundreds of thousands to the demonstration to show the world their opposition to the war. The antiwar movement, however, was divided over the effectiveness of this type of action. The more moderate antiwar leaders even warned their constituents to stay away from Chicago.

Although only 10,000 participants turned out for the Chicago demonstration, they and the Chicago police made an enormous impact on the student movement and public perception of protest activism. Chicago mayor Richard Daley and the FBI had prepared well in advance to prevent demonstrators from disrupting the convention. The FBI, which had long worked to undermine the peace movement, confused



National Guardsmen confront antiwar protesters in Chicago during the Democratic National Convention on August 28, 1968. A police riot during the convention led to numerous injuries. *(AP Wide World Photos)*

and misled antiwar organizations by posing as antiwar supporters. Daley did his part by denying protesters permission to rent public facilities, hold rallies, or conduct marches. He used 12,000 Chicago police officers and 6,000 Illinois National Guardsmen to ensure that the demonstrations would not take place. When activists stayed in the parks past a curfew, Daley's police forcefully evicted them. When they attempted to hold rallies or marches, Daley's police dispersed them. For three days activists protested, and for three days the Chicago police beat, maced, and arrested them. In some cases, the police attacked bystanders, residents, and news reporters. As the Walker Report on the protests concluded, the events in Chicago amounted to a "police riot." The major television networks broadcast much of the action to the nation. Most adults supported the police and condemned the violence of the young antiwar protesters. Most student activists, however, sympathized with the young victims of police brutality and saw this as another example of official repression and harassment.

Radicalization of the SDS and Other Campus Antiwar Organizations

The Chicago riots were the beginning of the end for the SDS. SDS leaders knew that the FBI had targeted them. Because of SDS's open membership and democratic structure, FBI operatives had easy access to the highest levels of decision making within the organization. FBI harassment at the Chicago demonstrations put tremendous pressure on the SDS to combat infiltration and violence by law enforcement officers. By 1969, many SDS leaders had succumbed to paranoia, refusing to openly discuss antiwar plans and suspecting everyone of spying for the FBI. In this atmosphere, the tactics of the Old Left, with its secret memberships and underground activities, made more sense than participatory democracy and nonviolence. As a con-

sequence of the escalating violence in protests, many leaders of the SDS and the New Left sincerely believed that America stood at the brink of an impending revolution, and they sought the best way to support and facilitate the revolution. In their search for new ways of understanding the war and their place in the coming social revolution, many turned to the non-Stalinist Marxism of Mao Tse-tung and Leon Trotsky. Instead of viewing racism and the war as flaws within a fundamentally good democratic system, SDS leadership now viewed their entire society as corrupted by American capitalism and imperialism. They increasingly advocated fighting for revolutionary socialism using any means necessary.

After 1968, however, SDS was seriously divided over the interpretation of the war, tactics, and other issues. Two major factions within the SDS leadership were Weatherman, which advocated terrorism to spark a student-led revolution, and the Revolutionary Youth Movement (RYM), which sought to achieve solidarity with the working class in order to end the war and bring about revolution. The divisions within SDS manifested themselves in all of their actions in the late 1960s. On the first anniversary of the Democratic Convention, SDS sponsored a national action to support the Vietnamese people and protest U.S. imperialism. Calling this action the "Days of Rage," the Weatherman faction intended to bring the war home to white middle-class America, to provoke confrontations with the "Pig" establishment of capitalists and policemen, and to attack traditional symbols of the American establishment. Weatherman leaders wanted to use the Chicago action to build a "red army to fight on the side of the Vietnamese, the blacks and oppressed everywhere" and to raise the "level of struggle" by showing that "whites are willing to fight." RYM leaders, on the other hand, formed a coalition with the Black Panthers and the Young Lords, a militant Puerto Rican group in Chicago, to sponsor a peaceful, disciplined march to link the war to the struggles of exploited and oppressed peoples in the United States.

Although the protest received much publicity, only about 600 activists actually participated. Contrary to the peaceful intentions of the RYM coalition, a small group of violent dissidents, loosely associated with Weatherman, stole the limelight. They began the week by dynamiting Chicago's monument to police officers. A group of 250 Weathermen attacked symbols of the corporate establishment, smashing the windows of several financial offices in downtown Chicago, as the police chased them down the street and "dispersed" them. RYM and their coalition held more subdued actions, which consisted primarily of legal marches and rallies with speakers from trade unions and the Black Panthers. The media, however, focused on the more extreme instances of protest and largely ignored the peaceful actions of the RYM coalition. Consequently, most of America saw the action as yet another instance of irrational lawlessness among student antiwar activists.

Weatherman violence escalated over the next several years. In December of 1969, Weatherman held a "national war council" to form revolutionary collectives of three or four members, gave up their student careers, and went underground to use symbolic violence to provoke a Socialist revolution. Weatherman collectives learned how to build bombs and use weapons to carry out the revolution. In an attempt to terrorize the government and society into ending its "imperialistic" practices, they set off hundreds of bombs in Selective Service offices, government facilities, and military research establishments across the country. Ultimately Weatherman only succeeded in making a strong negative impression on the media, public, authorities, and other students. Although SDS's antiwar stance had attracted thousands of new members in the mid-1960s, after 1969 their popularity on campuses tumbled. Polls conducted at several universities reveal that the majority of students condemned SDS tactics. The ideological divisions, explicit socialism, and negative publicity from Weatherman alienated many local chapters, who drifted away from the national office and sometimes changed their names to reflect their distance from the negative image of SDS.

Though never as radical as SDS, the National Student Association also reflected the leftward trend in the late 1960s, moving from an essentially liberal organization to an explicitly left-wing activist group. This change occurred as a result not only of the disillusionment following the Chicago convention and the escalation of antiwar protests, but because of strong pressure from the NSA's Student Left Caucus. This caucus included students from SDS, the Progressive Labor Party, the Young Socialist Alliance, and independent leftists. They felt that in order to make any progress on their aims, the student movement had to unite to fight for the end of the war and repression at home. Radical students envisioned a radical NSA as the leader of a movement to end militarism abroad and the manipulative repressive system at home, including the draft, drug laws, and paternalistic university regulations. After 1968, the NSA reflected this new vision, opposing the war in Vietnam and the

draft, and supporting student power, black power, and women's rights. In the late 1960s and early 1970s, the NSA became an important part of the campus antiwar movement, providing valuable resources, educational programs, and national coordination of antiwar efforts.

The radicalization of SDS and NSA was reflected to some extent at the local level. Although a significant proportion of the student population remained pro-war, NSA and SDS pressure led many student governments to take a stand against the war in this period. A variety of student organizations, including the SDS, CEWV, VDC, the Resistance, Young Socialist Alliance, and local antiwar committees flourished on campuses across the country, spreading the antiwar message and mobilizing support for national antiwar protests. Influenced by the Chicago "police riots," these student organizations were increasingly prepared for police violence in their demonstrations, and, while most organizations remained nonviolent, many activists were willing to use violence in self-defense. They spoke out against the repression they felt and increasingly connected official resistance to popular theories of imperialism and revolution. But most activists had little time or inclination to fully investigate Marxist interpretations of the war and society. The demands and rhetoric of campus antiwar organizations remained focused simply on forcing the American government to withdraw from an unjust and immoral war.

Although the antiwar movement on campuses spread and attracted ever more support among students in the late 1960s, authorities on and off campus were in no mood to sympathize with their demands or protests. Student antiwar activists faced hostility not only from these figures, but also from the wider public, which continued to label all student activists as spoiled, cowardly, crazy, and Communist. Despite some of the largest protests to date and widespread participation in the campus antiwar movement, it had little support from older Americans, on campus or off.

The Movement Explodes and Fizzles 1970–1975

The early 1970s witnessed not only the peak years of the antiwar movement on campuses, but also the decline and end of the movement. The peaks came suddenly in the spring of 1970 and 1972 in response to renewed U.S. attacks on North Vietnam and Cambodia, but the end came gradually between 1973 and 1975 as the United States withdrew all of its combat troops, and the Saigon government finally fell to the Communists. The 1970s, therefore, were a sort of a paradox for the antiwar movement on campuses. The movement was the strongest on campuses in 1970 and 1972, but also the weakest in the years that followed. This pattern, however, seems logical considering the course of U.S. involvement in these years. When the Nixon administration appeared to undermine the goals of the antiwar activists and officials met them with violence, students in the antiwar movement protested all the more. When the Nixon administration moved toward peace and draft calls declined, activism correspondingly declined.

At the dawn of the new decade, student antiwar activists had cause for hope that Nixon would end the war in Vietnam. He had cut draft calls and withdrawn several thousand soldiers, and Congress had taken steps to eliminate discrimination in the Selective Service. Antiwar groups still existed on campus and they continued to pressure for complete withdrawal from Vietnam, but after the success of the Moratorium and Mobilization in the fall of 1969, many thought that the war was certain to end soon. These hopes were shattered on April 30, 1970, when Nixon announced that U.S. troops and the South Vietnamese Army had crossed into Cambodia to destroy North Vietnamese supply bases in order to speed the pace of Vietnamization. Students, viewing this as a betrayal of Nixon's promise that he would not enlarge the war, demonstrated their anger with massive protests across the country. In the first week of May, an average of twenty new student strikes began each day.

Kent State

Like students at 16 percent of the nation's campuses, activists at Kent State University in Ohio held several rallies to protest the expansion of the war. These rallies led the governor of Ohio to declare a state of emergency and deploy the National Guard to enforce curfews and break up demonstrations. Confused about the presence and authority of the guardsmen and the governor's right to impose these restrictions on their freedom of lawful assembly and speech, even pro-war students grew increasingly resentful of the presence of the National Guard on their campus. On Monday, May 4, the campus was crowded with students attending classes or waiting for classes. About 100 antiwar and anti-guardsmen students were protesting the presence of the guards. Suddenly, without warning or an order to shoot, twenty-eight guardsmen shot through a crowd of students, killing four and injuring nine, many of whom stood over 100 yards away from the guards and were completely uninvolved in the confrontation.

Most students perceived the Kent State "massacre" as an extreme example of official repression of the antiwar movement, and this incident added fuel to the fires of rage on the nation's campuses. An estimated 4.35 million students at 1,300 universities and colleges, or 44 percent of the nation's total, protested the war in Southeast Asia and the murder of their fellow students, closing many universities in the process. A pattern of escalation similar to that at Kent State occurred at numerous state universities across the nation that May: students protested Cambodia and Kent State; administrators sent in campus police to arrest and disperse protesters; students protested the presence of police; and state officials sent in National Guardsmen to protect the campuses.

All of this discontent, however, was not directed simply against the war or even the Kent State killings. The demonstrations of May 1970 reveal an incredible mixture of issues. The newly politicized National Student Association responded to this outrage against their constituents by declaring a nationwide university strike and joining with antiwar organizations in a national demonstration in Washington. They aimed not only to mobilize public opinion against the expansion of the Vietnam War, but also to end all political repression against white and black radicals, as well as university complicity with "agencies of death and repression." Over 100,000 people attended the rally, where speakers revealed the extent to which activists now linked the issues of war, racism, and repression. Elsewhere, campus strikes and protests linked the antiwar cause to racism, sexism, student rights, and economic inequality. The 1970 student strikes may have begun as antiwar protests, but they ended as massive multi-issue campaigns to reform their universities and American society.

Campus protest continued at a fever pitch through 1972. In the 1970–1971 academic year, 45 percent of American colleges experienced significant demonstrations. In 1971–1972, 350 universities expe-

rienced disturbances over the mining and bombing of North Vietnam. Nixon's second inaugural attracted 200,000 protesters, and the 1972 Republican National Convention witnessed more protesters, more disruptions, and more arrests than the 1968 Democratic Convention. Some universities experienced their largest antiwar demonstrations in the spring of 1972 in reaction to the renewed bombing of North Vietnam. At the University of Minnesota, for example, antiwar activism exploded that spring. Between April 18 and May 9, protests occurred at the rate of two per week on the Minnesota campus, many of them involving 500 to 800 students. When Nixon announced further escalation of the bombing campaign, students responded with a dramatic escalation in their protests. Thousands of students faced off against riot police and the National Guard, and hundreds of students were beaten, maced, and arrested. The riots finally ended after an anticlimactic but peaceful march of 10,000 from the university to the state capitol on May 13.

Although the antiwar movement continued to attract large numbers of participants in protests through 1972, activism dropped off dramatically after 1973. As the last American combat troops were removed from Vietnam, the antiwar movement on campus lost much of its steam. A number of local campus peace groups continued to operate through 1975, but these groups sponsored more moderate activities than they did earlier in the 1970s. They raised money for the South Vietnamese and addressed the issue of amnesty for draft evaders and protesters. The main student organization for this issue was the National Campus Alliance for Amnesty, which joined with Americans for Amnesty, Fellowship of Reconciliation, Inter-Religious Task Force on Amnesty, and the American Civil Liberties Union Foundation Project on Amnesty. The amnesty movement received support from the NSA and student governments across the country. Students did not simply forget about the war as it ended. They continued to express concerns over its Vietnamese and American victims, and to learn important lessons from it.

The Authorities Respond

Another reason for the decline of the student antiwar movement was the reaction of university, state, and national authorities. Many university faculty and administrators came out strongly against the war in Southeast Asia in the early 1970s. Finally responding to student requests that the university play the role of problem-solver and social critic, many university committees formed in the early 1970s to investigate making the university work for political, educational, and social reform. At some institutions, these committees created peace studies programs, and at many institutions, they created Third World studies programs, which included Vietnam and the war. Through public statements and committee actions, many more university authorities supported the campus antiwar movement than ever before. These victories at the university level convinced many activists that they no longer needed to hold protests on campus.

State and national authorities also addressed the issue of student antiwar protests in the early 1970s, but their negative reactions made it more difficult for students to remain active in the antiwar movement after 1970. One of the strongest efforts to combat student dissent was the FBI's "New Left COINTELPRO" program, which began in October 1968 and lasted until April 1971. COINTELPRO was created in 1956 to investigate the Communist Party in America, but it soon branched out to include a number of dissident groups, including Black Power groups and the Ku Klux Klan. By 1969, the FBI had forty-two of its fifty-nine field offices and thousands of special agents actively engaged in operations against the New Left.

The FBI targeted SDS and other student groups in its attempt to neutralize and destroy the New Left from the inside. It cultivated the paranoia, distrust, and divisions that already existed within the movement by harassing student activists with repeated interviews, using a "snitch-jacket" technique of falsely labeling student activists as informants so that other students would suspect and turn against them, sending anonymous letters to black and white student leaders to turn them against each other, sending information on students' political activities to prospective employers in order to blacklist the activists, and impersonating students and alumni in letters to administrators and boards of regents to pressure them into resisting activists' demands for reform. Some FBI informants, against regulations, even led student demonstrations, provoked violence between police and students, and were arrested. These operations abused the civil rights of many activists and broke FBI and government regulations, but they caused serious problems for the campus antiwar movement, exacerbating divisions within the movement and helping to isolate it from the wider public.

State and national legislators also attacked student antiwar activists through laws denying financial aid to students who disrupted college activities and occupied campus buildings. Members of Congress

also proposed legislation to deny federal aid to institutions that failed to control student disruptions or refused to allow military or defense recruiting on their campuses. Although the latter proposals failed to become law, several states, including California, passed laws expelling and banning students who disrupted college campuses. A larger number of states passed laws pressing criminal charges against students who prevented other members of the university community from freely using university facilities. These laws effectively dampened student activism not only by removing disrupters from campus, but also by threatening all others with serious consequences for participating in protests.

In response to the 1970 protests, even President Nixon responded to the campus antiwar movement by creating a Commission on Campus Unrest, chaired by former Pennsylvania governor William Scranton. The Scranton Commission studied the May 1970 events at Kent State, using hundreds of photographs, interviews, and FBI reports to determine the reason for the killings. It asserted that the guardsmen were not properly trained to confront students, that riot control forces should almost never be armed with loaded weapons, that the weapons used were completely unwarranted, and that firing into the crowd of unarmed students, no matter how rude and unruly, was "unnecessary, unwarranted and inexcusable." While it condemned student disruption and violence, the Scranton Commission asserted that the solution to preventing campus disruption was to end the war in Vietnam, allow students to participate in university decision making, and make higher education relevant to the needs and interests of the students.

American authorities, therefore, reacted to campus antiwar activism in a wide variety of ways. On the one hand, some authorities on the university and national level supported the right of activists to peacefully assemble and voice their protest. University authorities even went so far as to create institutional structures to allow students a greater voice in shaping their university and their university's response to the war. On the other hand, the FBI and many state and federal authorities condemned the more radical antiwar activists and took strong steps to discredit and remove them from the universities. By accommodating moderate activists and isolating and removing radical students, authorities successfully divided the campus antiwar movement in the 1970s, making it less effective and contributing to its rapid decline after 1972.

Conclusion

University activism against the Vietnam War largely mirrored the evolution of the antiwar movement outside the universities. It remained minor and largely ignored by the university community as well as mainstream newspapers through 1964. Between 1965 and 1967, however, a more concrete antiwar movement took shape on many campuses across the nation. Faculty and students organized teach-ins to analyze and discuss the war, and to propose strategies for how to most effectively oppose it. Soon afterward, small campus organizations formed at individual universities to oppose the war at the local level and coordinate with the national antiwar movement off-campus. These individual organizations most often acted with little or no coordination with the off-campus antiwar movement, but all were influenced by the rhetoric and tactics of the wider movement. In 1968 and 1969, the campus antiwar movement became much more radical in terms of its tactics and rhetoric, and confrontations with authorities escalated. The peak of antiwar activism on campuses, however, came between 1970 and 1972, when nearly half of the nation's universities witnessed some form of antiwar protest. This period was literally the most explosive period of the antiwar movement on American campuses, with bombs being detonated on several campuses and violent clashes erupting between National Guardsmen and students across the nation. But as the war wound down, so too did on-campus activism against it, and after 1973, the movement rapidly disintegrated.

The campus antiwar movement utilized a variety of different tactics and focused its efforts on a number of different targets. Most student activists initially supported legal tactics, such as fasting, lobbying federal and state members of Congress, petitioning the federal administration and university authorities, and holding vigils. Some students, who had witnessed or participated in the civil rights movement, also used its sit-in tactic to draw attention to their cause and force authorities to confront the issues. As the legal tactics failed, the sit-in tactic became more appealing to the student movement, but as the sit-in tactic also sometimes failed, some students were willing to develop more violent means of resistance. By 1967, some parts of the campus movement approved of destroying draft cards and Selective Service records and vandalizing Reserve Officer Training Corps offices. As authorities resisted student demands, more students were willing to use violence as a tactic to express their outrage, to gain attention for their cause, and (in some

cases) to provoke a violent reaction that would "expose the nature of the beast." Confrontations with authorities consequently increased after 1967 and ultimately led to the decision on the part of a tiny minority of activists to use terrorism as a tactic.

Despite the large-scale and widespread protests of the late 1960s and early 1970s, one must also note that a very large number of American universities saw no antiwar activism and the majority of students never participated in the antiwar movement at all. The majority of students actually supported the war in Vietnam until the late 1960s. Universities in the traditionally conservative South witnessed less activism than their counterparts in other regions, and smaller universities in rural areas tended to have less activism than larger universities in urban areas. In the South and rural areas, students had less access to older pacifist organizations and well-known activists. They also confronted a stronger conservative backlash than did their counterparts elsewhere, making it more difficult for them to formulate an antiwar stance and take action on it.

The campus antiwar movement, therefore, had a mixed impact overall. On the one hand it failed to convert the entire campus community to its cause. On the other hand, it was successful in gaining the support of large numbers of students in the late 1960s and early 1970s. By getting these students involved, the movement exposed them to a variety of alternatives to American foreign policy and encouraged them to become more politically active in all aspects of their lives. The campus antiwar movement was also effective in drawing national attention to its demands and perspective on the war. Although that national attention may not have directly resulted in support for its demands, it did force Americans to confront the issue and learn more about the Vietnam War. The campus movement also attracted the attention of authorities and forced many of them to take a stand on the issue. Students were most effective in gaining support from liberal faculty and administrators. They had less success with local police, state and federal legislators, and presidential administrations. Perhaps most important, the campus antiwar movement contributed valuable resources to the larger antiwar movement, helping it to be more effective in the long run. Although the question of how much the campus and national antiwar movements contributed to American withdrawal from Vietnam is still debated, their role in at least questioning the war and forcing the federal government to explain its actions in Vietnam must be acknowledged. That the campus antiwar movement was one of the most significant social movements in recent American history cannot be denied. It involved a generation of students in direct actions, forcing them to question their government and take a stand for their beliefs. The long-term impact of that experience is yet to be fully understood.

Weatherman Underground Organization

Weatherman, also known as Weatherman Underground or the Weather Underground, emerged as the most radical and confrontational faction of the group Students for a Democratic Society (SDS) in the 1960s. SDS, the largest organization of the American New Left in that decade, emerged at the beginning of the 1960s, and the publication of the *Port Huron Statement* in 1962 set out the organization's vision of participatory democracy, a more inclusive and representative opening up of society. This notion came to define the early years of SDS. Influenced by their experience in the civil rights movement, the SDS established the Economic Research and Action Project (ERAP), which set about organizing the black and white working classes in primarily poor Northern inner cities, such as Chicago, Cleveland, and Newark.

Weatherman's emergence as a political force within SDS built on the increased radicalism evident within the organization after 1965. Participatory democracy gave way to resistance as mounting opposition to the Vietnam War propelled SDS toward further revolutionary rhetoric and action. After initial skepticism, SDS became involved in the antiwar and specifically antidraft movements. As the war intensified, so did SDS's reaction to events, culminating in the 1968 demonstrations at the Democratic Convention in Chicago, which was accompanied by an expanding revolutionary rhetoric. Weatherman emerged from these increasingly bloody confrontations with the symbols of authority.

By 1969, SDS, as the organization, was disintegrating, and Weatherman emerged as both a cause and a consequence of this descent into factionalism and chaos. The final death knell for SDS was heard at its national convention held in Chicago in June 1969, as Progressive Labor (PL) and Weatherman asserted their individual claims to SDS's radical mantle. Weatherman was born from the SDS faction RYM, so-named because of Mike Klonsky's 1968 essay *Toward a Revolutionary Youth Movement.* Klonsky's document deeply influenced the founders of Weatherman. He saw youth as a revolutionary class in itself, and he argued that to achieve revolution in the United States, organizers should move beyond the narrow confines of primarily middle-class students and reach out to the potentially revolutionary working class through youth. Marxist rhetoric also proved to be a strong influence on Weatherman doctrine, building on its position as the dominant political philosophy within SDS by the end of the 1960s. Indeed, Bernadine Dohrn, a key Weather figure, declared herself a "revolutionary Communist" upon her election as interregional secretary at the 1968 SDS convention.

"You Don't Need a Weatherman . . ."

The actual name "Weatherman" was coined at the SDS National Conference in Chicago in 1969, based on a line in Bob Dylan's 1965 song, *Subterranean Homesick Blues:* "You Don't Need a Weatherman to Know Which Way the Wind Blows." This line immediately stated Weather's rebellious and anti-authoritarian appeal and reflected its embrace of the counterculture and the rock-and-roll lifestyle that Dylan himself had personified. The 1969 conference was a pivotal one for SDS as Weatherman revealed its ideological beliefs, asserted its position at the forefront of SDS, and categorically ended PL's reign of influence in the organization. By the end of the conference, the balance of power within SDS had unequivocally shifted toward Weatherman. The national office now contained Bill Ayers, Jeff Jones, and Mark Rudd, and Kathy Boudin, Bernadine Dohrn, and Terry Robbins were all present on the Chicago demonstrations organizational committee.

The group organized the 1969 "Days of Rage"—fierce street demonstrations staged in Chicago with the intention of "bring[ing] the war home." Unfortunately for Weatherman, few radicals shared the members' desire to bring on government repression, and

the event proved to be less than successful. Initially anticipating the participation of tens of thousands of radicals, the group attracted only an estimated 1,000 people. The apathetic response by many young American radicals to the demonstrations in Chicago, together with the increasing surveillance by the police and Federal Bureau of Investigation (FBI), led the group to conclude that a large-scale revolutionary movement would not materialize from contemporary conditions in America. In mid-December 1969, the group transformed its collectives into small underground cells and withdrew from friends, families, and former comrades with the intention of attacking the United States from within. Inside these collectives, Weather members indulged in drugs, orgies, and harsh self-criticism sessions, with the intention of eliminating individualism and ensuring that all members were truly immersed in the Weather machine.

On March 6, 1970, a New York townhouse inhabited by members of Weatherman, and used by the group as a facility for manufacturing bombs, accidentally exploded. Ted Gold's body was identified from out of the rubble. Another Weather member, Diana Oughton, was only identified from the print on her severed fingertip, and only a communiqué from Weather confirmed that Terry Robbins was the third Weather member to perish in the explosion. Prominent Weather people Cathy Wilkerson and Kathy Boudin stumbled from the wreckage and promptly disappeared underground.

The townhouse explosion, while signaling a dramatic and categorical end to SDS's reign over the New Left, did not dissuade Weatherman from planting further devices in their underground war campaign against America. Weather took the credit for twenty or more subsequent explosions, primarily targeting buildings with symbolic significance rather than attempting to wreak collateral damage. In 1970, they attacked the National Guard Headquarters in Washington, D.C, and New York Police Headquarters, and in 1971, they bombed the Capitol Building. In September 1970, in an attempt to attract potential recruits, Weather broke Timothy Leary, a noted psychologist, philosopher, proponent of psychedelic drugs, and demi-god of the counterculture, out of a Californian prison. As the 1970s progressed, the emphasis on the counterculture diminished (reflecting Weather's belief that the system had coopted much of its rhetoric), but the nonfatal bombings continued, as did communiqués from the underground celebrating Weather's lifestyle and political beliefs.

Gradually, by the end of the 1970s and the beginning of the 1980s Weather people Mark Rudd (1977), Cathy Wilkerson (1979), Bernadine Dohrn, and Bill Ayers (1980) surfaced, and Jeff Jones and Eleanor Raskin were arrested in 1981. In October of the same year, an armed robbery of a Brinks armored truck in New York carried out by former Weatherpeople David Gilbert, Kathy Boudin, and Judy Clark under the banner of the May 19th organization and the Black Liberation Army resulted in the killing of a guard and two policemen. Clark and Gilbert were sentenced to seventy-five years to life, and Boudin, sentenced to twenty-five years to life, was released from jail in 2003.

Weather and the Black Panthers

Weather connected with fundamental concerns and anxieties consuming the black and white New Left. The failure to end both de facto segregation and poverty in the Northern, predominantly black, ghettos and the lack of actual success in the opposition to the Vietnam War convinced certain SDS members that Black Power strategies could have a profound effect on the white New Left. Moreover, the rise of Marxist thought within SDS was embraced by Weather and attracted recruits to the cause through their identification of U.S. capitalism as the ultimate enemy, with racism and imperialism as its inevitable subsidiaries.

Weatherman illustrated its commitment to the Black Panthers' perspective in their document *You Don't Need. . . .* Their desire to support the black revolutionary struggle was encapsulated in Weatherperson John Jacobs's slogan, "John Brown, live like him." Weatherman doctrine and discourse were derivative of Panther ideology and language. Indeed, the two groups used radical and Marxist terminology to describe the revolution and the establishment. It was their fundamental commitment to Marxism, and the belief that radicals of all colors should support each other in achieving the revolution, that helped forge an unofficial alliance between the two groups. Weatherman saw its support of blacks as a way of achieving their revolution, and the Panthers appreciated the role that white radicals could play in attaining this aim.

The alliance between the Panthers and Weather began to break down, however, at the United Front Against Fascism conference (UFAF) in 1969. The Weatherman refused to support a motion proposed by the Panthers that called for community control of the police by the Panthers in both black and white areas. Enraged by this rejection from a group that had ap-

pointed them the vanguard only months before, the alliance disintegrated at the 1969 SDS convention in Chicago. For many members of Weatherman, the break with the Black Panthers confirmed that they would have to do the job themselves. Weatherman, they concluded, must serve as the vanguard of the revolution after all.

Attraction of Weatherman

Those attracted to Weather were primarily white and belonged to the college-educated upper middle class. Bill Ayers's father was the chairman of Commonwealth Edison, the Chicago utility company. Silas Bissell was heir to a carpet-cleaning magnate's fortune, Kathy Boudin was the daughter of civil rights lawyer Leonard Boudin, and Mark Rudd's father sold real estate and was a lieutenant in the army reserves. Weather members had gained organizational skills and developed their political consciousness in the main body of SDS. Kathy Boudin was an ERAP volunteer, Mark Rudd was a key organizer at the Columbia sit-in of 1967, Cathy Wilkerson was editor of *New Left Notes*, and Bernadine Dohrn became the SDS national secretary in 1968.

Despite Weather's reputation and notoriety, the numbers actively working as Weather people remained small. Following the disintegration of SDS, the media and the left were keen to fill the void left by the organization's demise. Weather happily joined in exaggerating their influence and representativeness, even though by the time of its Days of Rage Weatherman had, at most, only 500 members in the entire country. In stark contrast, at its height SDS was estimated to have a membership ranging from 80,000 to 100,000. In all probability, the numbers committed to the Weather cause probably fell further as their retreat underground ensured a higher level of commitment than the overground action demanded.

Weatherman's revolutionary tactics ensured that it gained a committed following. Weatherpeople were politicized in the movement but were also increasingly frustrated by their inability to change the political situation in the United States, which they believed was responsible for the repression of blacks at home and the Vietnam War abroad. As the decade progressed, they were awakened to the belief in the necessary role of action and militancy to achieve political change. Weather developed a dual attraction as an organization that supported blacks and opposed the Vietnam War.

In addition to its prominent role in the battle against U.S. imperialism at home and abroad, Weather wanted to give New Leftist politics a more militant and confrontational edge.

Machismo

Machismo was often inherent in Weather's confrontational rhetoric and action. Weather members believed they would prove their strength in mind and body to the establishment, to others in the movement, and to their fellow Weatherman members. A cult of violence therefore grew up around their tactics. The movement offered both men and women an opportunity to indulge in actions and in aggressive rhetoric that their middle-class upbringing disallowed. Moreover, inherent to this macho image was its glamour. Their association with Bob Dylan, their outlaw status, and their connection with the counterculture all enhanced the Weather's appeal.

The group's use of violence and its confrontational rhetoric were attacked as both melodramatic and nihilistic by radical and liberal critics who charged that Weather engaged in violence for violence's sake, in order to increase the groups' macho and tough image. In the spring of 1970, the mainstream media was severely critical of Weather's indulgent and excessive approach to violence and the groups' melodramatic use of combat as guerrilla theatre. Former SDS member Todd Gitlin likened the Weather violence to "the most rageful [extension] of bad, abstract politics by other means." In retrospect, some members also agreed that the group often glorified violence, although they believed at the time the great emphasis was on the constructive role of offensive action. Bombings, they argued, could serve a useful purpose, and they began to liken their role in the United States to that of opponents of Nazism in Germany.

Women and Gender

The Weatherman's embrace of machismo had a significant effect on gender relations. The group was obsessed with smashing "wimpiness," and Weather leader Mark Rudd was determined that it would not be part of a "sissy movement." Certainly, the Weather rhetoric underlined the group's desire to present a tough and hardened image, and its obsession was with eliminating weakness. Their use of phrases such as "off the pig," "smash Amerika" and "bring the war home" reinforced Weather's preoccupation with machismo and confrontation. Moreover, the Weather view was polarized; all action became a way for members to prove themselves as revolutionaries. Those New Leftists who were not with them, they argued,

were clearly on the side of the "pigs," the derisive term used in the 1960s for police.

Weatherman's focus on machismo, aggression, and confrontation did not preclude women from becoming leaders of the group or successfully exercising influence on the group. Moreover, women's traditional gender roles as passive and subservient gave way to the notion of active and strong. Indeed, women played a key role in the upper echelons of the organization. Bernadine Dohrn, Kathy Boudin, and Cathy Wilkerson had prominent roles in the leadership of Weather and wrote books, pamphlets, and statements pertaining to their role as women in Weatherman and in the revolution. Although the group's machismo did inhibit some individuals, it was also a tool of political expression, a desperate last throw of the dice, which proved beguiling in an era where traditional political expression had been found wanting. Weatherman, however, only offered men and women in the group a very narrow outlet for their political desperation. As a consequence, both male and female members of Weatherman displayed a very rigid and unyielding macho collective identity, which had considerable repercussions on gender relations within the group.

Weather perceived women as playing a salient role in defeating imperialism. In both strategies, the creation of an aggressive front and macho identity was paramount. First, Weatherwomen would employ this confrontational edge to become a fighting force equal to their male counterparts in Weather. Second, women's active participation in the revolutionary struggle would combat the imperialist society's perception of women as passive and would ultimately defeat the ethos of male chauvinism that was allegedly at the heart of America's capitalist society.

Various position papers and articles by Weatherwomen reinforced both their fundamental belief in the necessity of violence and their position at the forefront of this action. Women's attempt to present themselves as strong, aggressive, and revolutionary was fundamental to Weather doctrine, which stated that women would gain their own liberation only through fighting against racism and capitalism. On the issue of women's liberation, the group argued that revolution should preempt any plans for female liberation. It identified capitalism and imperialism as the enemy, and thus it argued that women should be wholly engaged in fighting against the powers of oppression and for the revolution rather than singularly concerning themselves with the rather narrow aim of achieving their own liberation. Imperialism was the root of all types of oppression, it asserted, and as women combated imperialism they would be taking a large step toward both conducting revolution and realizing their own liberation.

Weather saw women's active participation in the Weatherman campaign as a way to increase the numbers participating in and the effectiveness of the revolutionary armed struggle. "Political power," *Honky Tonk Women* stated, "grows out of the barrel of a gun, and the struggle to gain and use political power against the state is the struggle for our liberation." In addition, women could play an active role in defeating imperialism by utilizing their macho personas to challenge the perception of women as passive. This perception, they stated, was propagated by the capitalist system, which led to male chauvinism and women's oppression in all walks of life. Weather identified the male chauvinism within society as oppressive to women. Capitalist society, Weather argued, pressed women into fulfilling a traditionally feminine, passive role that diverted their revolutionary potential.

Anti-Monogamy

Weather also saw the rejection of monogamy as fundamental to their desire to "smash imperialism." The rejection of conventional relationships in favor of experimentation with multiple and same-sex partners was viewed as a way to eliminate bourgeois ideas from Weather members as well as fostering a spirit of camaraderie and solidarity. The group's anti-monogamy stance was presented as a means of eliminating sexist attitudes and exploitation, as well as a way of increasing women's self-influence and power over their own sexuality. Men and women were equally vociferous in their advocacy of anti-monogamy. They believed that monogamy repressed women and was central to the existence of male chauvinism in capitalism. Thus, women's sexual liberation would lead to their advancement both personally and politically. Indeed, in repudiating monogamy, women would be liberated sexually, socially, and politically.

While Weather documents identified the male chauvinism within their group, its criticism was aimed at the male chauvinism inherent within society. Because Weather's target was chauvinism resulting from American capitalist society rather than identifying a particular problem in their group, the group failed to equate male chauvinism with the macho attitudes that it embraced. More understandably, women outside Weatherman criticized the existence of machismo. Most vociferous in their attacks were radical feminists. Bread and Roses, a women's collective from Boston,

and former SDS member and women's liberationist Robin Morgan led the criticism.

Strong, combative language, symbolism, and action attracted recruits, who, as already stated, were overwhelmingly white middle-class youths. Also attractive to potential recruits were the exhilaration and glamour of being part of the tight-knit group that was actively confronting American racism and imperialism. Only through confrontational rhetoric and action, Weather believed, would the revolution be achieved.

The difficulty of sustaining an underground existence, the complete commitment demanded of recruits, the Weather's tiresome lifestyle regulations, infiltration by the FBI, and police arrests of Weather members ultimately caused the organization's numbers to peter out during the 1970s.

Ethnic and Group Identity Movements

INTRODUCTION

This section of the encyclopedia examines non-European ethnic movements that have taken place in the United States since the 1970s, as well as the senior citizens and disabled movements of late-twentieth-century America. Although these movements are dissimilar, they all emerged from the civil rights movement of the 1960s and 1970s, and continue to press for equality and redress of historical grievances.

ETHNIC IDENTITY MOVEMENTS

European settlement of North America came at the expense of displacing and conquering the native inhabitants who had lived on the continent for thousands of years. The colonization of North America by the Spanish, Dutch, British, and French is unique compared to that of other continents since it subsequently led to settlement—initially of Europeans and Africans, and subsequently of immigrants from the world over. Today, North America, and the United States in particular, is the world's leading recent region of major settlement, and the immigration, with ebbs and flows, has continued unabated over the last four centuries.

The United States of the twenty-first century is a diverse and multicultural country comprised of emigrants from throughout the world. The dramatic gains of the civil rights movement spawned the development of new waves of ethnic identity of nonwhite groups that have long been excluded from the mainstream of American life. Although immigration is perhaps the most defining characteristic of the United States, opposition to the settlement of newcomers and subsequent ethnic subordination has occurred throughout its history. The entries in this section on nonwhite ethnic identity movements examine the interplay between chauvinistic American exclusionism and the responses by racial, ethnic, and religious groups to isolation, intolerance, and subordination.

Despite being immigrants themselves, settlers arriving in America asserted proprietary rights to the land and opposed new migrants who continued to flow to these shores. At times, opposition to emigration exploded into nativist movements against the newcomers from different regions of the world and succeeded in imposing restrictions and exclusionary laws against new groups. From the time of colonization, virtually no group of émigrés was excluded from these forms of chauvinism, expressed through ethnic violence, political parties, and powerful movements that gained national prominence. Ethnic exclusionism, ebbing and flowing, remained a strong part of the American system from the country's origins until the civil rights movement challenged the subordination of blacks by whites. Subsequently, in the 1960s, people of color and ethnic minorities have initiated efforts to ameliorate discrimination from mainstream society. To this day, ethnic identity movements are organizing to oppose discrimination against their cultural and national identities, contesting efforts to marginalize immigrants of color from Latin America, the Caribbean, Asia, and Africa, as well as Native Americans.

This section examines the underpinnings of each of the movements in the 1960s to the present and the constellation of forces lined up in favor and against people of color in the United States. A common thread that unifies opposition to movements of color is the sense that the United States is somehow under siege by foreign or "alien" influences that must be removed from the society. Moreover, exclusionist groups generally had an idea of Americanism that frequently was not shared universally by others.

Ethnic Responses

Ethnic minorities have responded to discrimination and social, cultural, economic, and political repression by forming organizations for the advancement of their groups and by mobilizing in communities and in politics for fairness and equity. Much of the lessons learned by movements of color stemmed from the

civil rights movement of the 1960s and 1970s. In past generations, immigrants sought respect and equality with the descendants of the earliest waves of white immigrants from northwestern Europe. Through the nineteenth and twentieth centuries, waves of German, Irish, Eastern European, and Southern European immigrants sought tolerance and acceptance from the dominant groups that preceded them. What all had in common were their European backgrounds.

Non-European immigrants had never been accepted equally in American society through the mid-twentieth century. Similarly, the emergence of authentic movements seeking dignity and respect from the dominant culture were never taken seriously, even though many could trace their heritage to North America or descended from groups that arrived in the United States well before many Europeans.

Far and away, the most influential ethnic mobilizations occurred among long-repressed Native Americans, Latinos, and Asian Americans in the 1960s and 1970s, in the wake of the civil rights movement. The fight for the end of repression and legal segregation, and for economic opportunity for African Americans, a struggle that continues to this day, paved the way for other nonwhite ethnic groups to make similar demands for equality. Demands for civil rights were not fully achieved, and, in fact, have been turned back through the persistence of racial discrimination in the last three decades.

The entries in this section covering nonwhite ethnic movements of the 1960s and 1970s demonstrate that the specific demands of various groups for justice and equality—combined with direct action—have led to modest gains. Like the civil rights movement, groups have in many instances been successful in achieving their goals; however, by and large the federal government has not honored them. Although the demands by nonwhite minorities have followed the civil rights movement, they all have been distinctive in terms of their goals and objectives. Each of the groups' demands was aimed at redressing specific long-standing grievances against the government and achieving justice in their communities. Native Americans demanded the right for self-determination, the return of land and water rights, and the end of repressive government policies.

The emergence of the American Indian Movement (AIM) in the 1960s was directed at changing government policies through tapping into the Native American's sense of pride and cultural resilience. The founders of AIM used the Black Panther Party as their model—one that emerged from among the most repressed members in prisons who backed up demands with militant action. The movement for Red Power demanded improved housing and greater opportunities for Native Americans in urban areas in the upper Midwest with demands for greater land and water rights in rural areas of the West.

Although the nonwhite ethnic movements gained inspiration from the civil rights movement, their demands were not necessarily equivalent. The demands made by Mexican Americans, other Latino immigrants, and Asian Americans were for labor rights, respect for cultural identities, and bilingual education. Mexican Americans, many of whom are descendants of indigenous populations, make up the vast majority of new immigrants in the United States. A critical issue for all nonwhite immigrants, and Mexican Americans in particular, is economic opportunity and the end of labor exploitation. Although Mexicans have lived in the Southwest since before the settlement of Europeans in the region, many were recruited into the *bracero* program during World War II to work in low-wage jobs in agriculture. The vast majority of Mexicans in the program were migrant laborers who worked from dawn to dusk and lived under extremely harsh conditions. After the war, Mexican Americans in the Southwest lived in poverty, were denied educational opportunity, and were consigned to the lowest-wage jobs in agriculture and construction. Moreover, Mexican Americans faced significant discrimination in all walks of life.

Since the beginning of the twentieth century, commercial agriculture in the West had depended on low-wage Mexican-American migrant labor. Indeed, workers throughout the twentieth century organized themselves into unions to defend their rights and increase their low wages. However, it was not until the emergence of the United Farm Workers (UFW), a labor union led by Cesar Chavez, that the struggle for Mexican-American labor rights transformed itself into an authentic movement. During the 1960s and 1970s, UFW workers demanded higher wages and better treatment. The blossoming of the movement took place as more workers went on strike against farm employers for better treatment and higher wages. What made the movement so powerful is that workers engaged in autonomous direct action and strikes against farm owners, backed by the UFW, which typically had no bargaining agreements or contracts with employers.

The section also examines the *Mutualista* movement, which demonstrates how Latinos in the South-

west, through hard work, solidarity, and mutual aid, have built and maintained their rights and dignity.

Finally, this section takes a look at the Asian-American efforts of the 1960s and 1970s, which demanded cultural dignity, economic opportunity, and civil rights for this group. The movement shared many of the demands of the African-American civil rights movement, including achieving greater recognition of Asian Americans' contributions to American history, reforming the curriculum, establishing ethnic studies programs, mitigating poverty and the disparate impact of urban redevelopment, and combating police brutality through the Asian-American parallel to the Black Panthers, AIM, and the other ethnic identity organizations.

Nonethnic Minority Movements

The entries in this section examine the development and expansion of the senior citizens and disabled movements, two nonethnic minority movements demanding equality, respect, assistance, and resources. The senior citizens movement is perhaps one of the most successful social movements in the history of the United States. Among the senior citizens' achievements in the twentieth century were monetary and medical benefits, in the form of social security and Medicare. The senior citizens movement typically expanded in times of social unrest, such as the Great Depression of the 1930s, which impoverished the elderly, and the civil rights movement of the 1960s, which demanded greater social protection and equal opportunities.

Senior citizens movements have also called attention to social injustice faced by the elderly. As life expectancy has increased, senior citizens have organized against "ageism," against preventing capable individuals from remaining employed, and against preventing capable individuals from participating in leadership positions. In the 1970s, senior citizens formed the Gray Panthers in order to educate the public that the elderly have the ability and right to work and to vitally participate in society. Over the last three decades, the influence of the Gray Panthers has ebbed and flowed as the group has taken up issues of war and peace, social injustice, including the need for universal health care, housing, and equality. As the baby boom generation moves into retirement age, pressures on the system may revive the senior citizens movement as new demands for retirement income and comprehensive medical coverage reemerge and expand.

This section also reviews the emergence of the disabilities movement over the course of the last century. This movement emerged out of the abject discrimination faced by those with physical, emotional, and behavioral difficulties. In the twentieth century, the disabilities movement expanded to include rehabilitation of the poor into the mainstream of society. The movement has achieved significant successes through educating the public and through passing laws to protect the disabled. The movement is personified by the diversity of people with disabilities, extending to all social and economic classes and racial and ethnic groups. The movement achieved its most important advance with the passage of the Americans with Disabilities Act in 1990, entitling all those with disabilities to equal protection and due process under law. Still, disabled persons seeking access and full participation in society continue to face hurdles in their effort as resistance continues to the full implementation of the law on a national basis. Some states and private businesses have resisted the implementation of policies that enhance the ability of the disabled to actively participate in society, calling attention to the cost and difficulty in changing entrenched policies.

Immanuel Ness

Nonwhite Ethnic Identity Movements

The social movements of the 1960s and 1970s—civil rights, women's, and antiwar—transformed the American political, social, and economic landscape. These movements succeeded in rattling powerful interests by exposing and beginning to address systematic inequality in the United States. These three social movements—the civil rights, women's, and peace movements—continue to this day, for many of the goals and objectives for racial and economic equality remain elusive.

The broad scale of these movements has tended to diminish the importance of the nonwhite ethnic movements (Chicanos, Latinos, Asian Americans, and others) which also have struggled for social justice through protest and rebellion. The nonwhite ethnic struggles, though standing in the shadow of the movements for racial and ethnic justice, have nonetheless realized significant gains for Americans who have long been marginalized. Although a growing body of literature documents the activities of movement participants, it has generally done so without considering the interplay of these nonwhite ethnic movements. With the possible exception of the excellent account by scholar and activist Manning Marable, in *Race, Reform, and Rebellion: The Second Reconstruction in Black America, 1945–1990* (1991), the multifaceted and multicultural nature of the ethnic and racial nationalist movements of the era has been ignored, even though the struggle for self-determination was more than a black-and-white affair.

Influenced by the Black Power movement but also responding powerfully to the social, cultural, economic, and political repression of their own communities, not only African Americans, but also Native Americans, Mexican Americans, Asian Americans, and white ethnics (generally Southeastern Europeans whose whiteness was called into question through the mid-century), mobilized their communities, sometimes alone, sometimes together, to push the civil rights movement to more radical ends. What united them in the era after World War II, which Studs Terkel has called the "Good War," was a growing global unease with American cultural, economic, and military power, underscored by the Vietnam War, decolonization, and what Alexis de Tocqueville called the revolution of rising expectations—a belief that social movements cohere and expand when oppressed groups see positive change as attainable.

Having achieved moderate reforms in the civil rights movement, activists wanted more: not just integration but the right to self-determination, policing their own communities against official brutality, forcing promises to be honored, and asserting their place in American history and culture at the same time as calling into question American history and culture. Ethnic and racial pride was asserted across the color spectrum.

The Black Power movement was the primary catalyst for other nonwhite ethnic groups as they protested against economic and social repression.

Military Veterans and the Ethnic Identity Movements

The nonwhite movements of the 1960s and 1970s tended to be initiated and led by World War II veterans as they returned to the United States from the war only to face the abysmal treatment of their own ethnic groups at home. War veterans, who often served in segregated units, came back with a desire to join in the fight to end racial discrimination in the United States in education, housing, and healthcare. Leaders who made the transition from government service to movements for justice were Mexican-American Cesar Chavez, who joined the Community Service Organization before turning to a lifetime of service as a fieldworker organizer; Mike Masaoka, a Japanese American who served in the 442nd Infantry, and lobbied the government for the repeal of laws discriminating against Asian Americans; and Native American Russell Means, who played an important

role in the American Indian movement. Their status as veterans gave these individuals popular legitimacy. Moreover, their keen awareness that while they were free to die for their country they could not share in the social wealth of the nation lent passion to their cause. Armando Rendón's *Chicano Manifesto* (1971) argued that World War II "alerted" the GI "to his rights and awakened [him] to the advantage of a life he somehow felt could no longer be denied him."

James Izumazaki, drafted before Pearl Harbor, volunteered to serve in the army and was added to the 442nd. He recalls in his 1990 oral history that, after serving in the army, he returned to the strawberry fields of Watsonville to find his wife and parents "housed in an abandoned shack on the St. Francis School property near College Road." Soon after his homecoming, a gas station attendant refused to sell him gas and pointed to a six-foot-high sign proclaiming "NO JAPS." Izumazaki's response was emblematic of the ethnic minorities' determination to end such civil rights abuses:

> I told him I just got back from France with a Purple Heart and left a kid brother buried in Epinal, so he better call the cops because I wasn't going to leave without any gas. Reluctantly, he filled me up. As I drove away, I figured our "battle had only begun!"

The Cold War and Decolonization

The Cold War played a complicated role in the rise of ethnic and racial nationalism during the 1960s and 1970s. The Cold War made the influence of international actors in the Third and the so-called Fourth World more salient. Because the United States was engaged in a war against the Soviet Union, it sought allies throughout the world to contain the Soviet threat. To legitimatize the U.S. model of democracy and free markets vis-à-vis the Soviet model, emigrants from newly independent countries in the Third World framed their appeals for repeal of discrimination here at home in terms of Cold War imperatives.

Decolonization in Africa, Asia, and the Caribbean made the leaders of the various ethnic movements acutely aware that downtrodden groups could change their lot through hard work and vision, and it offered the opportunity of bringing attention to their plight before an international audience, which could then pressure the United States to reform its policies.

During the post–World War II era, ethnics in the United States were rarely passive in the face of discrimination. What set the ethnic movements of the 1960s and 1970s apart from previous eras was the tactics used and the emphasis on political and cultural self-determination, and redress of historical grievances. They abandoned the predominantly legal methods used by the NAACP, the League of United Latin American Citizens, and the Mexican American Movement during the earlier civil rights movement for more militant acts of civil disobedience that were, in part, also a legacy of decolonization. The march of the Mexican Americans and Native Americans echoed Martin Luther King Jr.'s March on Washington. La Marcha de la Reconquista was a three-month-long event that took Chicanos from Calexico, California, to the state capitol to protest the Mexican people's daily suffering and humiliation. But new was the increased use of occupations in place of sit-down strikes by the Native American and Mexican-American movements. The Indian occupation of Alcatraz and the Brown Berets' occupation of Santa Catalina Island soon after, in 1972, exemplified the militancy of the new ethnic movements.

Although the Latino, Native American, and Asian-American ethnic movements were distinct from each other, their goals overlapped and ultimately they built coalitions around common concerns such as education and civil rights. One notable example was the struggle for curricular reform as exemplified by the development of the Third World Liberation Front at San Francisco State University and University of California at Berkeley (UCB) at the close of the 1960s. Both schools were the sites of early civil liberties activity originating in student protests against the meeting of the House Un-American Activities Committee in San Francisco in May of 1960, and many students, both whites and Asian Americans, were sensitized by the civil rights cause.

In 1965, Ben Fong-Torres remembers in his autobiography *The Rice Room: Growing up Chinese-American: From Number Two Son to Rock 'n' Roll* (1995) being assigned to write about Freedom Week for San Francisco State's student paper, the *Gater*, and participating in a demonstration in which a shortened version of Mississippi's actual registration test was given: of the eighty-five participants, eighty-three failed the test given to blacks. Among the demands were an Ethnic Studies department with student-run curriculum. At UCB the Third World Liberation Front launched a movement between January 19, 1969, and March 14, 1969, for what William Wei's *The Asian-American Movement* (1993) terms an "autonomous Ethnic Studies program" and greater student control of faculty and the curriculum to increase diversity and address community problems. Nelson Nagai suggests,

in Louie and Omatsu's *Asian Americans* (2001), why this was possible: "I grew up dancing to soul music and eating Mexican food. So when my black friends and Chicano friends spoke up, I listened and learned."

Uneasy Tension

The respective movements inspired each other but also competed for government legitimacy and funding. Rendón's *Chicano Manifesto* suggested that Mexican Americans shared many of the same desires as African Americans, including Eldridge Cleaver's desire to reassert the ethnic group's strength through the rhetoric of the Black Power and civil rights movements. For example, Armando Rendón, though eschewing the demand for land, promoted cultural nationalism, using the rhetoric of reparations: "The bill that Chicanos have to collect from America is a big one." But throughout the manifesto, there is also a hint of jealousy that African-American demands received more attention; it also reflects a downright division over the purpose of nationalism that is closer to the Native American position.

As Chavez's "The Lost Land" (1980) notes, some 70 to 80 percent of Chicanos were racially Indian. In addition, unlike all the other ethnic groups, both Mexican-American and Native American groups had treaty relationships with the United States, which significantly shaped their strategies and sense of understanding. Rendón's *Chicano Manifesto*, for example, insisted that Mexican-American nationalists desired respect for his way of life, for his culture, and for his language and was loyal to his "language . . . culture . . . history."

Like the Native Americans, Mexican Americans asserted the right to their authentic religious practices, in this case Catholicism, and rooted their claims to land and dignity in treaties made by past U.S. governments.

Inspiring White Ethnics

The nonwhite ethnic movements of the 1970s and 1980s achieved few tangible gains in the short run, and, in the long run, many of the gains were compromised by the conservative backlash that was ushered in during the Reagan years. Social and economic conservatives eroded bilingual education, cut social programs, increased penalties on unauthorized immigration, and never addressed fundamental issues of economic inequality. By the turn of the twenty-first century, Chicano organizing drives were typically defeated by large and small businesses, and Native American demands for land and self-determination were largely ignored.

Ironically, perhaps the most enduring legacy of the Black Power and nonwhite ethnic movements of the 1960s and 1970s is the rise of ethnic identity among white Americans. As Michael Novak explains in *The Rise of the Unmeltable Ethnics*, disillusioned white ethnics drew consistent analogies with the plight of racial minorities in order to garner more tolerance of ethnic differences in American society. Americans who once eschewed their ethnic heritage now took pride in their non-Anglo-Saxon roots. Novak and others called for a new cultural pluralism and drew attention to the destruction of the language and culture of the descendants of Southern and Eastern Europeans. Novak called attention to the disproportionate burden of these ethnics in defending a nation that did not confer equal dignity upon them.

Novak encourages white ethnics to resist Americanization, valorizing the Indians, slaves, and immigrants who resisted Americanization's emphasis on "dissolv[ing] network people into atomic people," as "people resisted the acid . . . refused to melt . . . the unmeltable ethnics." Thus, Novak calls for the state to educate its citizens in their own ethnic culture and for the citizens to expose themselves to others' history.

The Decline of Ethnic and Racial Nationalism

Why did the nonwhite ethnic movements decline so rapidly? In part, the decline can be explained by the repression, co-optation, public backlash, and achievement of their goals. First, for repression: COINTELPRO (an acronym for the Federal Bureau of Investigation's domestic counterintelligence programs to neutralize political dissidents) broke the backs of the most radical groups. Ward Churchill and James Vander Wall have described the operations of COINTELPRO in detail, from the poison pen letters fabricated to produce deadly splits intended to fracture organizations against Black Panther Party leaders Eldridge Cleaver and Huey Newton to harassment and arrests. Churchill and Vander Wall's *Agents of Repression: The FBI's Secret Wars against the Black Panther Party and the American Indian Movement* (1990) notes that these government efforts were intended to "increase paranoia," waste time, and "deplete their resources." Churchill, Vander Wall, Matthiessen, and Crow Dog all comment upon the FBI's suppression of AIM. The Brown Berets de Aztlan was a militant Chicano activist group that formed in the 1960s in the image of the Black Panthers, The Brown Berets, named after the hats they wore, were led by David

Sanchez and other leading activists to defend the rights of Chicanos in the United States. As Marguerite Marin and Oscar Acosta demonstrate, the group was alleged to have set fire to a hotel in Los Angeles on April 24, 1969, while Governor Ronald Reagan was speaking to educators. The allegations were revealed to be just that. Agent Fernando Suyama, ordered to infiltrate the Brown Berets, admitted to setting fires, firebombing a Safeway store, and urging the Berets to retaliate for the firebombing of their headquarters. Another agent for the Bureau of Alcohol, Tobacco and Firearms, Eustacio Martinez, was also identified.

At Stanford, the university established an African and Afro-American Studies program in 1969, abandoned its Indian mascot in 1972, and replaced its exclusive focus on Western culture in 1987. It took until 1996 for other protesting students to win a Comparative Studies in Race and Ethnicity program, as noted in the "DisOrientation Guide, Stanford University, 2000–2001." Indeed, in the spring of 1999, thirty years after the Third World Liberation Front demanded change at UCB and San Francisco State, students again set out to protest the neglect of Ethnic Studies, camping out in tents to gain the chancellor's attention, fasting, and being jailed. The impetus for this demonstration came from a conference appraising the Ethnic Studies movement's influence thirty years later on April 12–13. A day later, students demonstrated at Barrows Hall, breaking windows and chanting as they searched for the vice chancellor. Forty-six were arrested and called for amnesty. In two weeks, the situation heated up again when on April 29, students took to camping outside California Hall, the residence of administrators. A hunger strike commenced on May 4, producing eighty-three arrests. Ultimately, the strikers won the addition of eight faculty, the preservation of classes, a Barrows Hall mural, and a research center.

Japanese-American reparations were finally achieved in 1988. The public education feature, however, took almost a decade to get off the ground, and California passed its own state version of this program, the California Civil Liberties Public Education Fund, only in 1999.

Asian-American Studies has grown with the population of enrollees but is facing pressure to become relevant to the needs of new Asian immigrant groups, principally the Hmong, Khmer, and Vietnamese who migrated after 1975, during an era when the initial Asian-American movement was petering out. New issues engage activists: among them are hate crimes. The backlash of the Reagan era has been noted in Wei's *The Asian-American Movement*. More disturbing, as the 1980s and 1990s unfolded, Asian Americans and others found themselves organizing in response to a raft of hate crimes by forming the Committee Against Anti-Asian Violence from New York Forum 1986.

Backlash

Despite the modest gains of the nonwhite ethnic identity struggles, attacks on multiculturalism, which was the legacy of these movements, continued.

Harvard historian Arthur Schlesinger Jr. in *The Disuniting of America* (1991) balanced his assessment by rejecting strident separatism, though advancing cultural pluralism when it contributed to historical accuracy, and rejecting bilingualism as ghettoizing. But Jean Bethke Elshtain's *Democracy on Trial* (1995), for example, asserted that multiculturalism was "balkanizing" college campuses and, less convincingly, was "designed explicitly to entrench differences" and teach "exotic, mythic, and 'foreign' pasts." Critiquing Schlesinger and those of Elshtain's ilk, Lawrence Levine's *The Opening of the American Mind: Canons, Culture, and History* (1996), suggested that curricular reform had always been a part of the American past; that the canon had never been as set as its defenders had argued; and that even writers such as Herman Melville, whom the present generation considers traditional, were considered unworthy of canonical status.

Minority language rights and a sensitivity to the need for English as a Second Language granted under the Bilingual Education Act of 1967 (in California the practice was banned in 1879), and extended to other minorities under *Lau v. Nichols* in 1974, have not escaped controversy. Formally establishing limited-English students' rights to an equal education was one thing, but implementing the court's decision was another. Uncooperative officials in San Francisco and the sheer diversity in terms of the numbers of language minorities attending the schools made implementation very difficult. In addition, the cost of English as a Second Language (ESL) programs and a lack of commitment on the part of the tax-paying public for funding them has limited their availability. Although ESL classes are provided in large measure to interested refugees, voluntary immigrants face severe limits in enrolling in such classes. According to Angelo Ancheta's *Race, Rights, and the Asian American Experience* (1998), waiting lists for English as a Second Language classes extended into the tens of thousands in some cities. Moreover, the idea that minorities

should be allowed to use ESL rather than immersion has come under increasing attack. U.S. English, headed in part by S.I. Hayakawa, former president of San Francisco State, and an opponent of reparations, though not interned himself, has facilitated an English-only movement that has succeeded in making English the official language in a number of states. In addition, with the passage of Proposition 229 in 1998 California officially declared the bilingual education experiment dead.

Success has also brought its problems by the measure of many old community activists. This problem is, of course, an old one. Radicals elected or appointed to office often behave more conservatively than their constituency, and the old notion of the sellout was present in the criticisms of each movement. As Broyles-Gonzalez's *El Teatro Campesino* notes, El Teatro Campesino's *acto* of *Los Vendidos* called attention to this issue in the 1970s by depicting a woman sent by California governor "Ronald Reagan's office to recruit a token Mexican for the administration" touting an anglicized name and selling out her co-ethnics. In real life, the reaction to Congressman Henry B. Gonzalez of San Antonio is one example of this sentiment. Gonzalez has reversed himself: from demanding integration in the 1950s and 1960s, he now insists that the Chicano movement is practicing reverse racism.

Within the African-American community, this issue has been exacerbated by the bifurcation in the community created by the expansion of a small professional middle class that used affirmative action to integrate into the larger American society. However, by and large, working people and poorer members of its community have been left behind. In the 1990s, Republican U.S. Supreme Court justice Clarence Thomas became the lightning rod for this debate because of his treatment of his sister. She took care of Thomas's aunt while he was in law school, but his subsequent branding of his sister as a welfare queen became the subject of intense controversy. Offended commentators suggested that in so treating his sister Clarence Thomas had abandoned the old ethic of the Thurgood Marshall generation in which African Americans who had "made it" turned around to open up opportunities for other members of their race. For these activists Clarence Thomas and Uncle Thomas were the same.

At the same time, the Nation of Islam, an old representative of the underclass, has veered back and forth from the path Malcolm X envisioned. After Malcolm X's assassination, Elijah Muhammad reasserted his control; when Elijah Muhammad died, his son, Wallace Muhammad, took over and implemented Malcolm X's vision of working with others outside of the African-American community. This stance, however, proved controversial, and the Nation of Islam split, with Louis Farrakhan establishing his own racially separatist group in 1981.

Mexican Americans and the Chicano Movement

Mexican Americans have experienced their own Trail of the Broken Treaty: the Treaty of Guadalupe Hidalgo (1848). Under the treaty, Mexico was to cede 55 percent of its territory, including what are now the states of Arizona, California, New Mexico, Texas, and parts of Colorado, Nevada, and Utah. In exchange, Mexico received $15 million in compensation to cover damage to Mexican property during the war. In many ways, their treatment during World War II and its aftermath was also a catalyst for the development of an ethnic movement. Colonization, forced assimilation, linguistic and ethnically based discrimination, segregation, and disfranchisement made the experience of Mexican Americans similar to that of Native Americans. Indeed, a large number of Mexican Americans are indigenous peoples as well, and prejudices against Native Americans were often transferred to them. In *Chicano Manifesto: The History and Aspirations of the Second Largest Minority in America* (1971), Armando Rendón drew a parallel to the Native American situation, arguing that the Treaty of Guadalupe Hidalgo was similar to the American government's treaties with Native Americans, guaranteeing full citizenship and special protection to a group, cited the two groups' common experience with conflict over land, money, and cultural autonomy, and noted the government's efforts to destroy both groups' family life. The tensions between Mexican Americans and the larger society, however, had much more to do with this group's status as exploited laborers in the Southwest than with confinement to reservations, even as they experienced discrimination similar to that directed against Native Americans. They stood with and apart from African Americans, as signified in the southwestern sign "No Mexicans or Dogs Allowed" and high rates of incarceration, but were differentiated by their linguistic status. Since Mexican Americans did not speak the English language, they shared experiences similar to those of Native and Asian Americans. Mexican Americans stood with African Americans and Native Americans in at least having the formal right to vote before 1952.

Much of the land that is the West and Southwest of the United States today formerly belonged to Mexico; thus, like the Native Americans, Mexican Americans could claim that they lived in an occupied America. Those Mexicans who lived in the territory that the United States conquered, known as *Californios*, lost their land and status before the turn of the twentieth century as a result of banditry, race-related violence, vigilantism, and different concepts of land tenure. Biased juries denied Mexican-American victims justice, efforts to validate land claims entangled Mexican Americans in a web of debt to their attorneys, and the decline of the cattle industry forced Mexican Americans into the lower classes. After the occupation, many Mexican-American women and children were forced to work to help their families survive. Like each of the other groups, Mexican Americans faced residential segregation. After 1900, the declining *Californios* were reinforced by Mexicans fleeing civil war and the Mexican Revolution of 1910 and seeking economic opportunities, principally in agriculture, where growers prized the fact that Mexicans migrated back to their homeland rather than remaining around and seeking support when there was no work. The expansion of the war cut off immigration from other regions, and the Great Depression produced a massive drive to drive out Mexican Americans irrespective of their length of residence in the United States.

The Chicano Movement in Postwar America

Like African Americans, Chinese Americans, Japanese Americans, and Native Americans, Mexican Americans contributed their blood and sweat to World War II's war for democracy. During the war years, the

Mexican immigrants entered the United States as farm laborers under the Bracero program, in effect from 1942 to 1964. *(AP Wide World Photos)*

American and Mexican governments agreed to conditions for the importation of Mexican labor to ensure that agricultural employers had adequate labor when employees left for the more lucrative defense industries. Despite their contribution to the war effort, many Mexican Americans were still treated as second-class citizens after the war. Segregated restaurants, recreational facilities, and public schools, a continued lack of representation on juries, and employment discrimination were commonplace throughout the Southwest after World War II. With African Americans and Asian Americans, Mexican Americans were subject to racially restrictive covenants that prescribed their housing choices. In Two Rivers, Texas, a dead serviceman was refused burial. Even winners of the Congressional Medal of Honor were denied service in restaurants.

The first reaction was, as with the other groups, to mobilize for civil rights, and it was veterans who often took the lead. The American G.I. Forum emerged in the late 1940s in response to the Two Rivers incident.

Increasingly, as civil rights victories were achieved, some members of the various ethnic and racial groups came to demand more radical reforms. Some Mexican Americans sought to expand the rights of Mexicans living in the southwestern states of California, Arizona, New Mexico, Texas, and Colorado,

where some 85 percent of American citizens of Mexican descent resided.

As a result of the civil rights and antiwar movements, some Mexican Americans came to see themselves as having more in common with blacks and Vietnamese. Like the African Americans, they suffered high casualty rates in the Vietnam War, and some came to see the war as genocide against African Americans and Mexican Americans. Moreover, as the decolonization movement mounted and charges of American neo-imperialism increased, disaffected Mexican Americans began to see their struggle as analogous to the Vietnamese experience.

Decolonization had other effects. Among some Mexican Americans, it inspired a pride in their past that led them to reject the assimilationist strands of the initial civil rights movement. Oscar Zeta Acosta's *Revolt of the Cockroach People* (1989) rejected the Catholic Church in Los Angeles because he felt that the Church had encouraged the bombing of Vietnam. And Rodolfo Acuña, the author of one of the pivotal and most original studies of Chicano history, adopted the movement's attitude that the Chicano experience was one of internal colonization, as evident in the title to his work, *Occupied America: A History of Chicanos* (1990). Intriguingly, the War on Poverty that began in the 1960s to broaden access to social programs (healthcare, social insurance, child welfare) to people of color who had been largely excluded under the New Deal also inspired Mexican-American activism by training community members and freeing them up to dedicate themselves to their work on a full-time rather than part-time basis, but also because Mexican Americans became acutely aware of their inability to compete with more organized, more recognized groups like African Americans, and in frustration eschewed the bureaucracy to try to establish alternative institutions.

George Sánchez's *Becoming Mexican American: Ethnicity, Culture, and Identity in Chicano Los Angeles, 1900–1945* (1993) notes the transformation in direction these groups took by comparing them with the earlier civil rights groups: the Mexican American Movement (MAM) and the League of United Latin American Citizens (LULAC), which emerged in California and Texas, respectively, in the 1930s and 1940s. LULAC, organized in 1929 by businessmen and professionals, was oriented toward the middle class and opposed Mexican nationalism. LULAC asserted that Mexican Americans could be Mexican culturally and socially but needed to be American politically. MAM evolved from the Young Men's Christian Association (YMCA) clubs, promoted education as the route to social mobility, and associated closely with Protestant reformers.

By the 1960s, however, the assimilationist rhetoric of LULAC and MAM was under increasing attack. Some Mexican Americans recast themselves as "Chicanos," proudly appropriating a term that was meant to denote a lower-class and racially inferior status in contrast to an earlier tradition of emphasizing a whiter, Spanish heritage. This pride also translated into a political agenda for some—a desire for curricular reform that would accurately represent the contributions of Mexican-American laborers to the building of the Southwest, a general assault on derogatory stereotypes, and, in some cases, a more radical call for a return to the mythical state of Aztlán and redistribution of land.

Redistribution of Land and Political Protests

Two figures were key to the movement for redistribution of land: Alianza leader Reies Tijerina and Aztlán promoter Rodolfo "Corky" Gonzales, born Jack D. Forbes. In the general warring between Mexican Americans and Anglo settlers immortalized in border ballads, Tijerina's great-grandfather lost his life and his land. Like many of the movement leaders, Tijerina was born in the 1920s. Reared in Texas, he became a Southwest farm worker. As an itinerant preacher, he launched a crusade to recover his lost land and that of other Mexican Americans from New Mexico, insisting that the U.S. government implement the Treaty of Guadalupe Hidalgo's guarantee to property rights, which he believed would alleviate Mexican-American poverty and low self-esteem. Tijerina's principles, however, raised little support at home or abroad, especially in a Mexico that was dominated economically and ideologically by the United States since the 1930s. In June of 1967, a frustrated Tijerina and his followers in the Alianza Federal de Pueblos Libres (Federal Alliance of Free City States) raided the courthouse at Tierra Amarilla with weapons and were arrested. Tijerina was temporarily acquitted in 1968. However, he was jailed again in 1969, and after considering running for governor, he was convicted for assault with an intent to maim or kill his jailer and false imprisonment of the deputy sheriff. He was paroled in 1971 after promising to leave his Alianza post.

The more radical, less legalistic version of Chicano calls for redress came in the form of Rodolfo Corky Gonzales, born in Denver, Colorado, in 1928.

Leaving a childhood of poverty by boxing, Gonzales at first worked within the political system as the head of antipoverty programs in the early 1960s and of the Crusade for Justice, which promoted social services, legal aid, and vocational assistance. But in 1969 Gonzales broke with his earlier tactics when he proclaimed "El plan espiritual de Aztlán," in which he called for the liberation of what he and others perceived as the Chicano homeland, the Southwest. Gonzales was equally famous for the poem "I Am Joaquin," reflecting his questioning of the price of Americanization which cost him his history, pride, and affection for his parents. The Spiritual Plan of Aztlán and Acosta's *Revolt of the Cockroach People* suggest the impetus behind the call for regaining Aztlán. Members of the movement identified the Southwest as part of the Aztec empire and asserted that Chicanos were all descendants of these Aztecs, that they had never really left the land, and that they were entitled to establishing a separate state because they had contributed the labor that developed it.

Ethnically identified political movements also sprouted up throughout the Southwest. In Crystal City, Texas, José Angel Gutierrez, a master's student in political science, galvanized a third party—La Raza Unida. This party soon took control of both the local school board and city council. As with the broader ethnic and racial movements' questioning of the price of Americanization, the party attracted many with its anti-assimilationist position. In East Los Angeles, approximately 10,000 high school students from six high schools, with some leadership from college students, walked out for a little over a week in 1968. These students were angered by the high rate of Chicano dropouts, and what they perceived as an insensitive history curriculum, the lack of Chicano teachers and administrators, opposition to bilingualism, and a lack of investment in facilities and education that would allow Chicano students to succeed. They were mobilized, in part, by Sal Castro, a teacher who had traveled a familiar route of working within the system, including participating in the Viva Kennedy movement (a Mexican-American grassroots political movement in support of fellow-Catholic John Kennedy's presidential campaign), serving in a war (the Korean War), and using the G.I. Bill to attain a higher education. Ultimately, the protesters won the establishment of a Mexican American Education Commission by the Los Angeles Board of Education. Such blowouts then mushroomed elsewhere in the Southwest, including those in San Antonio and Denver, which had remarkably similar demands. At the university level in 1966–1967, similar sentiments flourished as Chicano students in MECHA (El Movimiento Estudiantil Chicano de Aztlàn) and other groups advocated, according to Marguerite Marin's *Class, Ethnicity, Gender and the Democratic Nation* (1991), cultural nationalism, central self-determination, an opposition assimilation, and ethnic pride, aligning themselves with the Native American and African-American conquered people forced into poverty and degradation.

Shattering Stereotypes

The assault on stereotypes permeated popular culture as well. Armando Rendón's *Chicano Manifesto* documented and denounced popular and academic stereotypes of the Mexican American as lazy, an outlaw, or good-for-nothing, from Frito Bandito of the chip maker Frito Lay to the Mexican-American stereotype embodied in El Marko, the mascot of Flair pens, to the lazy Paco of L&M who never " 'feenishe[d], . . . anything, not even a revolution." Even history books contained similar stereotypes, ignoring the contributions of Mexican Americans to the agricultural and mining industries of the Southwest, and characterized Mexican Americans as lazy and passive despite nearly a century of resistance to their mistreatment. J. Russell Smith's *North America* (1925) declared that it was "physically impossible for the Mexican to worry. . . . [They] are children."

A number of Mexican Americans argued that the denial of positive images in textbooks and the media denied Mexican Americans positive role models and contributed to the loss of racial pride symbolized in the desire of group members to bleach themselves white like African Americans by marrying a lighter-colored spouse. A participant in the Denver Chicano Youth Conference, Maria Varela notes that participants discovered "the true beauty in their souls during the years of occupation and intimidation. . . . Coca Cola, Doris Day, Breck Shampoo, the Playboy Bunny, The Arrow Shirt Man, the Marlboro heroes are lies. 'We are beautiful.' " The Mexican American Anti-Defamation Committee in Washington, D.C., and Involvement of Mexican Americans in Gainful Endeavors in San Antonio, Texas, worked toward changing these images.

Like the Black Panthers, Mexican Americans began organizing their own paramilitary organization. In 1967, the Mexican Americans formed the Brown Berets for self-defense against the police they viewed as an "occupying army," and organized throughout the Southwest. The Los Angeles chapter existed until

After *Chicago Tribune* columnist Mike Royko wrote an article with an offensive description of Mexicans, outraged readers tossed copies of *Exito*, the *Tribune*'s Spanish-language weekly, into a trash pile at the Tribune building on March 1, 1996. *(AP Wide World Photos)*

it was broken in 1971 and was sympathetic to the idea of Aztlán and curricular reform—indeed, its members often attended rallies to take the blows for protesters. Unlike the Black Panthers, Muñoz's *Youth, Identity, Power* notes, the Brown Berets eschewed Marxist/Maoist politics. The Brown Berets were the brainchild of eighteen-year-old David Sanchez, Carlos Montes, and Ralph Ramirez, a symbol of the repression confronting even the most ardent advocates of working within the system. Sanchez, as head of the Mayor's Youth Advisory Council of Los Angeles, locked horns with Los Angeles Police Department representatives and witnessed the beating of a man unconscious and the brutal arrest of his wife and daughter in 1967. The Brown Berets promoted guerrilla warfare. Playing on the tactics used by earlier movements, including the American Indian Movement (AIM), members of the Brown Berets occupied Catalina Island in 1972, exiting on the twenty-fourth day when ordered to do so, and participated in the Mexican-American equivalent of the Trail of Broken Treaties—La Marcha de la Reconquista from Calexico, California, to the state capitol.

Organizing Farm Laborers

It would be wrong to assert that no group had ever attempted to organize Mexican-American farm laborers. Early efforts to organize the largely immigrant migrant labor force in the first few decades of the twentieth century by the Industrial Workers of the World (IWW) had involved a polyglot, multilingual approach, but the IWW's focus was building workers' identities as workers; in the Depression era, the Communists infiltrated the labor movement during the Popular Front era, subordinating their calls for revolution to migrant workers' bread and butter issues. But it was Luis Valdez and the El Teatro Campesino group who worked with Cesar Chavez to build a strong union based on the cultural heritage of its members.

The United Farm Workers is popularly associated with the charismatic figure of Cesar Chavez, a third-generation Mexican American whose grandfather arrived in Arizona in the 1880s, ahead of the major waves of Mexican Americans to the United States. Chavez himself was born near Yuma, Arizona, in 1927, but despite the family's head start in the race for security, the Great Depression wiped out the families' landholdings in 1939. Initially condemned to an existence as a migratory farm worker in California, Chavez temporarily escaped the fields by joining the navy. Then, as a veteran, he joined the Community Service Organization (CSO) to achieve citizenship rights for all Mexican Americans. A formidable player in the farm labor movement, Chavez, as Muñoz notes, was revered as a hero by Chicano nationalists after he launched the first organizing drive in Delano to create a National Farm Workers Association in September of 1965. Chavez dramatized the plight of farm workers confronted by low wages, the lack of fringe benefits, and hazardous work conditions, including subjection to pesticides. But unlike one of his collaborators, Luis Valdez, Chavez was not a nationalist.

Although Valdez was a graduate of San Jose State University, and an adherent of working in the system for awhile through the Viva Kennedy Clubs and MAPA, he was also a convert to the Cuban experiment and a member of the radical San Francisco Mime

Troupe that opposed accommodation. Muñoz's *Youth, Identity, Power* notes that like the other student activists of his generation, Valdez was "repelled by the human disintegration of peoples and cultures as they fall apart in the Great Gringo Melting Pot" of Americanization. Valdez's troupe was especially important in organizing and raising money for the farm workers movement. Blending European and Mexican traditions, El Teatro Campesino drew especially on the "Rasquachi aesthetic" of Felipe Cantú, which in turn, as Yolanda Broyles-Gonzalez's *El Teatro Campesino: Theater in the Chicano Movement* (1994) points out, was "synonymous with . . . Mexican popular tradition" that reached back to the eighteenth century as a "counterhegemonic tool of the disenfranchised and oppressed" and had witnessed "a resurgence in connection with the Mexican Revolution and aftermath." Using stock characters familiar to a Mexican-American audience, El Teatro Campesino educated Mexican-American farm workers about their conditions, and how to change them, as well as asserting a pride in their history.

The movement established its imagined community through journals that acted as the resources of an imagined community, including *Aztlán* at the University of California at Los Angeles (UCLA), *El Grito*, and *Con Safos*; an expanding number of Chicano presses such as *Quinto Sol Publications* (Berkeley), *Barrio Press* (Denver), *Mictla Publications* (El Paso), and the *Chicano Features Syndicate* (Washington, D.C.); and theater companies like El Teatro Campesino. Like the other movements, it would meet its share of repression, but it would also struggle with the problem of a fractured identity as new immigrants were pitted against old as job competitors.

From the schoolyard to the courthouse in the land fight, to the universities and the fields, Chicanos asserted their right to be included in American society at the same time that they critiqued Americanization. No institution was sacred, not even the Church. Movement participant and legend Oscar Zeta Acosta, a Mexican-American lawyer who served a brief stint representing clients in a poverty center in East Oakland before moving to East Los Angeles, makes this clear in his autobiographical *Revolt of the Cockroach People,* which opens with an assault on the established Roman Catholic Church. That assault, Rendón reports, led to a riot and the conviction of ten individuals by an unrepresentative jury and fed the sentiment among some reflected in Rendón's *Chicano Manifesto* that the Catholic Church also needed to provide some redress because it had "helped the Anglo Americans to rob us of our pride" by demanding patience.

Asian-American Movement

In Joann Faung Jean Lee's *Asian Americans* (1992), Betty Ann Bruno, a mixed-race woman born to a Hawaiian mother and Irish Dutch father, recounts the road to self-discovery that she and her mother took in the 1960s and 1970s. Noting that her mother "subverted her own Hawaiian background when I was growing up because she's tried very hard to mainstream us," Bruno points out that her mother "as a result of my coming to grips with my ethnic identity . . . has gotten back into the Hawaiian thing" and acts as a sort of "guru in a Hawaiian community in Southern California," teaching "Hawaiian, lei making," folk lore, and "found[ing]" a Hawaiian civic club. In making this observation, Bruno makes two assertions that bear scrutiny in trying to understand the origins of the less well documented, less visible Asian-American movement: "none of that was happening during the forties and fifties. That all happened in the sixties and seventies. It's all a product of civil rights. When black people decided they would go back to their roots, I think all the ethnic groups in the country took a cue from that and said, 'Hey, we've got roots too.' "

Indeed, the roots of the African-American and Asian-American movements were quite close, although, as with the other groups, the overlap was not complete. Asian Americans shared with African Americans a desire to assert their cultural pride and urban problems, including poverty. Moreover, a considerable number of Asian-American activists recount their initial involvement in the African-American civil rights movement. And the Asian-American movement focused on many of the same things: asserting the ethnic groups' importance to American history, reforming the curriculum, establishing ethnic studies programs, mitigating poverty and the disparate impact of urban redevelopment, and combating police brutality through the Asian-American parallel to the Black Panthers, American Indian Movement, and Brown Berets: The Red Guards. But striking differences also existed. Established in 1969, the Red Guards were patterned after the Black Panthers' emphasis on self-determination, opposition to police brutality, and community service, with a twelve-point program that paralleled the Panthers' ten-point program. Yet, language politics set the Asian-American movement apart from the African-American movement, and the complications of Communist red-baiting tied activists' hands a bit more tightly. Moreover, by the 1960s and 1970s, Asian Americans, though clearly able to articulate a vision of a discriminatory past, had by then been proclaimed a model minority; convincing the public and politicians of their needs would be difficult. And lastly, although conquest and forced slavery had united the other ethnic movements in a pan-ethnic umbrella for a much longer period, Asian Americans came from numerous countries, many of which had been at war with each other as recently as World War II.

The first group to encounter discrimination, as the first to migrate in significant numbers, was the Chinese-American. Although public officials greeted the Chinese as laborers, their welcome was not always consistent. Competition exacerbated ill-feeling against the Chinese in the gold mines, where they were subject to foreign miners' taxes; after the railroad was completed and the Chinese workers moved to urban areas, their competition with white workers amidst the recession of the 1870s led to cries for their exclusion. The exclusion movement succeeded, and for generations the Chinese set the basic framework of discrimination and opportunity by which other Asian immigrants were treated.

Under this arrangement, basic rights were checked. The freedom to choose whom one married was limited by antimiscegenation statutes that were in force from the early 1900s up through 1948. The freedom to become a citizen was granted only to native-born Chinese, confirming the inclusion of only

whites and, after the Civil War, African Americans and persons of African descent as citizens. Alien Land Laws, applied mainly because of growing Japanese-American competition in agriculture, were patterned after the foreign miners' tax. When opportunities opened, they came intriguingly to the Chinese first. The Chinese were removed from exclusion and granted the right to become citizens regardless of where they were born in 1943 because of their status as allies; Filipinos and Indians followed in 1946, and Japanese Americans in 1952.

Asian Americans in Postwar America

After World War II, the movement to grant civil rights to Asian Americans gained momentum under the direction of Japanese-American returnees, but pan-Asian-American cooperation was tenuous at best, and the sense that Chinese, Japanese, Korean, Asian Indian, and Filipino American groups had common interests was lacking. Japan had invaded China and the Philippines and had held Korea in thrall since 1904. Asian Indians, who gained independence from Britain after World War II, shared a border with China and feared Chinese aggression.

Working with congressional representatives such as Clare Boothe Luce and Emmanuel Cellar, representatives of the Chinese, Korean, Asian-Indian, and Filipino-American groups labored fervently to ensure that they would see restrictions lifted.

Unlike African-American groups who were tainted with communism, Asian-American groups, with the exception of the Chinese, were somewhat better positioned in the immediate World War II and postwar years to press for their civil rights, given the fact that the United States viewed Asian countries as potential buffer zones in its containment strategy.

Japanese Americans, tainted by association in Americans' minds with Japan, had to await the war's end before they witnessed any progress in their civil rights. However, because of the leadership of individuals such as Mike Masaoka and the Japanese American Citizens League, they were in a strong position after the war to press for the lifting of racially discriminatory laws at the state and national levels. Masaoka insisted that the racist mistreatment of Japanese Americans would hamper American efforts to convert postwar Japan to democracy.

A Confluence of Influences

By the 1960s Asian Americans had achieved major civil rights victories but still lacked a pan-Asian identity. This changed in the 1960s as Asian Americans responded to the mobilization of African Americans and developed a sense of pride in their own past, acknowledged the welfare needs of a group often denoted as the "model minority," and worked to combat the racism.

The complicated influences of the emergence of a significant group of college students, their involvement in the civil rights movement, the influence of the African-American struggle, of decolonization, and more directly of the Vietnam War can be seen in the biographies of Asian-American activists. Helen Zia, now a journalist and formerly executive editor of *Ms.*, began a sheltered life in New Jersey to find her complacency destroyed by the turbulent times while a student at Princeton. Racism, the Vietnam War, and the Third World Center galvanized her involvement in the Asian-American movement and social justice issues.

Nobuko Joanne Miyamoto, member of the famous trio that produced *Grain of Sand* and other albums that helped Asian Americans identify with each other, was inspired to act by the Panthers, racism, and Vietnam. Having played the stereotype in theater to advance her career, Miyamoto returned to her roots to find strength after police killed her son's African-American father and activist. Maxine Hong Kingston recalls in *The Woman Warrior: Memoirs of a Girlhood among Ghosts* (1989) her initiation into the civil rights struggle with her refusal to type invitations for a racist.

As with African Americans, Chicanos, and Native Americans, Asian Americans asserted ethnic pride by rejecting the need to conform to the dominant standards of beauty. Maxine Hong Kingston's confession of her desire to eradicate her "bossy" Chinese voice for a more "feminine" American one suggests a common feeling of disease and its ultimate rejection. Amy Uyematsu's "The Emergence of Yellow Power in America" argued that Asian-American women, like African Americans, also attempted to transform themselves into whites by changing their eyelids, chests, and hair color. This low self-esteem was reinforced by caricatures and stereotypes in the popular media.

Among the images of Asian Americans in the media were the subhuman, the arch-villainous Fu Manchu, the childlike, desexed Charlie Chan, and the evil Dragon Lady. Part of this problem also was rooted in the lack of unstereotypical minority representation in the media. Ben Fong-Torres's *The Rice Room* (1995), recounting the era, noted that there were "no minorities on television commercials or series, except as maids and servants—or, of course, villains." In one of the

most direct challenges to the stereotype, a coalition of groups attacked stereotypes reflected in the use of yellowface or white actors to play Asians in *Miss Saigon.* Asian Americans for a Fair Media also worked to promote social change in the representation of Asian Americans.

Forging an Imagined Community

An imagined community was more pivotal to cementing the Asian-American movement together, and for Asian Americans written words and song became ways of identifying common experiences and goals with other Asian-American groups and communities of color. Movement participants read Fanon and Mao, but also listened to other media. The musical trio Chris Kando Iijima, Nobuko Joanne Miyamoto, and Charlie Chin's album *A Grain of Sand* (1973) performed this function, as did Chin and Iijima's *Back to Back* (1982). The lyrics recaptured Asian Americans' contributions to building the West and the harsh discrimination they faced, but also highlighted the importance of struggle in becoming something. While Chris Iijima emphasized in Steve Louie and Glenn K. Omatsu's *Asian Americans: The Movement and the Moment* (2001) that the music was not about pride, it provided a counter-narrative to "white supremacist narrative," and an "organizing tool." The group continued working to raise consciousness in the 1980s with *Grain of Sand: Music for the Struggle*, released in 1982. After its disintegration, with Iijima moving on to become a law school professor, Miyamoto continued the struggle in Great Leap, Inc., formed in 1978 before the break-up, which produced "Talk Story: A Musical Odyssey of Asians in America" and the multimedia "A Grain of Sand" set in the 1990s.

Further efforts to create an imagined community were apparent in the founding of movement journals *Gidra* (Los Angeles, 1969–1974), *Bridge* (New York Chinatown, 1971–1985), and *Amerasia Journal* (Los Angeles: UCLA, 1971 to present). The longest standing of these efforts, *Amerasia Journal*, offered Asian Americans an outlet to showcase their social science research and literature with others. In addition, the movement generated a number of repositories for the memories upon which the imagined community could be constructed. Among the most important has been the UCLA Asian American Studies Center, which produced *Roots* and recently contributed *The Movement and the Moment*. The Japanese American National Museum, in Los Angeles' Little Tokyo, serves a similar mission.

Asian Americans and Public Programs

The struggle to assert the Asian American's rights to inclusion in public programs was no more intense in the early days of the movement than in the struggle over the preservation of the International Hotel, which began in December 1968. The sixty-unit hotel, situated in San Francisco's Manilatown, housed a number of low-income and elderly Filipino and Chinese bachelors and became a symbol of the right to decent, low-cost housing within one's community. For six years a struggle raged over the building owners' right to evict the elderly tenants so that they could build a parking lot; in 1977 the activists lost.

For Asian Americans, however, admitting to poverty, given the heavy immigrant nature of the community, was a dangerous proposition. Maxine Hong Kingston reflects the community's fear of deportation on the basis of becoming public charges when she notes the community's unspoken rules that opposed reporting crimes or discussing the community's poverty or poor wages. This problem, in turn, was rooted in the fact, as Ben Fong-Torres acknowledges, that a considerable number of the early generation of Asian Americans, faced with the Exclusion Laws, had entered the United States illegally. In fact, when the federal government introduced a confession program in 1957 for illegal immigrants to clean up their status, many refused to participate out of mistrust.

Warren Mar, born in San Francisco's Chinatown in the 1950s, remarks in Louie and Omatsu's *Asian Americans* that "back then, there was no recognition of poverty in Chinatown." But with the emergence of the War on Poverty and erasure of distinction in privileges between immigrants and citizens, activists became bolder. Through the War on Poverty, Wei notes that San Francisco's Chinatown established a North Beach Economic Opportunity Council that provided services such as English Language, Planned Parenthood, and Self-Help for the Elderly. And one might assume that the War on Poverty programs, which Armando Rendon's *Chicano Manifesto* and Carlos Muñoz's *Youth, Identity, Power* note were the training grounds of Mexican Americans, served a similar role in the Asian-American community. Moreover, the programs opened up discussion of the community's problems, including drug abuse as a coping mechanism, gangs, substandard housing, and the damaging effects of urban renewal.

Poverty also often involved poor housing, and

Asian-American activists drew attention to this problem. The Intercollegiate Chinese for Social Action in 1968 publicized information on conditions in Chinatown, including the area's high rate of tuberculosis spread by overcrowding and unsanitary conditions. Harvey Dong suggests in Louie and Omatsu's *Asian Americans* that the I-Hotel battle was more than a fight about cultural preservation; it was also "about the actual conditions, the lack of heat, the overcrowded housing, lack of adequate plumbing, cockroach infestation." At the same time, efforts to change housing conditions could prove a double-edged sword. Two Stockton residents, Maxine Hong Kingston and Nelson Nagai, have recounted the horrible impact slum clearance had on their families, destroying businesses built up over years and forcing elderly immigrants to start their careers all over again from scratch.

Combating Stereotypes

Like the other ethnic movements, the Asian-American movement called for an acknowledgment of past discrimination and a presentation of histories that acknowledged the resilience and contributions of Asian Americans to the building of America. The controversy between authors Maxine Hong Kingston and Frank Chin, however, demonstrated that the effort to produce this history was not without its own difficulties.

Maxine Hong Kingston and Frank Chin, remarkably near in age, education, and career aspirations, found themselves locked in a battle over the representation of Asian America from the 1970s into the 1990s.

In a series of mixed-genre works, Kingston explored the persistence of Chinese Americans in American society, their contributions to American development, and the difficulties of negotiating two cultures. Her well-respected *The Woman Warrior* garnered numerous awards while it purveyed an often ignored female experience. Though often considered more as a story of gender relations, *The Woman Warrior*, based on Kingston's experience growing up from the 1940s through the 1970s, documented the racism Chinese Americans encountered, the disparate and generalizable impact of urban renewal projects on a minority community, the influence of the civil rights and African-American movements on the Asian-American movement, and the particular dilemma of Chinese-American activists, who might be tainted with Communism for their activities or deported for their activities. Her *China Men* (1980), a tribute to the contributions of Chinese-American men to the building of the West, similarly documents the racial hostility confronting Chinese Americans, the most poignant example of which is her insertion of a lengthy section entitled "The Laws," which lists the legal restrictions placed on Chinese Americans. *Tripmaster Monkey: His Fake Book* (1989), part a mischievous response to Chin's criticism, suggests the tensions between movement members.

Although Kingston's *China Men* began the process of claiming America by documenting Chinese Americans' contributions to the building of the nation via the railroads and plantations, Sucheng Chan's *This Bittersweet Soil: The Chinese in California Agriculture, 1860–1910* (1986) and Sandy Lydon's *Chinese Gold: The Chinese in the Monterey Bay Region* (1985) have revealed the pivotal contributions of Chinese Americans to the transformation of California's agricultural economy from wheat farming to fruit and vegetable cultivation at the end of the nineteenth century. Sandy Lydon's work, Charles McClain's *In Search of Equality*: *The Chinese Struggle Against Discrimination in Nineteenth-Century America* (1994) and Lucy Salyer's *Laws Harsh as Tigers: Chinese Immigrants and the Shaping of Modern Immigration Law* (1995) are among the works that have taken seriously Carey McWilliams's claims in *Brothers under the Skin* (1964) to illustrate the agency of Chinese Americans in challenging discriminatory practices, including the enforcement of immigration law. Judy Yung's works *Unbound Feet: A Social History of Chinese Women in San Francisco* (1995) and her collection of edited primary sources *Unbound Voices: A Documentary History of Chinese Women in San Francisco* (1999), have re-created the experience of Chinese-American women in community life and documented their struggles.

While rooted in the experience of Chinese and Japanese Americans, the Asian-American movement has begun to respond to the need to diversify its ranks to include the experiences and needs of the Southeast Asian-American groups that resettled in the United States in a series of waves in the 1970s and 1980s. Chan's *Hmong Means Free: Life in Laos and America* (1994) is just one example of a growing literature on the Southeast Asian refugee experience. And an increasing number of works on South Asians, a group that is both a part of, and yet apart from, the Asian-American community, including Lavina Dhingra Shankar and Rajini Srikanth's *A Part, Yet Apart: South Asians in Asian America* (1998) and Shamita Das Dasgupta, *A Patchwork Shawl: Chronicles of South Asian Women in America* (1998), suggest the vibrancy of this question.

Japanese Americans assemble for their forced relocation to internment camps during World War II. More than 100,000 Japanese Americans—most of them American citizens—were incarcerated for the duration of the war. *(National Archives)*

Reparations

The most radical demands of the Asian-American movement centered around reparations for the wartime incarceration of some 117,000 Japanese Americans, over two-thirds of them American citizens. Some monetary compensation had been paid for losses incurred under the incarceration, and, as noted, the incarcerated generation had gone on to pursue civil redress. But the militant rhetoric of the 1960s, and a sense of the United States government's lack of chastisement for the World War II episode led many to press not only for additional compensation, but also for a formal government apology for the incarceration, and later on, a rehearing of the court cases.

The backdrop for this revolution was partly established in colleges across the country as Asian-American students increasingly demanded and won the rights to establish Asian-American studies classes. These cases had important ripple effects because they sent home curious students, who then asked their formerly incarcerated relatives why they had been so silent about this episode. Take, for example, a pivotal player in the buildup of sentiment for redress: Jeanne Wakatsuki Houston. Incarcerated as a young child, Houston left the camps, enrolled in college, and graduated, then married and left behind her short-lived career as a social worker. But in 1971, her nephew, a student at the University of California at Berkeley (UCB), a center of the Third World College movement, came to visit her in Santa Cruz and revealed that while taking a sociology course he had heard talk of Manzanar for the first time outside the family. Houston's nephew's questions about her feelings drove her to write down her memories of the experience so that she would not go insane. The book, published in 1973 as *Farewell to Manzanar: A True Story of Japanese American Experience During and After the World War II Internment*, introduced a generation to the camp experience and its devastating effects on family life, as well as the mental health of the incarcerated. Indeed, while writing the memoirs, Houston suffered

from hysterical crying until she opened up to her husband.

A mixture of World War II survivors, veterans, and internees also helped the movement achieve its goals, including Michi Weglyn's *Years of Infamy: The Untold Story of America's Concentration Camps* (1976). The complicated interplay of these factors is described in two works, Leslie Hatamiya's *Righting a Wrong: Japanese Americans and the Passage of the Civil Liberties Act of 1988* (1993) and *Achieving the Impossible Dream: How Japanese Americans Obtained Redress* (1999), by Mitchell Takeshi Maki, Harry H.L. Kitano, and S. Megan Berthold. In 1988, the government issued an official apology for the internment and issued survivors checks for $20,000. This movement for redress, and for the overturn of the convictions of the three Japanese Americans who took the internment to court, was made possible, in part, by the Asian Law Caucus, which William Wei notes emerged in the 1970s, combining the talents of lawyers and law students in 1972 using money gained by defending Asian-American conscientious objectors. Since then, the caucus has defended tenants against rent increases, refugees, and bilingualism.

Mutualista Movement

Unlike nineteenth-century American fraternal associations that were influenced by medieval guilds and English friendly clubs, *sociedades mutualistas*, or Latino mutual aid societies, emerging in late-eighteenth-century New Mexico, were religious. Faced with the removal of Franciscan friars after the Republic of Mexico overthrew Spanish rule, villagers self-organized *La Sociedad de Nuestro Padre Jesus Nazareno*, or the Society of Our Father Jesus the Nazarene, also known as *Los Hermanos Penitentes*. Through annual replication of Lenten ceremonies and corporal acts of mutual aid, *Los Hermanos* provided spiritual support for sick and dying members, offered material assistance to grieving families, and provided moral order for their villages. With population movement northward into the San Luis Valley of southern Colorado, Hispanos transmitted mutual aid traditions into the isolated river valleys they settled.

Shortly after the U.S. military occupation of northern Mexico—what is today New Mexico, California, Arizona, and parts of Colorado, Utah, Nevada, and Texas—in 1846–1848, newspapers racially stereotyped Mexicans residing in land severed from Mexico. This huge region became part of the United States after the Mexican War ended in 1848. Resentment swelled as newly arriving emigrants publicly subordinated Mexicans as "greasers." New Mexicans rebelled, and the *Penitente* Movement was driven underground.

Faced with the need to combat similar incidences of race hate, Mexican Americans throughout the American Southwest formed *sociedades mutualistas*. In his seminal work, *Occupied America* (1981), Rodolfo Acuña attributes the creation of a Mexican-American underclass to the primacy of the railroad, industrialization and monopolization of resources, and speculative capital. In reaction to its members' treatment as outsiders in a region their ancestors pioneered, dispossession of their landholdings, and characterization as a source of cheap labor, the *mutualista* movement spread. The concurrent labor movement in Mexico influenced some *mutualistas* in border areas to undertake union activities.

The model of the *mutualista* movement in the Southwest is the *Alianza Hispano-Americana*. Founded in Arizona in 1894, the *Alianza* was the pinnacle of the *mutualista* movement in the Southwest. The *Alianza*'s successes in organizing Mexicano laborers, its civil rights efforts, and its educated leadership made the group into a political powerhouse. When insurance companies discriminated against its members because they all had "tuberculosis," the *Alianza* established affordable death benefits. Ultimately, the *Alianza* forged inroads for Mexican Americans to be included in the civil rights movement.

The *Alianza* was one of more than 100 *sociedades mutualistas* operating in Texas, California, Arizona, Colorado, and Utah with statewide leagues and affiliated lodges in small towns and urban centers such as Dallas, Tucson, Los Angeles, Albuquerque, and Denver. Although m*utualistas* adopted different names, focused on pressing local issues, and had varying organizational structures, their concerns for labor and common goals of equality and justice made them the early forerunners to the Chicano movement.

The *Mutualista* Response to Land Loss

By the last decades of the nineteenth century, speculators gained control of Spanish and Mexican land grants in New Mexico and southern Colorado after land rings dismantled claims through tainted judicial proceedings. Denial of access to the uplands was ruinous to the pastoral-based society living in the Rio Grande region (an area extending from the San Luis Valley of southern Colorado into northern New Mexico). With stock raising and pastures controlled by outsiders, villagers throughout the region were forced into low-paying jobs as itinerate agricultural laborers and ranch hands.

Undeniably, *mutualista* history in New Mexico and subsequently in Colorado correlates to the arrival of the Atchison, Topeka, and Santa Fe and the Denver and Rio Grande Railroad in the late 1870s. With rail access came an onslaught of syndicates specializing in land grant speculation. Acuña points out that the adaptive response of Hispanos was to self-organize the Brotherhood for the Protection of Rights and Privileges of the People of New Mexico to stop "corrupt politicians and monopolies." In about 1887, the Knights of Labor operating in southern Colorado joined New Mexicans in unionizing rail workers in Las Vegas, New Mexico. Because unions in the Southwest fractured along racial lines, the Knights became the first Anglo-American organization to work with Mexicanos. Correspondingly, a Hispano militant resistance movement known as *Las Gorras Blancas*, or white caps, spread into land grant areas from 1887 to 1896. Engaged in a fence and range war to stop homesteaders and land rings from gaining total control over Spanish and Mexican land grants, the *Gorras Blancas* eventually gave way to more moderate groups, including *La Sociedad Protección Mutua Por Ley y Orden*, or the Society for Mutual Protection Through Law and Order.

COLORADO'S *MUTUALISTAS* MOVEMENT

By 1900, *mutualistas* emerged in Colorado. Organized by Celedonio Mondragón, *La Sociedad Protección Mutua de Trabajadores Unidos*, or the Society for the Mutual Protection of United Workers, commonly known as the SPMDTU, formed in Antonito, Colorado, a platted rail town situated near the New Mexican border.

Trained as a *platero*, or jewelry maker, Mondragón opened his business in Santa Fe, New Mexico, in 1890. By 1896, he joined the pacifist-oriented *Sociedad Protección* in Las Vegas, as he frowned on violence. Later, Mondragón attempted to organize his own society in Las Vegas and Santa Fe. Unsuccessful and frustrated, he returned to Colorado.

Mondragón formed the SPMDTU after recruiting six like-minded residents to compose "*reglas*," or regulations, based on the rules of the Order of Saint Francis of Assisi and the organizing principles of *La Sociedad Protección.* Initially, regulations specified that *mutualistas* must be male between eighteen and sixty years of age, mentally competent, and free of legal blemishes. To keep the organization free of domination by special-interest groups, ministers and political bosses were banned. The obligations of *mutualistas* required attendance at meetings, payment of dues, and high moral standards. Mirroring lay Franciscans, members were "obliged to be compassionate and [to show] mercy," by practicing *hermanismo*, or brotherhood. As a means of identification, SPMDTU members used secret passwords and ritual handshakes, and wore *divisas emblemas*, or dual-sided silk badges. During SPMDTU functions, the solid-colored side of the badge was worn. When attending wakes, members reversed their badges to the black side, indicating a time of mourning. To symbolically depict the ideal of brotherhood, each side of the badge was embossed with an encircled pair of clasping hands. Self-identified as *hermanos*, or brothers, the SPMDTU initiated unemployment and sickness subsidies in 1910 and four years later adopted funeral and burial insurance.

Incorporated in Colorado in 1911, the SPMDTU's "Preambulo," or preamble, underscored land loss in the San Luis Valley. Located along the south-central border with New Mexico, the valley was settled by New Mexicans under the auspices of two Mexican-era land grants. Plagued as the valley was with bitter land disputes, it is not happenstance that the stated purpose of the SPMDTU was to provide "Protection against injuries of tyrants and despots, of usurpers of land and justice, and of those who take our lives, our honor, and property."

News accounts in the San Luis Valley's *Alamosa Independent Journal* amplified the need for the forceful preamble. Subsistence stock raisers from New Mexico settled Colorado under the promise of communal pasture, a lot for a home, and a small agricultural plot. With the enclosure of the commons by land companies and baronial ranches, tensions mounted. In January 1902, the *Journal* described how Hispano herders were threatened at gunpoint and forced to watch as their sheep, mules, and dogs were killed and their camp set afire. By June, intimidation turned to murder as Hispano sheepherders and prominent ranchers were killed. Toleration of Anglo-American assailants caused the *Journal* to observe that the "failure to assist in the capture and conviction" gave an appearance of "endorsement of the killing or winking at the methods of the highwaymen." Two years later, the *Journal* condemned the murdering of sheepherders and killing of hundreds of sheep, forewarning that "justice will have to be done . . . in order to stay a body of men whose rights the law fails to recognize."

With the onset of anti-immigrant sentiment after World War I, Hispano residents and workers from Mexico were targeted as unwanted foreigners. Whether through Ku Klux Klan extremism or in 1936

when Governor Ed Johnson attempted to stop Mexican laborers and New Mexican residents from entering Colorado by manning two checkpoints in the San Luis Valley with the National Guard, the xenophobic atmosphere altered SPMDTU membership. José Timoteo López, the SPMDTU's first chronicler, noted that racial animosity prompted the society to exclude non-Hispanos from membership, although individual lodges did not always enforce the regulation if an applicant had intermarried or was considered Hispanicized. With anti-immigrant sentiment questioning the citizenship and loyalty of all Spanish-speakers, the organization deleted "*Compatriotas Mexicano*," or Mexican Compatriots, from its preamble by substituting the term "*Hispano-Americano*."

Organizational Structure

Like the *penitentes*, the *mutualistas* met in the homes of members. Perhaps that is why gathering spaces often resemble domestic dwellings. In the first decade of establishment, eight *concilios* rotated meetings in different communities. Because of the great distances between lodges, members passed a resolution adopting a Spanish-language newspaper as their "official organ" of communication. Since phone service was a luxury in rural areas of southern Colorado and northern New Mexico before the middle of the twentieth century, Spanish-language newspapers were key to the success of the organization. From 1911 into the 1940s, five newspapers in southern Colorado and northern New Mexico published the SPMDTU's minutes and announcements in Spanish.

In 1950, on the golden anniversary of the founding, the SPMDTU counted sixteen lodges in the San Luis Valley, eight throughout Colorado, twenty-one in New Mexico, and three in Utah. Membership declined during World War II as men joined the military or migrated to work in defense industries. After the beginning of the civil rights movement, the SPMDTU deferred to the Chicano movement to challenge racial inequality. By the 1970s, widespread employee insurance caused membership to fall to 1,096. Despite this setback, members passed a 1978 resolution admitting women to the organization. In 1996, insurance coverage was transferred to the Western Slavonic Association, as it was impractical to meet the Insurance Commission's requirements for multistate coverage. When it celebrated its one hundredth anniversary in November 2000, the SPMDTU boasted eight councils in two states and 500 members. The organization continues to hold annual conventions and conduct meetings in Spanish. Currently, the SPMDTU is restoring its *Concilio Superior*, or Antonito headquarters, in anticipation of housing a museum and allowing more access to the community. In addition to their scholarship fund, the SPMDTU is working with the University of New Mexico, Center for Regional Studies, to archive their documents and publish their history.

The long-term success of the SPMDTU can be measured by three trends. Foremost is the self-reliance of individual councils. Traditionally, councils either rented a structure or purchased a lot to construct their lodge halls. Sweat equity and non-financial contributions of membership in the form of labor, dues, and fundraising is a testament to group unity. Situated in accessible locations and constructed of adobe (unfired earthen blocks), SPMDTU lodge halls were prominent features in villages. Used as polling places and for public fundraising events, the largest halls accommodated dances and recreational activities for membership. Second, the SPMDTU is unique as it is one of a handful of early *mutualista* organizations to survive time, outliving even the *Alianza*.

Finally and most poignant, is the ritualized burial of *mutualistas*. The SPMDTU ritual includes a wake, honor guard, and meeting at the gravesite. After taking a roll call, the eulogy commences. Wearing their *divisas* to the grave, the brothers toss *siempre viva*, or stonecrop, onto the coffin. Grave markers of members are often etched with the SPMDTU emblem, demonstrating unending loyalty. Acts of solidarity, continuity of the organization, and group loyalty are the hallmarks of classical social movements. Unlike mainstream benevolent organizations, which disappear after the crisis situation has passed, the SPMDTU continues because the custom of mutual aid in Latino communities has shaped an attitude of perseverance through intergroup cooperation.

Gray Panthers Movement

The Gray Panthers was created in January 1970 when six older professional women met for lunch to discuss a dual challenge: how to continue their activist protests with young people against the Vietnam War and how to fight forced retirement. That lunch planted the seed for what was to become the Gray Panthers, an imaginative, activist movement governed by a passionate belief in social justice.

Spearheading the gathering was Margaret E. (Maggie) Kuhn, a disciple of the sociologist Charles Elmer Gehlke and a forceful proponent of community activism. An active Vietnam War protester with vast social work experience, Kuhn was herself the victim of forced retirement from an executive position with the national Presbyterian Church. Other women who lunched that day were in the same boat: activists in the civil rights, antiwar, and environmental movements of the 1960s and either retired or on the brink of retirement. Eleanor French was director of the student division of the World YWCA in Geneva; Helen Smith was an executive with the United Church of Christ; Polly Cuthbertson was director of the American Friends Service Committee College Program; Anne Bennett was a religious educator affiliated with the Women's Strike for Peace; and Helen Baker was a United Nations reporter.

This early confluence of political and social commitment and aging was to become the Gray Panthers, a bold anti-ageist coalition of young and old, loud in its demands for increased public expenditure on social programs, cutbacks in military spending, a national healthcare program similar to Canada's, and the abolition of child poverty. Defining its mission as the creation of a better society for all ages, it crafted a broad agenda encompassing cross-generational concerns and using community organizer Saul Alinsky–type tactics to marshal support.

Its first official meeting took place in May 1970 at Columbia University's International House when word of mouth brought together 100 activists to form a new social action organization, the Consultation of Older and Younger Adults for Social Change. It adopted the slogan "Age and Youth in Action." These early members placed "ageism"—a term coined by Dr. Robert Butler to mean prejudices and stereotypes applied to older people sheerly on the basis of age—alongside racism, sexism, and militarism as among the great oppressive forces of the time. The group abjured (despite its burdensome name) identity as an old persons group or as a gray lobby. It was no accident that the Vietnam War was an organizing issue—"it identified us with the young," Kuhn later said, as Gray Panthers staged antiwar protests at draft board offices around the country.

The Gray Panthers came to life at a time when America was growing grayer. Advances in healthcare and quality of life had increased the average lifespan from sixty-four in 1940 to seventy-four by the 1970s. A surge in the over-sixty-five population segment marked the years from 1950 to 1975, as the elderly expanded from 12 million to 22 million, or from 8.1 percent to 10.5 percent of the total population. In 1970 alone, the elderly numbered 20 million (compared with 3.2 million in 1900), or roughly 10 percent of the population, and was growing at a rate of 900 a day. Nearly 25 percent lived below the poverty line, with only 9 percent enrolled in private pension plans.

Response to this burgeoning population came in the form of social and political initiatives to represent the old and their interests. The American Association of Retired Persons (AARP) quickly grew to more than 20 million, and membership in the National Council of Senior Citizens (NCSC) swelled. The U.S. House of Representatives set up a Committee on Aging (complementing the Senate's Special Sub-Committee on Aging), while the White House created the Administration on Aging (AoA) to represent elderly interests and launched the White House Conferences on Aging, forums on problems affecting the old. Passage of Medicare in 1966 helped ease some of the financial

MARGARET E. "MAGGIE" KUHN

(1905–1995)

Born on August 31, 1905, in Buffalo, New York, Margaret E. Kuhn was raised in the North so that she would not be exposed to the racial segregation her Southern parents had experienced. In 1922, she enrolled in Western Reserve University in Cleveland, Ohio, where she majored in English and sociology while also organizing a college chapter of the League of Women Voters. After graduation in 1926, she taught briefly and then took a job with Cleveland's Young Women's Christian Association, where she stayed until 1948 and developed an interest in social activism.

Kuhn's next significant job was as the associate secretary for the United Presbyterian Church in Philadelphia until she was forced to retire in 1970 at the age of sixty-five. She became an activist for social causes such as women's rights, medical care, housing, and the elderly. She resented the church's mandatory retirement policy and after being forced to retire began meeting with other retirees about social issues.

Kuhn and five other retirees founded the Consultation of Older and Younger Adults for Social Change in 1970, an organization committed to bridging the gap between young and old people. A reverend who likened them to the militant Black Panthers dubbed them the "Gray Panthers." The name was officially adopted in 1972. From their office in a Philadelphia church basement, they launched a crusade for nursing home reform, fought ageism and racism, and claimed that "old people constitute America's biggest untapped and undervalued human energy source."

In 1973, the Gray Panthers merged with Ralph Nader's Retired Professional Action Group and began healthcare advocacy for the elderly. Outgrowing their mid-Atlantic base, the Gray Panthers launched a national organization comprised of local "Networks," each of which had a leader known as a "Convenor." The group began investigating fraud in the health care industry and launched a study of nursing homes that resulted in *Nursing Homes: A Citizens' Action Guide* (1977). Beginning in the mid-1970s, the group presented position papers and staged protests at meetings of the American Medical Association (AMA) in an effort to get the AMA to focus on the medical concerns of the elderly. Kuhn later attacked welfare reform for its shortcomings, the negative portrayal of the elderly on television, and the Reagan administration for wanting to cut Social Security benefits. The Gray Panthers succeeded in raising or eliminating the mandatory retirement age in certain jobs. In the early 1990s, a campaign for a national healthcare system was their top priority. Kuhn remained the national convenor of the organization and received several honors for her work. She died at home in Philadelphia, Pennsylvania, on April 22, 1995. The organization briefly struggled to remain viable after her death, but reorganized and has remained vital since.

James G. Lewis

burdens of healthcare for the elderly, but it did nothing to help the aged to live with chronic diseases and disabilities, find home healthcare services, and get financial help with Medicare when personal funds ran out.

Maggie Kuhn, the driving force behind the Gray Panthers, however, did not hold that the overriding problem affecting the aged was health or money. She concurred with the findings of a 1969 Senate Special Subcommittee on Aging: Old people, it concluded, yearn for involvement. "They are crushed with the feeling of no longer being wanted, useful or important to others. They have been stripped of their value—and so of their dignity as human beings." Kuhn was determined to transform the long-held stereotype of the old as impoverished, frail, and politically impotent people. She eschewed the term *senior citizen* ("old people are old") and advocated the elderly's place at the table: "We'll do it with militancy, demonstrations, badges—anything." She encouraged older people to take control of their lives and to "speak out, even if your voice shakes," and regain a sense of social and political empowerment.

Diminutive, frail, white hair tied back in a wispy bun, granny glasses—Kuhn was a perfect fit for the little old lady every Boy Scout helps across the street. In action she was a dynamic leader, keenly aware of the profound influence TV and local media reports have on the public's view of a movement. She set the tone and shaped the fledgling movement's opposition to the political and economic status quo, clearly differentiating it from the establishment aging organizations, which, Kuhn charged, failed to encourage old people to take control of their lives as well as an activist role in society's larger issues.

Although 70 percent of the elderly impoverished

were women, and black elderly women were more likely to be poor and living in squalor than white, neither the AARP nor the NCSC addressed gender, race, or class inequities. An indication of AARP's base is discernible in its Medicare position: Rather than join a national campaign to mandate legislation that would limit doctor fees to Medicare levels, AARP urged members to join private health insurance groups. Its activities, Kuhn said, were dictated by a "we worked damned hard and we're going to get ours" attitude.

Organization and Activism

Initially a loosely organized group of seniors and college-aged youth (those retired along with those not yet caught up in careers), the Gray Panthers sought people of all ages to work together to achieve a more equal distribution of power and wealth. Panthers took to the streets wafting banners and picket signs protesting the Vietnam War, nursing home abuse, homelessness, and skyrocketing child-care costs. Radical protests by the elderly had not been seen in the United States since the 1930s when the Townsend Movement demonstrated for the enactment of a national pension system, a movement credited with being a factor in the passage of the Social Security Act of 1936.

Headquarters started out as a room in Kuhn's West Philadelphia home, a refurbished house that she shared with several young people. (Panthers advocated intergenerational home sharing as a solution to homelessness.) Although Maggie Kuhn was its most visible leader, she was far from autocratic. Throughout the country, local networks of Panthers and "cubs" (Panthers under thirty) acted independently of headquarters—in ideology and in organization the style was democratic—not authoritarian. It eschewed dues collection and membership cards, differentiating it from mainstream social action groups. With its small numbers and tiny budgets, the Panthers fought for everyone's place at the table.

National recognition exploded when the Panthers set its sights on the White House Conference on Aging (WHCA) in December 1971. Charging that the WHCA was a "whitewash" that ignored the nation's elderly African Americans, the Panthers, in league with the National Caucus on the Black Aged, staged a Black House Conference on Aging. At the time, African-American elderly suffered a disproportionate share of the problems of old age, essentially because the Social Security system was based on white mortality tables and many elderly blacks did not live long enough to receive benefits. Moreover, 50 percent of the black elderly population qualified as poor, with most black elderly men in 1969 bringing home annual incomes of less than $3,000. Reinforcing the rebellious mood was the WHCA's delegate apportionment—rural states held a majority voice rather than urban states where most of the U.S. elderly resided.

Held just two weeks before and a few blocks away from the White House Conference, the Black House Conference brought close to 1,000 people—mostly elderly blacks—together at the New York Avenue Presbyterian Church for the two-day meeting. With no funds for hotel rooms, many slept in the church. At the conference conclusion, attendees marched to the White House gates to present their demands: reduce disparities between blacks and whites in healthcare, housing, and income, and end the war. D.C. mounted police ordered the group to disperse. Fannie Jefferson, a march leader, refused. Whistles rang out. Horses charged. Kuhn was knocked to the ground. Jefferson was handcuffed, swept off in a police car, and charged with disorderly conduct. The melee made national headlines and prompted a reverend to dub the group the Gray Panthers (after the Black Panthers) on the way to taping a television program in New York City. The name stuck.

Meanwhile, back at the White House, WHCA organizers quickly shifted gears. Invitations went out for minority participation, Black House Conference issues were added to the agenda, and the speakers' roster was reconfigured to include academic gerontologists, gray lobbyists, reformers, and high-level Nixon administration bureaucrats. Kuhn was awarded press credentials, allowing her to file salty daily critiques of the proceedings. The final session featured President Richard Nixon, who called for a broad set of legislative proposals covering Medicare expansion, a 25 percent increase in Social Security benefits, establishment of federal standards for private pension systems, creation of a $100 million nutrition program for the elderly, and housing and transportation programs for the poor.

With the headlines came a surge in membership and national recognition, forcing some semblance of organization on the Panthers—although its lack of formal structure was a key attraction. By late 1971, a steering committee was in place, with Kuhn as convener, and business was now conducted from a converted janitor's closet in Philadelphia's Tabernacle Church with a staff of volunteer college students. In October, the first in a series of annual leadership

workshops met at Ghost Ranch, New Mexico. Heads of Panther networks from all over the country attended. Early funding came from the United Presbyterian Church, the United Church of Christ, and national labor organizations. An alliance (and a $25,000 cash contribution) with Ralph Nader's Retired Professional Action Group was the first of many partnerships the Panthers would form over the years. A Gray Panther Project Fund was incorporated to receive funds, and the Internal Revenue Service granted nonprofit status in 1974. The same year produced a seven-point article of agreement on governance, and by 1975 the Panthers had hosted its first national convention, when 400 delegates from thirty-three states came to Chicago to pass resolutions on mandatory retirement, healthcare, inflation, hunger, nursing home reform, housing, and other issues.

Early Initiatives

These early Panthers viewed the world as amenable to change. They espoused diverse social causes, and their tactics echoed the civil rights activism of the 1960s: nonviolent confrontations, street demonstrations, letters, petitions, and heavy media exposure. To protest cutbacks in Philadelphia's transit system, for example, protesters strewed their canes across transit tracks, and their wheelchair-bound colleagues lofted placards calling for service restorations, holding up local transit and attracting local news coverage. A bank in Fayetteville, North Carolina, was picketed from morning to night for refusing to permit old people to use their homes as collateral for loans. Los Angeles saw a tent city go up, a block from City Hall and the *Times* Building, as Panthers fought cutbacks in public housing. Boston's Gray Panthers secured a $15,000 grant to develop interdependent living projects for isolated people. In Omaha, Panthers organized to fight public utility rate hikes, and in Kansas City Gray Panthers successfully sued to eliminate a freeze on welfare funds.

On a national level, the Panthers leveled its sights on healthcare. Panthers demanded that Washington provide a decentralized national health service. The national debate on healthcare had been in full force since the 1950s when a number of programs to resolve problems afflicting the elderly culminated in the passage of Medicare in 1966. But Medicare was not enough. Doctors, the Gray Panthers charged, gave short shrift to the elderly, and few of the 20,000 medical school faculty specialized in geriatrics. Physician training focused on acute illnesses—chronic conditions of old age were ignored.

On April 10, 1984, hundreds of Gray Panthers and older Americans march in Boston to demand the repeal of mandatory retirement legislation. *(AP Wide World Photos)*

Doctors became the next national target. Gray Panthers organized an unlikely coalition of nurses, medical students, Sisters of Mercy, Brothers of the Poor, and doctors to protest at the American Medical Association's 123rd national convention at Chicago's posh Palmer House. Borrowing from the 1960s "Guerilla Theater," members put on a skit in the Palmer House lobby depicting efforts to revive a comatose AMA (a Panther dressed in a hospital gown labeled "Sick AMA"). The body was carried out to the curb where a Sisters of Mercy ambulance waited. A doctor–nurse team employed oxygen, mouth-to-mouth resuscitation, and deep chest massage. Nothing worked. Vital signs returned only after the "medics" pulled wads of money out of the body's chest cavity. A photograph of the "Sick AMA" hemorrhaging dollar bills made the *Chicago Tribune*, drawing national headlines; interest in the Gray Panthers exploded. By 1979, the group claimed 30,000 members in thirty-two states.

Changing Stereotype

The heyday of the Gray Panthers (mid-1970s to the 1990s) coincided with a decline in the liberal-dominated social policies and civil rights activism of the late 1960s and early 1970s and a gradual ascendancy of the New Right with its thrust for reduced social welfare expenditures, tax reductions for upper-income groups and corporations, less environmental regulation, and opposition to recent gains of minorities and women. American politics underwent a dramatic shift as right-wing conservatives reorganized to mount a campaign of persuasion to influence the popular culture. By the late 1970s, their work had begun to bear fruit as generously endowed conservative think-tanks like the Heritage Foundation and the American Enterprise Institute, centers of conservative political thought and writing, emerged. Corporate funding sponsored the airing of conservative projects such as Accuracy in Media, the *American Spectator*, and economist Milton Friedman's "Free to Choose" TV program. Among the issues singled out were federal expenditures on older Americans. Conservative analysts cited the high cost of Social Security, which rose some $60 billion in the decade from 1970; they decried as wasteful special tax exemptions and credits awarded the over-sixty-fives, charging that the entitlements had created an "Old Age Welfare State."

New stereotypes now emerged in the popular culture, portraying the elderly not as the feeble, frail, and impoverished, but rather as greedy guzzlers feeding at the public trough. Political efforts intensified to delegitimize the elderly as deserving recipients and to undermine public confidence in Social Security. The New Right, under President Ronald Reagan and guided by economist Arthur Laffer's supply-side theories advocating tax cuts and reductions in social spending as solutions to the nation's economic problems, made political hay with heavily weighted analyses of government expenditures on the old in comparison to other age groups. It strove to reframe the context within which Americans viewed the elderly. Newsmagazines recast old folks as "greedy geezers" and "savage grannies" whose powerful "geriatric juggernaut" in Washington shamelessly protected their extravagant legislative gains at the expense of the rest of American society. A *Forbes* cover asked, "America's Elderly: Can We afford Them?" One journal referred to Social Security as "the monster that's eating our future," while *Newsweek* termed Social Security the "trust fund that ate America."

With the groundwork laid, the Reagan administration opened its assault on Social Security in spring 1981, introducing legislation calling for reductions in benefits, stricter limits in disability criteria, and delays in implementing cost-of-living allowances. In response, the Gray Panthers mounted a huge letter-writing campaign and testified before House Ways and Means Committee hearings, leading Representative Dan Rostenkowski (D-IL) to liken the Panthers to paratroopers: "They can drop in on you at any time." Kuhn led the Panthers in candlelight vigils from a tent city erected across the street from the White House and staged public demonstrations around the country, culminating in a July 21, 1982, rally at the Capitol. Panthers railed against a "society that throws people away, that views old age as a disease, that says if you don't have a job you're nobody." If, Panthers argued, Social Security is scaled back or withdrawn, elderly poverty rates would increase hugely. Without Medicare, the burden of hospital and medical expenses would be overwhelming. Without a public pension to encourage older workers to retire, employment opportunities for younger workers would diminish. Without the economic independence that federal programs provided for older Americans, an enormous burden of support would fall on the shoulders of younger family members.

By relegitimizing Social Security in the public mind as an earned "right" ("this is their money. They had it deducted from their wages," Senator Howard Metzenbaum (D-OH) told *US News & World Report),* the Panthers and its allies formed an effective strategy to defuse the New Right's rhetorical ploys. The sheer magnitude of the organized political opposition, with the Gray Panthers playing a key role, forced the Reagan administration to settle for far less in Social Security cutbacks.

The *Nation* termed the Gray Panthers as "radically visionary" as they were activist. The movement never lost sight of the social issues that benefit all, insisting on its intergenerational focus. "We are not an old folks lobby and never have been," Kuhn told an interviewer in 1988. The Panthers refused to pit the interests of the old against those of the young. They lampooned the New Right's arguments of generational inequity, noting the naivete of its assumption of static generations—everyone ages. "We're all getting older," Kuhn mused.

The cross-generational nature of its membership helps distinguish the Panthers from the well-funded AARP. Over the years, local Gray Panther networks continued to organize demonstrations on tenants rights in nursing homes, against hearing aid industry

abuses (in alliance with Ralph Nader's Public Citizen, Inc.), intergenerational housing, and social justice. The movement is credited with new legislation governing the hearing aid industry and for the eventual ban on mandatory retirement. The Panthers persuaded the National Association of Broadcasters to amend the Television Code of Ethics to include age with race and sex as areas of media sensitivity. Maggie Kuhn appeared on Johnny Carson's *Tonight Show*, where she scolded the host for his "Aunt Blabby" portrayal, and she publicly chastised President Gerald Ford at a White House press conference for calling her a "young lady." "I'm an old woman," she told him.

The Gray Panthers catapulted into the national consciousness, growing to 100,000 members in forty-two states and a half dozen countries by the mid-1980s. Given its aversion to hierarchical organization (a Washington, D.C., office was not opened until 1981, and the number of national staff members never rose above six), the Gray Panthers has not been a consistent, organized Washington lobby group. Its significance lies in its activist role as among the most vocal of organizations calling for universal healthcare, economic justice for all, and the preservation of Social Security and Medicare programs. It worked within a recognized counter establishment that included Ralph Nader's Public Citizen, Inc., the National Organization of Women, Hospice International, Greenpeace, and the Union of Concerned Scientists. Targets included the AMA, the Gerontological Society of America, Congress, state legislatures, the United Nations, local zoning boards, courts, banks, and insurance companies. Spirited demonstrations and rallies called for public ownership and control of utilities, elimination of the income cap for Social Security benefits, nuclear disarmament, prison reform, and a national healthcare program. By the early 1980s, the Gray Panthers were publishing their own national newsletter, running radio programs in several cities, conducting a media watch to monitor press coverage of old people, and producing *Over Easy*, a public television program on social issues. In 1981, the Gray Panthers were awarded consultant status at the United Nations and opened an office in Washington, D.C.

Always overshadowed by the more centrist AARP, particularly after the death of the charismatic Maggie Kuhn in 1995 (the movement by then had dwindled to less than 40,000 members in 100 local networks), the Gray Panthers still hold some sway in the political debate, particularly on the local level. Social scientist Robert Binstock notes that the Gray Panthers is the only "organization working to solve the problems of human beings rather than those of the profession and the industry" and remains one of the few activist groups to have survived the Vietnam War. Others theorize that the Gray Panthers was perhaps most effective in raising the nation's consciousness about ageism and the problems of the elderly. It drew national attention to the needs of the elderly and succeeded in creating a new public image of the old as a community of vital, involved people who provide a radical conscience for society. Its biennial conventions still feature public displays on the plight of the uninsured, the homeless, and other disenfranchised members of society.

Senior Citizens Movement

The social movement on behalf of older people in the United States reflects their growing numbers. Increased longevity, better medical care, and a decline in infectious diseases significantly changed the demographic composition of the nation's population in the twentieth century. Before 1900, people over the age of sixty represented less than 2 percent of the populace; by mid-century, that proportion had grown to 7.8 percent. The 2000 census revealed that 16.2 percent, or 45 million people, were sixty years of age or older. The "baby boom" generation (those born between 1946 and 1964) is expected to double the elderly population by the year 2010.

The terms *old age*, *aging*, and *elderly* have many different contextual meanings that have evolved over time. From Roman times when Cicero first wrote "aging is itself a disease" through the nineteenth century, physicians used a medical definition for old age. Unable to discriminate between physiological changes like graying hair and the characteristic symptoms of chronic illnesses like arthritis, they concluded that old age was a disease for which there was no treatment or cure. Chronological age has also been used as a social or cultural device to frame expectations and control behavior. The onset of old age has been set at various points between forty-five and seventy years. Most recently, the terms "young-old" (65 to 85 years) and "old-old" (85 plus) suggest that elderly people continue to be segregated into age-based categories. Some researchers and practitioners employ other parameters, however. A functional definition of old age considers not age per se, but the ability to perform normal daily activities and be self-sufficient. A biological approach addresses aging on the cellular level and studies the role of genetics. For most people, there are two kinds of aging: the preferred "normal" old age in which the individual is healthy and independent, and pathological old age characterized by dependence and deterioration of physical or mental functions.

The Aged and Poverty

The tradition of community responsibility and public assistance for the needy originates in the English "Old" Poor Laws. Beginning in 1531, a series of laws in Great Britain repressed vagrancy and begging but gave the aged poor special license to ask for alms. The law later mandated the local collection and distribution of charitable alms. By 1601, the Poor Relief Act required each parish to levy a tax on its citizens to provide relief for dependent people, specifically orphans and widows, the sick, elderly, and disabled. Without state guidelines for the local administration of or fiscal responsibility for public charity, arbitrary and discriminatory poor relief practices provided minimal assistance.

Settlers in the American colonies continued this tradition of local responsibility for dependents in the community. Poor relief fell under the jurisdiction of public charity but was implemented under the rubric of private religious beliefs. Older people without family support received assistance in their homes, while others were cared for in the homes of neighbors. Relief assistance was limited, personal, and community based.

In the early decades of the nineteenth century, the democratic ideology of independence began to influence the administration and distribution of charity in the United States. The general public viewed pauperism as a consequence of poor habits, bad morals, or intemperance, and paupers as inferior. In large cities, public almshouses provided food and shelter in a controlled and often punitive environment that sought to reform intractable behavior and inculcate a proper work ethic. The concept of minimum sufficiency, institutionalized as "indoor" relief, presumably deterred slackers and the able bodied but reinforced categorical

separations between the worthy and unworthy poor. In rural areas, township officials or county commissioners directed poor relief efforts by taxing the local community and providing "outdoor" relief such as food or firewood. Eventually, county administrators constructed "poor houses," which were usually located on working farms that mirrored the conservative and cash-starved ideology of rural life.

The Inadequacy of Private Charity

For the old, sick, and infirm who required long-term custodial care, the institutional constraints designed for the poor were clearly inappropriate. Almshouses and poor farms housed undifferentiated populations that included children and families, elderly, sick, deaf, blind, and mentally incompetent people. By the mid- to late nineteenth century, professional social scientists abandoned outdoor relief, believing that it fostered dependency, and so began to focus on prevention and treatment instead. Reform efforts on behalf of special groups resulted in new institutions that segregated the dependent poor according to age or need. With new asylums for the mentally ill, orphanages, and special schools for the blind and deaf being built, greater numbers of elderly took refuge in almshouses and county poor farms. In the interests of "scientific charity," the charity organization movement and state departments of charities and corrections endorsed better standards, equitable treatment, and efficient operations in public institutions, but local administration and meager funding for deteriorating facilities mitigated against good service for the elderly. Because old age could not be prevented or treated, old people in public institutions became "invisible." Despite the fact that less than 5 percent of the elderly have ever populated institutions, the poor house came to symbolize moral, social, and economic failure, a place inhabited by people whose age, health, social status, and seemingly insignificant numbers precluded any widespread national reform movement.

After the Civil War, religious institutions and private, charitable organizations began operating old age homes that catered to the needs of the "worthy" poor—those who through no fault of their own needed assistance. The Little Sisters of the Poor, a Catholic religious order that opened thirteen homes across the country for the elderly between 1868 and 1872, accepted anyone who was destitute, over sixty, and of good character, regardless of race or religion. More commonly, old age homes closely restricted admissions. Some accepted white, Anglo-Saxon Protestant women or those of a specific ethnicity; others admitted only those old people who were free from chronic disease. Women often played a central role in ascertaining the need for and spearheading support for private, church-related homes. The disparaging "lady bountiful" image belies the important role that nineteenth-century women played in community reform and charitable service. Denominational groups such as the Baptists, Episcopalians, and Presbyterians, as well as church women of the African-American community, opened small homes for the aged that often cared for fewer than twenty people. Other ethnic groups like the Germans, Scots, and Welsh as well as Jewish benevolent societies and fraternal organizations (such as the Freemasons, Odd Fellows, and Fraternal Order of Eagles) created institutions for their older people. Advocates sustained these benevolent efforts through personal networks and private appeals for funds.

These efforts had a minimal impact on the aged. As charity workers and reformers began to work in the community, they recognized not only the inequity of private philanthropic relief and the inadequacy of public provisions but also the injustice of blaming individuals for their situation. After the 1880s, Protestant clergy stressed good works through social reform in a movement known as the "Social Gospel." Rev. Harris R. Cooley, the director of Charities and Corrections in Cleveland, Ohio, from 1901 to 1912, developed an internationally recognized municipal facility for health and elder care. The municipal model, grounded in Christian morality and financed with public funds, was one attempt to mitigate the negative perceptions about public institutions and to remedy the gap between public and private charity. Municipal and charitable hospitals also provided shelter for homeless people suffering with debilitating disease. Lacking public support and denied entrance into private institutions, some destitute and homeless elders turned to charity wards of city hospitals as their last resort. As hospitals became more scientific and catered to acute medical needs, however, this option became less available.

An exception to these local, private efforts were institutions supported by the federal government that provided hospice and medical care for old soldiers and those disabled in battle. The U.S. Naval Home, chartered in 1811 and opened in 1834 in Philadelphia, Pennsylvania, provided "permanent asylum for decrepit and disabled naval officers, seamen, and Marines." The U.S. Soldiers Home in Washington, D.C., opened in 1851 as an asylum for old and disabled veterans. Monthly payroll deductions of active duty enlistees were placed into pension or permanent trust funds and used to operate both homes. The Marine Hospital Service established by Congress in 1798 provided temporary relief to sick and disabled seamen and was the predecessor of the U.S. Public Health Service.

Post–Civil War Government Efforts

After the Civil War, legislation at the state level authorized the construction and operation of old soldiers' homes and resulted in more than thirty-six facilities in the North and fourteen in the South. The three National Homes for Disabled Volunteer Soldiers in Maine, Ohio, and Wisconsin provided veterans with a place to live and the promise of rehabilitation for eventual employment. In 1898, over 5,000 aging veterans, 64 percent of whom were not U.S. born, lived at the Dayton, Ohio, residential complex.

The federal government played a crucial role in the promise and provision of care for services rendered by veterans. The Continental Congress offered military pensions as an enlistment incentive. After the Revolutionary War, some soldiers received small stipends or land grants as partial payment for their military service. In 1818, Congress approved a general service pension for soldiers. By the following year, more than 28,000 veterans had applied for benefits. Although meager and quite restricted, the pensions nevertheless linked military service with remuneration at a later stage of life and established a precedent for federal participation.

In 1862, Congress set up a full-scale pension program for veterans suffering from war-related injuries. Provisions added in 1884 expanded eligibility to all veterans who were disabled by age or disease and unable to work. As the century came to a close, need and service-related disability were eliminated as prerequisites for benefits. By the early part of the twentieth century, chronological age was the single determinant used by the pension bureau.

Industrial development in the United States coincided with increased immigration and growth in the population, urbanization, and workplace specialization. Living conditions in overcrowded cities and the work environment in unregulated industries and manufacturing plants drew the attention of reformers who believed wage earners to be particularly vulnerable. Anti-aging rhetoric asserted that older people were not as efficient or as productive as younger workers and that modern technology used up the energy reserves of workers. Superannuation, decreased pay, and forced retirement policies controlled unemployment and shortened the overall work life of wage earners. Social theorists concluded that the shift from an agrarian to an industrial economy and the demographic relocation from rural to urban areas had disrupted the economic strategies (such as family support, wage labor, savings) traditionally used by older people. Advocates and welfare workers shifted the blame for dependency (poverty) from individual shortcomings to the broader economic system. Many began to promote a national plan for old age benefits.

Others distrusted federal intervention and believed that the notion of welfare capitalism would result in voluntary benefit programs. Between 1875 and 1900 trade unions, the railroads, a few private corporations, and industries like metal fabrication and mining that were particularly dangerous for workers experimented with death, disability, and retirement benefit systems. By 1908, nearly 500 private funds existed across the country. Most plans stipulated that an employee have a minimum number of years of service (twenty or thirty) and be incapacitated after a specific age (sixty or sixty-five). Underfunded and ineffective company-sponsored plans covered relatively few workers.

Support for retirement plans were not limited to industry. Efforts on behalf of teachers also resulted in some rudimentary pension programs. At the time of the city's consolidation in 1894, New York adopted a retirement system for its teachers. New Jersey enacted similar legislation for educators in 1896. In 1905, the Carnegie Foundation set up a $10 million retirement fund in order to provide pensions for college professors. This led to the creation of the Teachers Insurance and Assurity Association in 1918.

Federal, state, and local governments also implemented retirement programs for civic workers during the first decades of the twentieth century. Massachusetts was the first state to develop a contributory pension plan for all state employees in 1911. Between 1910 and 1920, the federal government implemented mandatory retirement at age seventy, inaugurated a compulsory savings plan, and brought classified civil service workers into the government pension plan. Municipal retirement programs for police and firefighters were widespread by the late 1920s.

It proved difficult to garner support for old age assistance programs at the state level. The private sector feared state intervention, opposed higher taxes, and believed that public pensions compromised the very nature of the private, voluntary, and mutual aid societies that had been the hallmark of the nation's charity system. Some people claimed that a public welfare system was un-American, whereas others believed that state support of the elderly would lead to a breakdown in family ties and discourage workers from saving. Although several state commissions recommended unrestricted pensions for elders, this counsel went unheeded. Early attempts to legislate assistance did not pass in Massachusetts (1903), and similar laws were declared unconstitutional in Arizona (1916) and Pennsylvania (1924).

Government Social Support

Nonetheless, old age assistance became an important rallying point for advocates. Support for state old age pensions gained momentum when interest groups argued that public categorical assistance programs for needy mothers and pensions for the blind and the military were already in place. Following Montana's lead in 1923, thirty-five states enacted state-supported assistance programs for indigent elders who lacked family support. In 1935, the average daily benefit paid to the elderly was 65 cents. Only a small minority of older Americans (3 percent) received any old age assistance. Public debate continued around the issues of need (means testing), use of government resources for public charity for the elderly, and whether social insurance should be voluntary or compulsory.

Although retirement benefits and old age assistance were at the forefront of the aging movement, interest in the elderly went beyond financial issues. In 1903, the American physician and future Nobel Prize winner Elie Metchnikoff coined the term *gerontology* and targeted old age and death as new areas for research. Ignatz L. Nascher, M.D., proposed in 1909 that fellow physicians study the medical aspects of old age in a new specialty that he called "geriatrics." Although neither of these subjects immediately ignited any interest as research topics, the designation of age-specific terms marked the beginning of a new period in the history of aging. Public awareness surfaced in other ways. In Cleveland, Ohio, Benjamin Rose estab-

lished the first nonprofit organization to exclusively address the needs of the elderly in 1908. Massachusetts established a public commission on aging in 1909, followed by studies conducted in Pennsylvania, Ohio, and New York. The American Association for Labor Legislation created a social insurance committee in 1912.

Two advocates of social insurance helped launch a pro–old age reform agenda. Isaac M. Rubinow, a Russian immigrant who held both an M.D. and a Ph.D. in economics, believed that a national plan fully supported by taxes could prevent destitution and obviate the need for relief. He argued that those most in need, women, the elderly, and the disabled, were the ones least able to afford private insurance. Rubinow supported a compulsory national benefit plan and social justice for workers. His ideas influenced the work of the Committee on Economic Security as it hammered out a national old age pension and unemployment plan.

The Emergence of Old Age Assistance

Abraham Epstein directed the Pennsylvania Commission on Old Age Pensions in 1920 and worked for the commission until 1927 when he formed the American Association for Old Age Assistance (later the American Association for Social Security [1933]) to promote a national program for old age benefits. Epstein supported an old age insurance plan based on work history and funded by fixed contributions from the employer and the employee. This contributory feature, he believed, would help separate the concept of old age pension from the negative old age assistance programs associated with need and pauperism. Under Epstein's direction in the mid-1920s, local chapters of the Fraternal Order of Eagles formed useful coalitions with state federations of labor and successfully exerted grassroots pressure for legislative change.

Grassroots movements that advocated social justice and supplemental income continued to proliferate during the Great Depression. Based in Michigan, Father Charles E. Coughlin reached a national radio audience estimated at more than 35 million to galvanize support for his National Union for Social Justice. Huey Long, a ruthless and canny politician from Louisiana, introduced the immensely popular Share Our Wealth plan that urged the government to provide every American family with an annual guaranteed income of $5,000 and a pension for all people over age sixty. The movement claimed to have more than 27,000 clubs in every state with 7.7 million members before Long was assassinated in 1935. Other smaller movements appealed to people on the basis of age and financial need. Upton Sinclair's End Poverty in California (EPIC) plan recommended a $50 a month pension for needy Californians over sixty who had been residents for at least three years. Robert Noble's Ham and Eggs plan attracted 300,000 members with its proposal that the state of California issue scrip worth $30 every week to unemployed.

The Townsend plan addressed both economic recovery and social reform. Put forward by California physician Francis E. Townsend, it proposed that the federal government give everyone over sixty years of age a $200 monthly allowance but stipulated that the entire amount must be spent every month. Funded by a 2 percent sales tax, Townsend believed the plan would encourage spending and help older people. By 1935, 2.2 million members in 7,000 Townsend Clubs supported a national old age pension plan. Public approval reached 56 percent when Townsend groups bombarded Congress with 10 million postcards. Although short-lived and not fully developed, the Townsend plan and other grassroots movements demonstrated the willingness of the American public to put aside views on individualism and minimum intervention from the state in favor of a national social welfare system.

In 1934, in the midst of a national economic depression, President Franklin D. Roosevelt set up a cabinet-level Committee on Economic Security under Secretary of Labor Frances Perkins. Edwin E. Witte served as the executive director along with an advisory committee of twenty-three. The committee at first considered unemployment, old age security, and healthcare but later dropped healthcare from its agenda. With the passage of the Social Security Act of 1935, welfare funding moved from the disparate local, voluntary efforts to a federal, publicly funded system. Part of the sweeping reform movements of Roosevelt's New Deal, Old Age, Survivors, and Disability Insurance (OASDI), generically referred to as Social Security, set up a national contributory plan for old age insurance benefits. The compromise plan replaced the needs-based and charity components of Old Age Assistance with a categorical, income-based insurance or annuity system. The plan was implemented on January 1, 1937, and industrial and commercial workers paid 2 percent of their wages (up to $3,000) into an Old Age and Survivors Insurance Trust Fund. Employers matched these contributions. Later amendments to the Social Security Administration (SSA)

increased benefits and extended coverage to agricultural and domestic workers, the self-employed, employees of nonprofits, and those not in federal retirement programs. The SSA established the national identification system of Social Security numbers that insure contributions from every wage earner in the United States. The first federal old age benefits were paid to Ida M. Fuller, a former teacher and legal secretary from Ludlow, Vermont, in January 1940. She collected benefits until her death in 1975.

Philanthropy

Philanthropic organizations also spearheaded reform and blurred the boundaries between public and private efforts. In 1937, the Josiah Macy Jr. Foundation funded the first national conference on aging, resulting in the landmark publication of E.V. Cowdry's *Problems of Ageing* (1939). In 1940, the Macy Foundation awarded a one-year grant to support a partnership between the National Institutes of Health (NIH) and the city of Baltimore. This program evolved into a more comprehensive research program under Nathan W. Shock, who was appointed chief of the Gerontology Unit at the NIH in 1941.

Organizational advocacy for the elderly emerged in the context of science and research. In 1942, a core group of physicians, including Ignatz L. Nascher and Malford W. Thewlis, formed the American Geriatrics Society. This national organization for physicians helped focus attention on the medical and biological aspects of aging and promoted research and education in geriatric medicine. The Gerontological Society was organized in 1946 to establish gerontology as a field of study. It soon attracted a wide range of practitioners and professionals, including social workers, caregivers, nursing home operators, and researchers. Members advocated a multidisciplinary approach to the care and study of older people. The emergence of these two professional organizations signaled a change in how professionals perceived old people. Old age was seen no longer as an incurable disease but rather as a challenging, natural stage of life.

Rise of Member Advocacy Organizations

Other aging interest groups emerged after World War II. They included the National Retired Teachers Association (1947), the National Council on Aging (1950), and the American Association of Retired People (1958). Founded by Ethel Percy Andrus, the National Retired Teachers Association (NRTA) supported improved pension benefits and established a national group health insurance program in 1955. When other retirees tried to enroll in the program, Andrus founded the American Association of Retired People (AARP), a more inclusive association for older people with service, educational, and advocacy functions. In 1982, NRTA became a subsidiary association of the, by then, much larger AARP. In 1983, AARP lowered membership eligibility requirements from fifty-five to fifty years of age. In 2002, the organization had slightly more than 35 million members (about 44 percent of the over-fifty population in the United States), making it the largest membership group for old age advocacy. Thirty-seven hundred local chapters offer community service programs such as income tax preparation and counseling, take advocacy positions on healthcare, housing, and long-term care, and provide critical support for legislative initiatives such as the Age Discrimination in Employment Act of 1967 and the 1986 amendment that eliminated mandatory

On April 16, 2002, Merle Senft (front) and Wenifred Statler (back left) join a rally in Harrisburg, Pennsylvania, to urge expansion of the state's prescription drug program. The AARP, formerly known as the American Association of Retired People, has become a powerful lobbying organization on behalf of Americans fifty years of age and older. *(AP Wide World Photos)*

retirement. The National Council on Aging was organized under the aegis of the National Social Welfare Assembly in 1950. Led by Ollie Randall and Geneva Mathiasen, the organization promotes awareness and dialogue about the needs of the elderly, emphasizing social services. By the early twenty-first century, it had expanded its agenda to include intergenerational issues. Its membership includes seniors, voluntary agencies and associations.

These groups signaled a burgeoning social movement that accelerated in the 1960s. A vast network of public and private organizations, professional and institutional groups, trade associations, and nonprofits created an effective "gray lobby." New organizations such as the National Council of Senior Citizens under Aime Forand (1961), Gray Panthers Project Fund founded by Maggie Kuhn (1970), and the Older Women's League (1980) founded by Tish Sommers and Laurie Shields agitated for political reform. By 1970, there was an eightfold increase in the number of aging interest groups. Today innumerable grassroots organizations and affiliate groups specifically address issues related to older people and aging.

Continued Federal Role

After World War II, the nation turned its attention to domestic issues. In 1950, the Federal Security Administration sponsored a national conference on aging called "Man and His Years" to promote awareness and assess the challenges of an aging population. Eight hundred delegates made recommendations that became the guidelines for a broadly conceived national action plan. The conference sparked interest in old age and was the forerunner of subsequent White House Conferences on Aging held in 1961, 1971, 1981, and 1995. By 1960, there were nearly 16.7 million Americans over sixty-five. Poverty and aging came to the forefront as social commentators pointed out glaring economic disparities in access to services and technology. Some began to see age bias in the same context as racial and gender stereotyping.

In 1958, the White House Conference on Aging Act (PL 85-908) authorized the conference and funded public forums in the two-year period preceding the conference. The first White House Conference on Aging (WHCoA) in 1961 brought more than 3,000 delegates and attendees to Washington, D.C. Representatives from over 300 national voluntary organizations and special interest groups like AARP and NCSA participated. These special interest groups became more vocal, and with increasingly sophisticated political savvy, campaigned for national health insurance. The passage of Medicare and Medicaid (Titles XVIII and XIX of the Social Security Act) in 1965 directly resulted from the conference. The Older Americans Act enacted the same year authorized the creation of the Federal Administration on Aging and the Area Agencies on Aging. Its broad scope included healthcare and nutritional programs, housing, legal, educational, and recreational initiatives specifically aimed at older Americans. The Age Discrimination in Employment Act (1967) prohibited discrimination against workers older than forty years.

The 1971 WHCoA encouraged special interest groups to participate and made a stronger effort to coordinate community, regional, and state forums with the national conference. It focused on income maintenance and drafted nearly 200 recommendations. Increased public awareness and advocacy for older Americans resulted in bipartisan legislative efforts that brought a 20 percent increase and an indexed cost of living plan to Social Security benefits, as well as a Supplemental Security Income (SSI) program for needy elders, and a national nutrition program for seniors (nutrition sites, Meals on Wheels). In subsequent years, Congress authorized the Federal Council on Aging and the National Institute on Aging, established the House and Senate committees on aging, and passed the Employee Retirement Income Security Act (1974). Representative Claude Pepper emerged as a leader in elder advocacy. As an original member and later chair of the House committee, Pepper directed hearings on nursing home fraud, elder abuse, healthcare reform, and Alzheimer's disease. At the state level, Area Agencies on Aging identified needs and worked to coordinate services and improve access to transportation for older Americans.

The WHCoA in 1981 employed the same planning model used in the earlier conferences. Older people and activists participated in more than 9,500 local and state forums held in the two-year period immediately preceding the conference. Many advocacy groups took the opportunity to sponsor mini-conferences on topics such as arts, humanities, mental health, recreation, and leisure. Deliberately more inclusive, this conference garnered greater participation by women, minority groups, and the disabled. Attended by 3,100 delegates and observers, the gathering resulted in new attention to elder abuse, long-term healthcare, ageism, adult education, and intergenerational programming. It produced a record number of recommendations (668) for legislative and administration attention. Reforms of the 1980s included protection of

nursing home residents, stricter inspection standards, and the adoption of patients' bill of rights.

The 1995 WHCoA proclaimed "America Now and into the 21st Century: Generations Aging Together with Independence, Opportunity and Dignity" as its theme. The conference proposed few new initiatives but focused on the review, reauthorization, and preservation of existing programs. Once again, local- and state-level forums encouraged broad participation and helped shape an agenda that included health and long-term care issues, economic security, social services, and quality of life.

Early in the twentieth century, reformers used the deplorable conditions in public institutions to focus attention on housing needs. A U.S. Bureau of Labor survey in 1925 concluded that American almshouses were "dilapidated, inadequate and indecent." Title I of the SSA prohibited payment of benefits to those residing in public institutions. This brought growth in the private sector as owners of boarding houses turned their homes into informal domiciliary facilities. Lacking safety, fire, or care standards, the facilities subjected older residents to abuse and corruption.

In the twentieth century, the term *nursing home* was a generic term for any facility that provided care for older people. Some "normal" (disease-free) seniors lived in private nursing homes or residences that did not offer any medical services. Other elders resided in "chronic" hospitals that provided long-term, permanent residency for people with a wide range of disabilities. Public facilities, private board and care homes, and rest homes offered a variety of alternatives for residential care.

The Hill-Burton Act (1946) funded the construction of rural community hospitals. Later amendments in 1954 and 1957 included funding for long-term and ambulatory care facilities. This fostered the growth of proprietary nursing homes built on a medical model and led to the growth of the nursing home industry as a commercial, rather than public, private, or charitable, venture. The enactment of Medicare and Medicaid brought an explosive growth of nursing home beds but did not necessarily ensure quality institutional care for older people. As Robert Butler, the first director of the National Institute on Aging, noted in his Pulitzer Prize–winning book, *Why Survive? Being Old in America* (1975), nursing homes often had no nurses and were not homes. Subsequent federal and state legislation developed standards that required operational certification. The following decades saw greater differentiation of the institutionalized elderly, including skilled nursing, intermediate, maintenance, and rehabilitation facilities that emphasize the welfare and medical functions from which they evolved. Emerging dementia care units and wellness models stressed function, independence, and life continuities in an effort to meet the needs of special populations of institutionalized elderly.

The New Aged in America

As people lived longer and spent a greater number of years as retirees, new living arrangements and leisure activities industries emerged. Astute real estate developers appealed to older people seeking milder climates and a lower cost of living by building senior housing developments. Age-segregated, and in some cases age-restricted, retirement communities like Sun City, Arizona, began to spring up in the 1950s. Northern "snowbirds," retirees who migrated south during the winter months as well as large numbers of older people who permanently relocated to the South, significantly changed the politics, economics, and culture of their new localities. In the twenty-first century, some retirees "age in place," choosing to live independently in familiar surroundings and to utilize elder services that are now almost universally accessible. Others select retirement homes that have the option for outside assistance and at-home services as needed. A late-twentieth-century development in housing offered elders a "continuum of care," a system that includes independent apartment living, assisted living, and nursing home care. Within the senior housing and healthcare system, assisted living was the fastest-growing sector in the early 2000s.

Housing, healthcare, and financial security represent the "three-legged stool" of reform efforts on behalf of older people. Throughout the twentieth century, the hard work and social vision of individuals, grassroots organizations, and private interests aroused public attention and resulted in a national pension plan for wage earners, assistance plans for needy older Americans, a health plan, and a variety of approaches to specialized housing. The Savings Are Vital to Everyone's Retirement Act (known as the SAVER Act of 1997), which calls for three national summits on retirement savings, suggests that financial support during retirement remains a national concern. The demographic composition of the American population and the support of broad, grassroots organizations will undoubtedly bring continued advocacy for important issues for older people, including prescription drug coverage, extension of long-term-care benefits under Medicare/Medicaid, and demands for

continued research into the aging processes and diseases associated with old age.

Disabilities Movement

The study of disability in America focuses on the concept of marginalized groups, the concept of social constructivism, as well as the relationship between the meaning and identity of the human body. The concept of social constructivism, developed by psychologist Lev Vygotsky in the 1930s, centers around the critical importance of culture and the necessity of understanding the social context for cognitive development, two concepts essential to the understanding of disability. The concept of disability concerns those underrepresented populations, which historically have included not only those with physical, emotional, or behavioral disabilities, but also the indigent and poor. It was not until the twentieth century that individuals with disabilities began to receive governmental acknowledgment other than government-sponsored rehabilitative homes or poorhouses.

With the advent of the 1973 American Rehabilitation Act and the 1990 Americans with Disabilities Act (ADA), the acknowledgment that disability existed in America gained national attention. The concept of disability, however, originated with the Thirteen Colonies and has been defined and redefined over the centuries. The twentieth century brought about a change in terminology from terms such as "deaf and dumb" or "handicapped" to terms such as "visually or hearing impaired" or "individuals with disabilities." The disability movement has essentially switched from a history that emphasizes a medical component to one that focuses on the minority in the study of disability. The concept of disability is one that must be analyzed in the spectrum of gender, race, ethnicity, and class, and the disability rights movement parallels the women's rights and civil rights movements, often encompassing both.

Defining Disability

The concept of disability originally focused on the inability to become a functioning part of society. Individuals with disabilities were unable to become true members of society; as Frank Bowe wrote in his "An Overview Paper on Civil Rights Issues of Handicapped Americans," "Disabled individuals were prohibited from settling in towns and villages of our Thirteen Colonies unless they could demonstrate ability to support themselves independently. . . . Immigration policy effectively forbade entrance into the country of persons with physical, mental, or emotional disabilities." Disability was often seen as "inability," so those who were disabled could not function as true members of society. As a result, those families whose membership included someone with a disability often kept these individuals hidden. Other families would either disown the individual, or neglect him or her, leaving that person to die without proper care. Bowe further noted, "Within disabled individuals, self-perception inevitably reflected prevailing social attitudes, keeping people from even attempting to become self-reliant."

The concept of "hiding" disabled individuals at home continued into the nineteenth century (and beyond as well). Those with disabilities were still considered insults to the family, but practices differed from area to area. Each community attempted to deal with the situation as best as possible; an 1849 Wisconsin law, delegated to "relieve and support all poor and indigent persons, lawfully settled therein, whenever they shall stand in need thereof," reflected similar laws in communities across the United States. The initial social policy in the nineteenth century appeared halfway through the century, mainly as a result of the industrial revolution, and the drive for all individuals to attain the minimal education level, approximately the equivalent of today's third-grade education. Those individuals who could not attain this level were perceived as "feeble-minded," and this included a range of disabilities, not just mental disabilities, but also visual, auditory, physical, or speech impairments, any-

thing that would limit socialization. This concept of inference, in which any disability, regardless of the type, resulted in a typecast of mental inferiority, began during social legislation in this period but remains strong today as well.

Initial Private and Government Efforts to Defend the Disabled

Perhaps the earliest proponent of efforts to aid the disabled was Dr. Samuel Gridley Howe, whose work in Boston, Massachusetts, made him a visible supporter of the "feeble-minded." In 1846, he became the head of a new commission that planned to study the "feebleminded" and recommend a policy to assist these individuals. His recommendations resulted in the creation of the Massachusetts School for Idiotic Children and Youth in Boston in 1849, which fostered a rehabilitative approach. The child sent to this school would learn to be "temperate and industrious" and become "better and happier," eventually resulting in the return of the child to his or her family as a better citizen.

This concept resulted in initial success, but it soon became apparent that the parents did not want to resume care of their children; these parents assumed their children were in better care under Howe's staff at the school, a concept that blatantly contradicted Howe's public disregard for institutionalization. He retired in 1874 as the head of the school, vehemently denouncing the segregation of those with disabilities; however, he would be one of the last dissenters until the early twentieth century. Howe did, however, succeed in creating the foundation for understanding the dehumanization of the institutionalized.

Howe's work no doubt also influenced the development of the first nationwide disability income support system, which appeared in the form of pensions for Civil War veterans. The 1862 law essentially provided a level of payment that was consistent with the individual's military rank and type of disability, which, in time, would expand to cover benefits for dependent widows, mothers, and fathers. This first large-scale federal welfare system received some additional support in 1879 with the passage of the Arrears of Pension Act, which entitled a person to all payments he might have received had a claim been filed at the time of the injury.

This resulted in a flood of pension requests; by 1880, veterans' pensions accounted for 20 percent of the federal budget and almost 30 percent by the turn of the century. The 1890 Dependent Pension Act practically legitimized any claim by a Civil War veteran, transposing this disability program into a social welfare program for the aged and leading to criticism for awarding pensions for work-related disability and veterans. Civil service reformers, in particular, were angered by the congressional approach to the administration of veterans' pensions, as well as the handling of work-related accidents. Workers complained about systems that required them to pay large sums of money to attorneys, interpreters, and witnesses, as well as to the doctors. Therefore, between 1911 and 1920, forty-five states passed worker's compensation laws that resulted in a new form of income for work-related disabilities.

Yet, over time, the types of disability would change, and the policies associated with worker's compensation did not, at least until the Social Security Act of 1935 became the legislative initiative for a national disability income support law. Although disability was an indirect component of the legislation, initially calling for support for the elderly and dependent children, a third category was added. During the congressional deliberations for passage of this legislation, a group of visually impaired individuals entered the hearing with their guide dogs, thus providing public acknowledgment of the visually impaired. The states could now offer welfare to visually impaired individuals, but only this category of disability received specific representation. States that wished to financially support individuals with various other disabilities would have to rely on state funding, not federally supported funds.

Intellectual Attitudes: Aversion and Support for Eugenics

Concurrent with the legislative and political trends were the societal perceptions, often fostered publicly in published works. Havelock Ellis, a leader for human rights and author of the book *The Task of Social Hygiene*, published in the United States in 1927, publicly supported women's rights, as well as the rights of the disadvantaged. However, he contradicted his public stance in passages on the "problem of feebleminded ness." He wrote that the "feebleminded" are "not adequately capable of resisting their own impulses or the solicitations of others, and they are unable to understand adequately the motives which guide the conduct of ordinary people." Viewing them as a burden to society and a menace to the future of American society since they formed "the reservoir from which the predatory classes are recruited," Ellis represented the contradiction between the public and private conceptions of disability which were so com-

mon to American life. He argued that "feeble-mindedness is an absolute dead-weight on the race," and the "very existence [of those with disabilities] is itself an impediment." The residential schools advocated earlier in the mid-nineteenth century by Howe had become something along the lines of custodial warehouses, leading to an advocacy of an early form of eugenics. In *Feeble-mindedness: Its Causes and Consequences* (1914), H.H. Goddard, the director of the Research Laboratory of the Training School in Vineland, New Jersey, argued that "the feeble-minded person is not desirable; he is a social encumbrance, often a burden to himself. In short it were better both for him and for society had he never been born. Should we not then, in our attempt to improve the race, begin by preventing the birth of more feeble-minded?"

This advocacy of sterilization became common during the early to mid-twentieth century. Havelock Ellis, despite his harsh words, only advocated involuntary "sterilization" of those with disabilities. Others, however, would go much farther, arguing that no "feebleminded person" should be allowed to marry or give birth, and that "certain families should become extinct." The idea that sterilization would resolve the indigency of the feebleminded grew throughout the early twentieth century.

In 1922, Harry Laughlin, a leading proponent of eugenics, created a model sterilization law that would require sterilization of the feebleminded, the insane, the delinquent, the "diseased" (including those with tuberculosis or leprosy), the deaf, the crippled, and all dependents, such as orphans. Similarly, a 1911 New York City ordinance warned that "No person who is diseased, maimed, mutilated, or in any way deformed is to be an unsightly or disgusting object or improper person to be allowed in or on the public ways or other public places in this city, shall therein or thereon expose himself to public view." By 1938, thirty-three states had adopted a sterilization law based on Laughlin's model, and between 1921 and 1964, over 63,000 individuals were sterilized involuntarily for "genetically related reasons." Although the sterilization policies were challenged in court, the challengers rarely won. A 1927 case in Virginia, *Buck vs. Bell*, is a prime example. The U.S. Supreme Court upheld the sterilization policy, arguing that sterilization was a necessity. Although the law in Virginia was repealed in 1968, sterilizations in Virginia continued until 1972, when twenty-six states still had a sterilization law on the books. Even in the twenty-first century, sterilization cases still appear before state courts.

Public Attitudes on the Disabled

The public perception of disability and the concept of disguising disability even went so far as to affect elected officials. For example, President Franklin D. Roosevelt, crippled by polio, was seen as an individual who was a "cured cripple"; the general public preferred to avoid seeing him as impaired. On only two occasions during his two terms in office did Roosevelt allow the public to see evidence of his disability, namely, at the dedication of a new building on the campus of Howard University in 1936, in which he walked slowly and painfully to the podium from his wheelchair for his dedication speech, and in 1942, when he entered a hospital on foot as a way to identify himself with the injured and those disabled by the war.

Emergence and Growth of a Disability Movement

Nevertheless, opposition to the treatment and public humiliation of the disabled increased; the first wave of the disability movement resulted in the creation of various groups to address the rights of those with disabilities. Veterans of World War I who had been blinded, as well as other visually impaired individuals, created the American Foundation for the Blind (AFB), which became instrumental in the education of the public regarding visual impairments. The League of the Physically Handicapped, which helped to make disability discrimination visible as one of the first organizations to articulate a sense of purpose, included mainly individuals who suffered from mobility impairments, but also polio victims such as Florence Haskell, who had contracted polio during the first major polio epidemic in the United States in 1916. In addition, various organizations were organized by parents and friends of those with developmental disabilities, such as the New York Association for the Help of Retarded Children (AHRC), founded in 1949 by the mother of a child with Down syndrome, Ann Greenberg, and the Association for Retarded Citizens (ARC), founded in 1950.

Organizations such as these were organized on a local and national level, and increased public awareness of the need for federal disability support. A new type of disability organization began in the latter part of the twentieth century, with the founding of the Boston Center for Independent Living in Boston in 1972 and the Center for Independent Living in Berkeley, California, later that same year. Both were concerned with the civil rights of individuals with disabilities

North Dakota governor John Hoeven speaks with reporters in his office on February 10, 2003. To better understand the challenges faced by people with disabilities, Hoeven and other officials "adopted" a disability for a day. *(AP Wide World Photos)*

and argued that, without the necessary services, individuals with disabilities would be denied a role as citizens.

This resulted in passage of the Rehabilitation Act of 1973, which contained Sections 503 and 504, both of which broadened the concept of those who could perhaps benefit from rehabilitation assistance. Section 503 requires those who hold federal contracts to implement Affirmative Action programs for hiring individuals with disabilities, while Section 504 prohibits any type of discrimination because of a disability in any federally funded program. The latter section has received the most coverage because of its inclusion of students with disabilities in education. As part of this act, the term *disability* finally received a national definition, in respect to (1) a physical or mental impairment that substantially limits one or more of the major life activities of such individual, (2) a record of such an impairment, and (3) being regarded as having such an impairment. The definition of major life activities includes mobility, self-care, education, communication, socialization, and employment, whereas the concept of "substantially limits" refers to the inability to perform a major life activity. Title V of the Rehabilitation Act of 1973 has been regarded as the first national civil rights legislation for individuals with disabilities.

Perhaps the greatest outcome of this act was the push for inclusion in the school system, and as a result of Section 504, schools are required to demonstrate compliance with this section. For example, quotas for admission of persons with disabilities are prohibited by Section 504; therefore, students cannot be excluded solely on the basis of a disability. Similarly, preadmission inquiries regarding the presence of a disability are prohibited as well; therefore, schools cannot ask questions about either the existence of, or the limitations of, a disability on an admission application.

However, as disability advocate Jane Jarrow noted in her work, *The Impact of Section 504 on Postsecondary Education* (1992), "After admission, it is appropriate for the institution to ask for any information that may be pertinent to [a student's] enrollment."

Americans with Disabilities Act

The radicalism continued with the 1990 enactment of the Americans with Disabilities Act (ADA), signed on July 26, 1990, by President George Bush, who commented, "Let the shameful wall of exclusion finally come tumbling down." Even with such a public acknowledgment, the general public has avoided acknowledging information on disability. In a 1998 study of adults, including adults with disabilities, only 54 percent of the respondents had heard of the ADA, which in itself is a good demonstration of the educational challenges involved in promoting awareness of disabilities.

As authors Doris Fleischer and Frieda Zames noted in *The Disability Rights Movement: From Charity to Confrontation* (2001), "while critics of the ADA overestimate the cost of such accommodation, they also underestimate the cost of discrimination, not only to individuals with disabilities, but also to society in general." Yet another commentator, Kathi J. Pugh, wrote in the Winter 2000 issue of the American Bar Association human rights journal, "The ADA opened up the private sector in the same way that its counterpart, Section 504 of the Rehabilitation Act, required government entities to provide access to public facilities and programs for people with disabilities." In creating the ADA, Congress specified three major goals: the elimination of arbitrary barriers; inequality of opportunity; and unnecessary dependency; the ADA specifies that any legal action alleging any type of violation be brought against state governments as well as private entities.

Learning and Psychiatric Disabilities

Perhaps the most recognizable form of disability is the category of learning disabilities. Individuals with learning disabilities have been typecast as unable to learn, but it is essential to remember that these disabilities usually affect only certain limited areas of a child's development.

A learning disability is a hidden disability, and affects an individual's ability to interpret what he/she sees or hears and then link that information from different parts of the brain. The ability to integrate a student into the postsecondary learning environment is an important key not only for retention efforts, but also for the well-being of the student. The development of meaningful academic support services, including disability support, can ease student transition from the frequently more structured secondary school environment to the less structured academic and social systems of a postsecondary institution.

An academically supportive environment may offer services, including remedial and academic advising; disability support services; counseling services; and assessment. Each of these support services can be instrumental in a college education, but the provision of disability support is crucial for students with disabilities. Colleges have as their goal the achievement of certain desired student outcomes, and education can be defined as a threefold process that prepares students for the development of knowledge; the training of mental capabilities; and the development of character. For students with disabilities, the development of these three characteristics is augmented by an even more important capability, the ability to self-advocate.

According to a recent survey from the National Clearinghouse on Postsecondary Education for Individuals with Disabilities, one in eleven full-time first-year students entering college in 1998 self-reported a disability. This translates to approximately 154,520 college students, or about 9 percent of the total number of freshmen, who reported a wide range of disabilities, varying from auditory and speech-related to learning or physical disabilities. This same survey compared this 9 percent figure with the other 91 percent of students and noted that both disabled and nondisabled students listed similar reasons for wanting to attend college.

These reasons included a desire to increase their knowledge, to prepare for graduate school, to become more cultured persons, and, most important, to get "better jobs" through a college education. Students from both groups had also met or exceeded the recommended number of years of study in high school for English, history and American government, computer science, and arts and/or music. However, when comparing disabled students with nondisabled students who enrolled in college, great discrepancies became apparent in the numbers who had not met or exceeded the recommended years of high school study in math, foreign languages, and the biological or physical sciences.

Students with disabilities tended to take fewer courses in the latter criteria areas, and they also scored remarkably lower in tests of self-esteem, emotional well-being, and academic or physical ability. This sur-

vey observed that more students with disabilities were entering college, but the number of students with learning disabilities has increased the most—from 25 percent in a 1991 survey to 41 percent in the 1998 survey.

A learning disability refers to a multiplicity of disorders that limit the ability to listen, speak, write, reason, use quantitative skills, and socialize. The disability is either inherited or is related to a dysfunction of the central nervous system. The National Center for Learning Disabilities defines learning disabilities as "a group of disorders that affect the ability to acquire and use listening, speaking, reading, writing, reasoning, or math skills." Yet, often those students classified with learning disabilities have average or even above-average intelligence. In an article in the January 1998 edition of *Phi Delta Kappan*, Louise Spear-Swerling and Robert Sternberg argue that students enter school with individual differences in cognitive abilities that make some students more susceptible to school failure. In addition, the negative attitudes of faculty members toward providing accommodations may in fact provide some explanation for why some students with disabilities are not successful at the postsecondary level.

Access is the key to a successful college experience for students with disabilities, and faculty play an essential role in providing this access. The role of faculty members when working with students with disabilities is no different from their role when teaching nondisabled students. Their role is that of teacher and mentor, but faculty awareness of disabilities varies from comprehension to distrust of students with disabilities, particularly of those students with learning disabilities. In Tonette S. Rocco's 1997 research on the perception of faculty members regarding disability, he found that most faculty members "questioned the existence of certain conditions or, if they existed, the appropriateness of classifying the condition of a disability."

The situation becomes magnified when faculty encounter a student with learning or psychiatric disabilities, since these are "hidden" disabilities. In an article entitled "Accommodating College Students with Learning Disabilities," Sally Scott stated: "Surveys of faculty attitudes reveal that the large majority of faculty are willing to accommodate students with learning disabilities but struggle with ethical concerns in balancing the rights of students with learning disabilities with the academic integrity of the course, program of study, and institution." This statement can also be applied to any student with a disability, not only those with learning disabilities. Faculty oblivion can be resolved with the assistance of academic support professionals, particularly disability support service providers.

Disability support service providers often have a constant struggle explaining their position to faculty and staff who either prefer to remain oblivious to the constantly changing educational trends or prefer their close-minded approach to one of awareness. This challenge includes constant explanation of the law, particularly Section 504 of the 1973 Rehabilitation Act, which requires that faculty and staff be apprised of the following stipulations:

1. that no student may be excluded from any course or courses of study solely on the basis of disability;
2. that modification or waivers in degree or course requirements may be necessary to meet the requirements of some students with disabilities;
3. that prohibitive rules, such as those banning tape recorders from the classroom, be waived for students with disabilities;
4. that classes be rescheduled to permit access for students with mobility impairments;
5. that it is discriminatory to counsel students with disabilities toward more restrictive careers than their counterparts without disabilities.

Academic accommodations, including the tape recording of lectures; extended time on exams, as well as the opportunity to take exams in a distraction-free area; no penalty for spelling errors on in-class writing assignments; and the opportunity to take oral, instead of written, exams, are a direct result of the provisions of the 1973 act. The most important role of the disability support provider is to assist students in becoming successful, independent learners. Students with disabilities do not lack an ability to use learning strategies, but they often do not possess an understanding of how to apply appropriate strategies. An understanding of social implications is useful for students of all types, both disabled and nondisabled. It is important to know why students think they succeed or fail at learning, since this impacts on their self-image as college students. Due to a history in elementary and secondary education, students may feel that since they were failures before college, they might be failures in college as well, and that, if they succeed in a particular course, this success is due more to luck than to effort. Through years of internalizing labels of stupidity, these students' self-esteem is weak. Conse-

quently, these students have a critical need to adopt strategies for learning; this is where the interaction between faculty and academic support services is crucial to the well-being and self-efficacy of the student.

The student movement, as well as the disability movement in general, has forced the concept of disability to be recognizable by policymakers. As David Pfeiffer noted, "The passage of the ADA marked the political maturation of the disability movement." The movement itself faces problems, particularly with the poor implementation of the ADA, as well as the occasional public backlash against the ADA. The economy has a direct link to the efficacy of the ADA; if there are few open jobs, then those unemployed individuals with disabilities will not be able to use the ADA to gain employment. Quite possibly, the court decisions could weaken the efficacy of the ADA, as well as other disability-related legislation, particularly in terms of funding for services. The concept of disability is one that is constantly changing, and the history of the disability rights movement encompasses all aspects of civil rights, as well as the concept of American individualism.

Environmental Movement

Introduction

Human beings have always altered their environment. Yet it took hundreds of years encompassing the Renaissance, the Enlightenment, and the rise of capitalism for the idea to take hold that conquering the natural environment will advance human civilization. Indeed, for most of human history, people understood nature as a given, as an integral aspect of their society, and not as something apart. In taking from their environment, people recognized the need to give back, whether that meant migrating from one hunting ground to another or leaving a field fallow so that it might regenerate its nutrients. With the rise of market economies and scientific reasoning, however, human beings began to break their ties with the environment. Nature became an instrument of progress, a set of resources to be consumed in the development of human society. Technological advancement, itself the result of the human manipulation of the physical world, increased the possibilities for the exploitation of natural resources. Water could power factories; heat could shape iron into tools; steam could drive machines. Whole new industries transformed society, reducing human vulnerability to natural disaster and reshaping the relationship between people and nature.

Rather than search for a balance between nature and civilization, economic, intellectual, and political leaders increasingly juxtaposed the two. They insisted that a materially prosperous and enlightened society required the subordination of primitive nature to human design. But in extolling material, scientific, and intellectual progress they ignored the environmental and human costs. Environmentalists, by contrast, paid very close attention to those costs. They still do, as they seek to redress the balance between nature and civilization.

In the United States, the focus and form of environmental activism varied over time and place. The two main poles of environmentalism have been conservation and preservation, with many activists combining the two in some fashion. Conservationists have sought to regulate the human use of nature, while preservationists have sought to keep the natural environment in its original form. Some environmentalists, including many who are neither conservationists nor preservationists, have been most concerned about the impact of environmental destruction on human beings. Others have worried most about the degradation of the natural world itself, such as the disappearance of endangered species, the loss of water and forest ecosystems, or the obliteration of beautiful geological formations. To achieve their goals, environmentalists have engaged in lobbying, advocacy, lawsuits, private conservation and preservation, public protest, nonviolent direct action, and, in a few extreme cases, violence against property. Their success has fluctuated, determined not just by their strategies and tactics but also by technological advancements that both harmed and protected the environment, by political developments that expanded the meaning of rights and altered the balance of power between competing interests, by economic changes that modified how people work with nature, and by cultural developments that transformed how people play with nature.

The first American environmentalists were the Transcendentalists, a group of literary, philosophical, and religious thinkers centered in New England during the first half of the nineteenth century. They reveled in the glory of nature, which held for them spiritual significance as a reflection of God's work and as a source of inspiration for individuals to find the God within them. Transcendentalists counterpoised the sanctity of nature to the profanity of civilization and condemned the pursuit of wealth and power for its destruction of nature, its anthropocentrism, and its corruption of the human soul. Their reverence for nature unconsciously echoed ideas about the natural world held by premodern peoples around the globe, such as some Native Americans, Buddhists, and animists. Although later environmentalists found more rational justifications for protecting the environment, the veneration of nature has remained a more or less powerful undercurrent within environmental thought.

Conservationism has been a more practical form of

environmentalism. Emerging in response to environmental degradation caused by industrialization and led by middle-class reformers, conservationism has sought to curb the excesses of industrial capitalism by regulating the use of natural resources. Conservationists believe that the public interest in natural resources must be protected from individual abuse, which the competitive economy makes likely. Thus, they have sought government limits on fishing, hunting, tree cutting, oil drilling, dam building, coal mining, waste disposal, and pollution. Unlike the Transcendentalists, conservationists believe that the application of scientific principles to natural resource management can achieve a balance between the requirements of civilization and the maintenance of natural resources. Despite their professed public concern, conservationists have had a reputation for elitism, due in part to their emphasis on expert decision making for resource management, their middle- and upper-class social status, and their disregard for the environmental impact of industry on poor communities. Wealthy conservationists have demonstrated this elitism by purchasing large tracts of land rather than fighting to put the land in the public domain where its use might be democratically determined. Conservationists protect nature so that human beings can enjoy its beauty and, within limits, its bounty. Nature, especially in its monumental formations such as the Grand Canyon and Yosemite National Park, also serves to give the United States a distinctive national character.

Preservationists have shared much with conservationists, though they have been more skeptical about regulating the impact of industry and more reverent in their appreciation of nature. They have insisted on removing as much of the natural world from human exploitation as possible, through the designation of national parks and protected wilderness, hunting and fishing bans, logging prohibitions, and the enumeration of protected species. Whereas conservationists have seen nature as a source of both sustenance and pleasure, preservationists protect nature for its own sake. Early preservationists, such as John Muir, drew on religious inspiration, much like the Transcendentalists, in their campaigns to establish national parks. Later preservationists found aesthetic and recreational justification for their efforts. Since the late twentieth century, a more holistic approach derived from ecology has infused the preservationist wing of the environmental movement. This approach places human beings within a larger ecosystem that includes the living and nonliving elements of the natural world, stressing the connectedness among all the elements.

Since industrialization, a more human-centered form of environmentalism has sought to ameliorate the toll of industrial activity on urban populations. Since the late nineteenth century, this urban environmentalism has fought for the establishment and professionalization of sanitation, water treatment, disease prevention, pollution control, toxic substance regulation, and occupational safety. Preventing the industrial degradation of both the natural and built environments has been seen as key to improving public health. The late twentieth century has seen the environmental justice movement apply a similar approach in fighting the placement of toxic industry and waste facilities near concentrations of poor people and people of color. It has been no coincidence that such communities suffer disproportionately from health problems associated with pollution and other forms of environmental destruction. Combining the lessons of early urban environmentalists and later civil rights activists, the environmental justice movement has challenged the elitism of mainstream environmentalism, government, and industry.

Environmentalism has experienced considerable growth and success in the United States. The movement has preserved enormous tracts of wilderness and many species of wildlife, while improving the nation's urban settings. Environmentalism is now extremely popular. The United States' prosperity and the growth of tourism have given more people the chance to experience wilderness and develop an appreciation for preservation. Even people who do not hike, camp, fish, surf, ski, or hunt have the opportunity to experience natural beauty through art and photography, which have popularized the value of untouched nature. Today, environmentalism is a diverse movement that draws support from many sources, including, but not limited to, the lingering romanticism of the Transcendentalists, the nationalism and scientific rationalism of conservationists, the reverence for the nature of preservationists, the expanded rights consciousness of the environmental justice movement, the holistic ecology of scientific environmentalism, and the simple enjoyment of the natural world by so many millions of people.

This section on environmental movements examines the conservation movement from the 1880s to the 1920s. The movement transformed American consciousness of the need to preserve the environment for future generations during a time when economic and corporate interests predominated. Thus, American natural treasures such as the Grand Canyon were protected. The objective of the conservation move-

ment, led by Gifford Pinchot, was to preserve the environment for as many people for as long as possible.

The American appropriate technology movement, originating under British economist E.F. Schumacher in the mid-twentieth century, sought to preserve the environment not just in the United States but also throughout the entire world. The founders of the appropriate movement believed that the Western industrial model of development would lead to the degradation of the environment and would not solve the problem of poverty in the Third World. Western models of development, Schumacher argued, would lead to mass urbanization, urban blight, and the destruction of fragile ecosystems and traditional cultures. The notion of "appropriate" technology was based on small-scale development rather than the development of enormous projects. The leading themes of the appropriate technology movement were democratic participation, ecological sustainability, and widespread distribution of productive wealth. Rather than engaging in huge projects, the movement sought small-scale sustainable development of industry and agriculture.

The environmental justice movement emerged in the late 1980s based on the recognition of the class and racial impact of pollution in American society. Scientists and researchers have demonstrated that hazardous waste sites, dumps, and air and water pollution are unevenly concentrated in poor communities of color. Those communities that were more affluent were able to shift the pollution to those that were working-class and poor. Thus, environmentalism came to be seen as a class problem, with typically poor and minority communities devastated by contaminated land, unsafe drinking water, and hazardous waste sites. The environmental justice movement exposed the inequalities of the American system, one in which environmental pollution was patterned by class and race. Although the movement has highlighted the issue of class and racial bias in pollution, it has not yet significantly transformed the pattern of pollution. Protests and legal battles do have an important influence in diminishing the extent of environmental pollution but are not as successful in significantly addressing the system. The activism among community residents, however, remains strong and vibrant, as working-class people of color seek to demonstrate the inequitable effects of pollution. Since the battle is fought on the legal terrain, against powerful government and corporate interests, community groups have not yet succeeded in fundamentally resolving the problem.

The movement against nuclear weapons began after the United States used atomic weapons against civilian targets in Japan during World War II. The movement picked up steam with the rise of the Cold War and the possibility of global annihilation if the nuclear weapons were to be put to use. Although today the very notion that the United States and the former Soviet Union were willing to use nuclear weapons seems far-fetched, the antinuclear movement gained adherents in the 1980s with the help of scientists who documented the threat to humans posed by nuclear weapons and nuclear power. By the 1980s, the antinuclear movement had gained momentum as a result of the growth of a diverse grassroots movement of peace activists, environmentalists, physicians, labor unions, and students. Still, the mounting proliferation of nuclear weapons throughout the world is posing a significant threat. As more and more countries gain the capacity to produce nuclear weapons, regional and global threats are creating ominous world prospects. The two major nuclear powers, the United States and the former Soviet Union, have sought to reduce the use of nuclear weapons through various arms treaties since the 1970s, but nuclear arsenals on both sides remain sizable.

Nuclear power plants present yet another significant threat to the environment. Popular opinion turned against nuclear power facilities in the wake of the partial meltdown at Three Mile Island in 1979 and the Chernobyl disaster of 1986. The accidents occurred at opposite ends of the globe, increasing the fear that nuclear power plant disasters could occur anywhere. An increasing number of residents living in the vicinity of nuclear plants fear accidents as well as the threat of terrorist attack on the plants.

Animal rights is an environmental movement that frequently gets overlooked, yet since the 1980s a greater number of Americans have become cognizant of the need to protect and preserve other species both in the United States and abroad. Animal rights proponents oppose the exploitation of animals for food, hunting, entertainment, clothing, medical research, and product testing. Although the animal rights movement represents a large array of positions, including animal liberation, ecofeminism, and animal welfare, it has focused national attention on the plight of animals as a growing number of Americans voice their opposition to human cruelty against other species on the planet.

Aaron Brenner

Environmental Movement
Nineteenth and Twentieth Centuries

The United States of America originated in protest and revolution, and one of the successes of American society has been the expansion of political rights to more and more members of the society. In the twentieth century, environmental protest became an increasingly important element in American culture, and the power and complexity of this protest movement increased over the century. By the turn of the new millennium, many Americans considered themselves environmentalists without understanding the nature of American environmentalism or the changes it has undergone.

It is challenging to locate the exact beginnings of American environmentalism. Although it is true that American history is marked by conflicts over control of natural resources dating to the eighteenth century, these battles were not really environmental as the term is defined today. It is more typical to begin a discussion of American environmentalism with the Romantics, transcendentalists, and early wilderness advocates such as David Thoreau, and yet it is equally valid to look to the cities for its roots. The efforts to protect the environment and its health from the worst of Americans' excesses can be more effectively detected in the efforts made in the middle of the nineteenth century to curb pollution in the nation's burgeoning cities, the heart of the exploding Industrial Revolution.

Many Americans are familiar with the story of environmentalism emerging from conservationists and preservationists who fought to create national parks like Yellowstone and Yosemite and set aside vast tracts of forest and grazing lands through the national forest system. The story of American environmentalism is remarkably more complex than this, however. Historian Robert Gottlieb identifies two strong strands of environmentalism that emerged in the twentieth century. Part of the impetus arose from the well-known tradition of conservation and preservation, but another major factor in the emergence of twentieth-century environmentalism was the tradition of combating urban air pollution and waste problems—in short, environmentalism addressing problems with a negative impact on human health. In the 1960s, American environmentalism would bloom into a complex and wide-ranging movement combating air pollution, species extinction, water pollution, and habitat loss among other issues.

There is a long tradition of municipal reform and efforts to combat pollution in the cities as an equally important historic tradition for tracing the roots of the environmental movement. Another leader in the environmental tradition, to be accorded value equal to that of John Muir, Robert Marshall, and Gifford Pinchot, is Alice Hamilton (1869–1970). Gottlieb characterizes her as "a tenacious reformer, a compassionate advocate, a cautious and careful researcher," and then proceeds to call her America's "first great urban/industrial environmentalist." Hull House is well known as a model of the settlement house and a center for reform activities in Chicago during the Progressive Era, providing the model for other settlement houses around the nation. Hamilton attended medical school and then took a position as professor of pathology at Northwestern University. Later, Hamilton's activities at Hull House allowed her to explore the relationship between environment and disease. Along with many other reform activities, Hamilton began to pursue investigation into the connections between work chemicals and various diseases. She led the way in investigating work risks in the United States and while working in the area of community health, researched a wide range of industries and the exposure of workers to toxic materials.

Decades before the emergence of the roles of science and technology in environmental crises, Hamilton warned about the dangers of chemical and petroleum products to human health. She was a pio-

HENRY DAVID THOREAU (1817–1862)

Henry David Thoreau is considered one of the most influential figures in American thought and literature. A supreme individualist, he championed the human spirit against materialism and social conformity. Though he was largely a failure during his lifetime, his work gained widespread popularity in both the civil rights and environmental movements of the twentieth century. When he died on May 6, 1862, he was little known outside his hometown.

Born in Concord, Massachusetts on July 12, 1817, Thoreau grew up in Concord and attended Harvard, where he was known as a serious, though unconventional, scholar. During his Harvard years, he was exposed to the writings of Ralph Waldo Emerson, the transcendentalist writer who later became his chief mentor and friend. After graduation in 1837, Thoreau worked for a time in his father's pencil shop and taught at a grammar school. A canoe trip that he and his brother John took along the Concord and Merrimack rivers in 1839 confirmed for him that he ought to be not a schoolmaster but a poet of nature. In 1841, he was invited to live in the Emerson household, where he remained intermittently until 1843. He served as handyman and assistant to Emerson, helping to edit and contributing poetry and prose to the transcendentalist magazine *The Dial.* Along with Emerson, Thoreau stands as one of the two giants of the American transcendentalists. He adapted ideas garnered from the then-current romantic literatures in order to extend American libertarianism and individualism beyond the political and religious spheres to those of social and personal life.

In 1845, Thoreau built himself a small cabin on land Emerson owned on the shore of Walden Pond, near Concord. There he led a life free of materialistic pursuits and supported himself by growing vegetables and by surveying and doing odd jobs in the nearby village for the next two years. He devoted most of his time to observing nature, reading, and writing, and he kept a detailed journal of his observations, activities, and thoughts. It was from this journal that he later culled his masterpiece, *Walden, or Life in the Woods* (1854). Thoreau's experience at Walden has become a symbol both to libertarians because of the perceived success in living by himself and to environmentalists because of the nature writings it produced.

The personal journal, begun in 1837 at the suggestion of Emerson, was also the source of his first book, *A Week on the Concord and Merrimack Rivers* (1849), as well as of his posthumously published *Excursions* (1863), *The Maine Woods* (1864), *Cape Cod* (1865), and *A Yankee in Canada* (1866). His books sold very poorly during his lifetime. After his stay at Walden, he then returned to Emerson's home for two more years and worked odd jobs before taking over his father's business. He also became a dedicated abolitionist, aiding fleeing slaves who had come north via the Underground Railroad.

One of Thoreau's most important works, the essay "Civil Disobedience" (1849), grew out of an overnight stay in prison in 1846 as a result of his refusal to pay a poll tax that supported the Mexican War, which to Thoreau represented an effort to extend slavery. Thoreau's advocacy of civil disobedience as a means for the individual to protest those actions of his government that he considered unjust has had a wide-ranging impact. The work heavily influenced the British labor movement, the passive resistance independence movement led by Mahatma Gandhi in India, and the nonviolent civil rights movement led by Martin Luther King Jr. in the United States.

Thoreau's early reputation came as a nature writer, though he declined membership in any scientific societies. He emphasized the dynamic ecology of the natural world. He was a pioneer ecologist and conservationist, and was among the first Americans to recognize that the country's natural resources were not inexhaustible. In his writings, Thoreau was concerned primarily with the possibilities for human culture provided by the American natural environment.

James G. Lewis

neer in an important component of American environmentalism, that is, the human living and working environments. Her investigations revealed the extent to which lead was damaging workers' health, and she led the efforts to clean up workplaces and find healthful solutions to the impacts of lead. While working in Illinois, she found 578 cases of lead poisoning in seventy-seven lead-dependent industries. As a result of her discoveries, Illinois passed stricter laws regulating the use of lead, arsenic, brass, and other materials in 1911. This reform movement gained greater strength in the early part of the twentieth century with the participation of important thinkers and leaders such as Hamilton.

American cities in the late nineteenth century were overwhelmed by vast amounts of refuse and the

ALICE HAMILTON (1869–1970)

Alice Hamilton was known for her research on industrial diseases and became a leading American authority on lead poisoning and one of a handful of worldwide specialists on industrial diseases by 1916. By actively publicizing the danger to workers' health from industrial toxic substances such as lead and mercury, she contributed to the passage of workers' compensation laws and to the development of safer working conditions.

Born in New York City on February 27, 1869, to a grocer and his wife, Alice was raised in Indiana. She received her medical degree from the University of Michigan at Ann Arbor in 1893 and continued her studies at Johns Hopkins University, Baltimore, Maryland. She traveled to Germany with her sister, Edith Hamilton, and together they attended the universities of Munich and Leipzich for a year, where Alice attended lectures in bacteriology and pathology on the condition that she make herself inconspicuous to male students and professors. Edith went on to become a famous author and classicist.

From 1897 to 1919, Alice was a resident of Hull-House in Chicago. Her friendship with reformer Jane Addams led to her combining scientific research with her latent reformist zeal. Later during World War I, the two traveled as part of a delegation to Europe to argue for an end to the war. During the typhoid fever epidemic in Chicago in 1902, Hamilton made a connection between improper sewage disposal and the role of flies in transmitting the disease, and her findings led to reorganization of the Chicago Health Department. She then noted that the health problems of many of the immigrant poor were due to unsafe conditions and noxious chemicals, especially lead dust, to which they were being exposed on the job. At the time, there were no laws regulating safety at work, and employers routinely fired sick workers and replaced them with new ones looking for jobs.

Hamilton became director of the Occupational Disease Commission when it was created in 1910, the first such commission in the world. As a result of its findings, Illinois passed several workers' compensation laws. The laws introduced a new concept that workers were entitled to compensation for health impairment and injuries sustained on the job. Her reports on lead, and later on rubber and munitions, led to improved safety standards nationwide. Focusing on industrial diseases, she served as a special investigator for the United States Bureau of Labor from 1911 to 1921 in an unpaid position. She became the first female faculty member at Harvard University's Medical School in 1919 and then Harvard's first professor of public health in 1925, where she taught until 1935. She eventually published hundreds of studies on industrial toxicology, several books, and an autobiography. Hamilton died in Hadlyme, Connecticut, on September 22, 1970.

James G. Lewis

sickness and disease that it brought. As industrialism produced more and cheaper goods while centralizing labor in cities for factory work, the amount of pollution produced by city residents increased dramatically. At the same time, continued dependence on horses for transportation and labor in the cities worsened the urban sanitation woes. In Brooklyn horses produced about 200 tons of waste a day, and in Milwaukee the amount was approximately 133 tons a day. Cleaning that waste was difficult enough, but disposing of horse corpses provided yet another sanitation problem. As a result, disease ran rampant in urban centers. Sanitation became professionalized in the 1890s and early twentieth century, reflecting trends in the Progressive Era, a time of substantial reforms in the United States and the professionalization of many occupations.

Air pollution was so bad in Chicago that the first professional group to deal with such issues was organized there in 1891 in order to clean the air for the upcoming 1893 Columbia Exposition. Furthermore, a national association called the International Association for the Prevention of Smoke was formed in 1907 in order to remedy air pollution issues.

George Waring, commissioner of sanitation for New York City during the 1890s, sought to create a rational and effective garbage collection system for the polluted city. Anything would have been an improvement on a "nearly nonexistent garbage collection system." Waring was also an important symbol of this new professional field and urban reform movement. Historian John Opie has explained his importance as a symbol, writing that Waring would arrive at a trouble spot in "a spotless uniform, pith helmet, and shining boots." Waring's was truly a war on garbage and pollution, and his "White Wings" sanitation workers attacked multiple problems such as the heaps of horse manure in the streets, garbage, factory waste, and human waste. As a result, they helped improve the health and livability of New York City. Other large

cities followed this model. In addition, sanitary engineers dealt with city health by creating healthy water supplies and wastewater disposal facilities.

Women organized in St. Louis, Missouri, in an effort to reduce the dangers of smoke pollution. In 1910, the Wednesday Club, an organization of 500 women, took on this issue and proceeded to look for solutions. Although a law was in place to restrict smoke, there was no enforcement authority; the women of the Wednesday Club, therefore, worked to solve this problem. They provided educational forums explaining the dangers smoke pollution presented to human health, housekeeping, city planning, and other issues, and they also sought to recruit more people to their movement. By 1912, the Women's Organization for Smoke Abatement in St. Louis had 1,300 members. Gaining financial assistance from a local citizen, they organized the city into districts and went out to report and enforce smoke pollution restrictions in the city. They achieved a great deal of success, forcing private homes and industry into compliance with smoke abatement regulations.

Pittsburgh exemplified the worst excesses of the American industrial era. Situated at the juncture of the Allegheny and Monongahela rivers, this once beautiful site became a center of coal mining and steel production by leveling and destroying the hills to the point that the original landscape became unrecognizable. The bucolic countryside now was marred by ubiquitous railroad coal cars entering and leaving mines and mounds of debris dispersed throughout the area.

The conditions of the city attracted the attention of reformers during the Progressive Era. A cooperative effort among the Russell Sage Foundation, the government of Pittsburgh, and the local citizenry led to an investigation into the quality of life in the city. The conditions revealed by the study provided a devastating indictment of industrial capitalism in Pittsburgh, where laborers generally worked twelve-hour days, seven days a week, for low wages, and industrialists did little to curtail the worst excesses of business and urban life. For example, in the years 1883–1908 approximately 55,000 Pittsburgh residents caught typhoid, and roughly 7,500 men, women, and children died from the disease during that time period. The Pittsburgh mortality rate was 130 per 100,000, a rate that at the time was thirty times worse than the rate in Berlin, Germany, and six times worse than that in New York City, which was also known for its frightful conditions. The typhoid problem arose from extreme water pollution. According to Opie:

> Pittsburgh's drinking water was drawn from the Allegheny or Monongahela rivers several miles upstream of the city. Unfortunately, the upstream industries along the river shores dumped soluble chemical products—"organic and inorganic, acid and alkali; oils, and other carbon compounds." Further upstream the human sewage of 350,000 people of 75 towns flowed untreated into the rivers. The Russell Sage Foundation reported "flesh-disintegrated and putrescent" dead animals and the "off-scourings of iron and steel mills, tanneries, slaughter houses" floating on the rivers. The report told of a family of five with a 16-year-old daughter who caught typhoid and tuberculosis. "Not being strong enough to return to her former employment, she secured work in a bakery where she was subsequently seen coughing as she wrapped up bread for customers.

For reasons beyond disease, Pittsburgh was a grim place to live for the average worker. Tenements were rundown and poorly maintained, crowded, and prone to fast and devastating fires. Worsening the situation was the discrepancy in property tax rates between the poor and middle classes, who actually paid a higher property tax rate than the upper class, which included industrialists such as Andrew Mellon and Andrew Carnegie. National outrage and embarrassment in Pittsburgh prompted the city to enact reforms over the next few decades to address air and water pollution and improve living conditions within the city.

Many activists successfully fought to better health conditions in the cities, improving the environment for the people living there. Others fought another battle, trying to preserve resources and wild places against the excesses of industrial capitalism. Conservation and preservation would become important movements in twentieth-century American environmentalism.

MANAGING NATURE: THE PROGRESSIVE ERA 1894–1920

During the Progressive Era, the conservation movement emerged in response to overexploitation of natural resources and environmental degradation. Most Progressive leaders of Progressive movement organizations were members of the professional classes—people of high education and status in American society. Doctors, editors, college professors, small businessmen, and lawyers were active in the Progressive movement. The movement gained momentum in a period of economic and political stability. Rather than

seeking major change, the Progressives sought to adjust the existing order to better adhere to the values of restraint, conservation, support of the community, and participatory democracy that they had been raised in and still valued in the face of a changing society, which in their view, assigned undue power to those accruing massive capital. In their eyes, the creation of a system of bureaucratic management through government would allow them not only to curb the excesses of industrial capitalism but also to ensure continuation of traditional preindustrial values in American society. The movement is most commonly understood as an effort to curb the worst excesses of capitalism. As members of the Progressive movement, conservationists sought to regulate and correct the excesses of industrial capitalism in regards to its exploitation of natural resources as well as the American people. The conservationists saw themselves as the conservators of democracy, bringing restraint over a new capitalist era that, while running amok, threatened not only natural resources but the freedom and opportunities of American citizens as well.

Conservationists sought to manage the use of natural resources efficiently. They were disturbed and angered by capitalism's exploitation of natural resources, leading to the overharvest of different resources like lumber and fish, and environmental degradation resulting from wasteful practices. Conservationists believed that laws and management based on good science would allow the government to manage resource use in such a way that present needs could be met while preserving species for the use of future generations. Gifford Pinchot and President Theodore Roosevelt were leaders of this movement and remain strong symbols of the progressive conservationists. Some historians refer to the split between preservationists and conservationists as a conflict between amateurs (the preservationists) and professionals (the conservationists). The conservationists were better organized and more effective politically, and led by Pinchot, the head of the Department of the Interior under President Roosevelt, they imposed a conservationist model on American environmentalism that would last until the years following World War II.

Gifford Pinchot: Conservationist

A member of the upper class, Gifford Pinchot (1865–1946) had always been interested in nature. In the late 1880s, after graduating from Yale University, Pinchot traveled to Europe to study professional forestry in Germany and at the Ecole Nationale Forestiere in Nancy, France. Upon his return to the United States in 1891, Pinchot became America's first professional forester. He was critical of managers of industry, miners, and ranchers who had laid waste to the American landscape, and, like many other conservationists, he sought to ameliorate their impact through the application of science to resource management. Later, as chief of the Division of Forestry in the Department of Agriculture, he was able to promote the professionalization of forestry and also influence political opinion on the need for professional forestry and the preservation of forests. He also managed to have the nation's federal forest reserves transferred to his agency in 1905.

Pinchot's close friendship with President Roosevelt allowed him to consolidate his position and promote conservation in the federal government. Under his leadership, more and increasingly stringent regulations were passed on mining, grazing, and other natural resource activities. However, his dedication to the conservation ideology compelled him to ignore legitimate preservationist goals. He tried, and failed, to have National Park lands transferred to his department so that the forests could be logged, and he supported the effort to dam Hetch Hetchy, a river in Yosemite National Park, and flood the valley in order to provide water for San Francisco. The 1908 Governor's Conference on Conservation, from which he excluded John Muir owing to the split that had emerged between them and his desire to promote the conservationist agenda, did help propel the cause forward. His career came to a close in the Taft administration when he attacked both President William Taft and Secretary of the Interior Richard Ballinger, who wanted to turn public lands in Alaska with coal into private land. He was fired for his attack, and the American public was furious at both Ballinger's efforts and the firing of Pinchot. Pinchot remained active in conservation issues and played an important role in making it the dominant American environmental ethic for several years.

Pinchot was a hardheaded and determined advocate of the conservation ethic and earned many enemies in his lifetime; in later years, he also came under severe criticism by environmentalists and some historians. Although others worked in conservation before Pinchot and he did not invent the field, he did play a central role in promoting the conservation ethic in forestry and other areas. Although he was overly critical of the preservationist approach and too willing to accommodate industry, he also helped enact conservation measures that helped protect important natural resources such as forests and grasslands.

Holding a walking stick, John Muir sits with fellow naturalist and environmentalist John Burroughs in Yosemite National Park in California in the early 1900s. *(Colorado Historical Society)*

President Theodore Roosevelt is well known as an early conservationist leader and played a central role in this important early stage of American environmentalism. As a boy, he was fascinated with nature and became an amateur naturalist; he entered college intending to become a professional naturalist until politics caught his interest. After the nearly simultaneous deaths of his mother and wife, Roosevelt headed West searching for solace in the badlands of South Dakota. Hunting and traveling across the Western landscape reinforced Roosevelt's belief that nature could and should be protected while also being used for the benefit of humankind.

As a true Renaissance man, Roosevelt read widely and demonstrated a remarkable knowledge of nature, among many other topics. After he became president, he would walk the White House grounds in the mornings listening to bird song and recognized various species and their migration patterns. His natural inclination toward preservation and his love of nature would contribute greatly to the expanding conservation movement.

President Roosevelt was a classic conservationist, believing that the chief value of nature lay in the uses it could be put to for humans. He also believed in managing nature efficiently and in preserving resources for the use of future generations, reflecting a strong sense of stewardship. In his administration, he supported and passed increasingly stringent regulations on grazing, mining, and logging. Furthermore, at the stroke of a pen as his administration came to a close, he also set aside millions of acres of forestlands. While he was a conservationist, he also loved nature for its recreational qualities and for its beauty and wildness. In this sense he shared, at least for a while, a lot in common with John Muir. Muir and Roosevelt formed a relationship that would have important ramifications for the future of Yosemite Na-

JOHN MUIR (1838–1914)

John Muir was born in Dunbar, Scotland, on April 21, 1838. He attended local schools until 1849 when the Muir family emigrated to the United States, settling first at Fountain Lake and then moving to a farm near Portage, Wisconsin. In his free time he liked to wander in the woods near his home, and he became an astute observer of nature. In 1860, he entered the University of Wisconsin. He made sufficient grades, but after three years left Madison to travel the northern United States and Canada, odd jobbing his way through the yet unspoiled land.

In 1867, after sustaining and recovering from an eye injury, Muir resolved to return to the fields and woods and began his years of wanderlust. He walked a thousand miles from Indianapolis to the Gulf of Mexico, sailed to Cuba and later to Panama, where he crossed the Isthmus and sailed up the West Coast, landing in San Francisco in March 1868. California became his home thereafter.

A self-taught naturalist, Muir concentrated his studies on California's Sierra Nevada and Yosemite Valley, which brought him national attention. Famous men of the time like geologist Joseph Le Conte, botanist Asa Gray, and transcendentalist writer Ralph Waldo Emerson came to visit and share in his enthusiasm for nature. Beginning in 1874, a series of articles by Muir entitled "Studies in the Sierra" launched his successful career as a writer. He left the mountains and lived for awhile in Oakland, California. From there he took many trips, including his first to Alaska in 1879, where he discovered Glacier Bay. In 1880, he married Louie Wanda Strentzel and moved to Martinez, California, where they raised their two daughters while managing the family fruit ranch with great success. After ten years of ranching, Muir returned to his travels. He went to Alaska several times, to Australia, South America, Africa, Europe, China, Japan, and, of course, to the Sierra Nevada Mountains.

To support himself and promote his cause, he turned to writing, publishing 300 articles and 10 major books that recounted his travels and expounded his naturalist philosophy. Muir's love of the Sierra Nevadas gave his writings a spiritual quality. Through a series of articles appearing in *Century* magazine, Muir drew attention to the devastation of mountain meadows and forests by sheep and cattle. With the help of *Century*'s associate editor, Robert Underwood Johnson, Muir worked to end this destruction. In 1890, owing in large part to the efforts of Muir and Johnson, an act of Congress created Yosemite National Park. Muir was also personally involved in the creation of Sequoia, Mount Rainier, Petrified Forest, and Grand Canyon national parks. In 1903, President Theodore Roosevelt visited Muir in his beloved Yosemite. While there, Muir helped lay the foundation of Roosevelt's pioneering conservation programs. Muir is often called the "Father of Our National Park System."

Johnson and others suggested to Muir that an association be formed to protect the newly created Yosemite National Park from the assaults of stockmen and others who would diminish its boundaries. In 1892, Muir and a number of his supporters founded the Sierra Club to continue working for the protection of natural areas. Muir served as the club's president until his death in 1914. Muir and the Sierra Club fought many battles to protect Yosemite and the Sierra Nevada, the most dramatic being the campaign to prevent the damming of the Hetch Hetchy Valley within Yosemite National Park. In 1913, after years of heated debate, the federal government decided to dam and flood the valley for a reservoir to supply the water needs of a growing San Francisco. The following year, after a short illness, Muir died on December 24 in a Los Angeles hospital after visiting his daughter Wanda. His personal and determined involvement in the great conservation questions of the day was and remains an inspiration for environmental activists everywhere. In recognition of his efforts as a conservationist and crusader for national parks and reservations, Muir Woods National Monument was named for him.

James G. Lewis

tional Park when Muir took Roosevelt camping for several nights within Yosemite. Impressed with each other's knowledge of and love for nature, they discussed the subject at length.

John Muir: Wilderness Prophet

John Muir (1838–1914) was the spiritual descendant of Thoreau and the earlier romantics, and he helped create a new way of valuing and understanding nature. He was born in Scotland, but his family moved to central Wisconsin when he was eleven years old. He was raised in a strict Calvinist tradition and was ingrained with a strong work ethic, as were his siblings. On the edge of the settler's frontier as a child and young man, he developed a love for wilderness even as he worked to convert nature into farmland.

Muir left the farm and attended the University of Wisconsin where he studied geology, a field of great importance throughout his life. As a student, he studied botany and gained a grounding in natural sciences, but significantly, he also became familiar with the romantic poet William Wordsworth and transcendentalists Ralph Waldo Emerson and Thoreau. Thoreau's transcendentalism merged religion and the study of nature and would contribute to Muir's interpretation of landscapes as the revelation of the hand of God and as deeply infused with spiritual meaning and importance.

Muir left the university after two and a half years and in an accident in a machine shop was left blind for about a month. Compelled by this experience, he came to believe that God had sent him a message to make more of his life, and he thereupon decided to head for the wilderness. He started off with a thousand-mile walking trip from Indiana down to the Gulf of Mexico, and in his journals from this trip may be found "the seeds of the most basic of his ideas." He wanted to travel up the Amazon and find its source but was deterred by a case of malaria and headed for northern California instead. It was in the Sierra Mountains of California that he found the wilderness he sought, although it was often damaged by human activities. Through his reading of transcendentalists like Emerson and Thoreau, he began interpreting the value of wilderness on its own terms.

Muir drew on his religious faith to interpret nature as containing mighty cathedrals and as replete with spiritual significance. His interpretation of nature attracted many followers. Distraught at the destruction of nature by lumber companies, sheepherders, and many other groups, particularly in his own sacred Yosemite, Muir began working specifically to seek greater protection for wild places. Writing articles for East Coast magazines like *Harper's* and publishing many books on his travels and explorations and leading important figures on adventures into Yosemite, including Roosevelt, Muir strove to inculcate his spiritual appreciation of nature in others. With the cooperation of Robert Underwood Johnson, a publisher from New York, Muir worked to gain federal reserve status for a Yosemite park overrun by concessionaires, recreationalists, butchers, and others looking to make a profit in what Muir considered a cathedral. After Muir gained the support of the Southern Pacific Railroad, which controlled railroad access to the park, a bill protecting 1,500 square miles in the Sierras, including Yosemite, and the Tuolomne River watershed along with other sites, was passed in 1889. In 1890, Yosemite became the nation's second national park, the first being Yellowstone. Following on the heels of this victory, the Sierra Club was created in 1892. The creation of the Sierra Club is one of the most significant events in the history of American environmentalism. The early Sierra Club sought to preserve important natural sites and also led recreational trips into the mountains. The club helped to promote the idea of nature as a useful recreational space in the early twentieth century as well as fighting to preserve outstanding natural sites.

The Hetch Hetchy Battle

The great battle of the early preservationist movement and the young Sierra Club was the effort to block the damming of Hetch Hetchy Valley twenty miles northeast of Yosemite in order to provide drinking water for San Francisco. The Sierra Club emphasized the natural beauty of the valley, with Muir writing, "dam Hetch Hetchy! As well dam for water-tanks the people's cathedrals and churches," asserting his opposition to the building of the Hetch Hetchy dam in Yosemite National Park. Preservationists, dismayed by the dominance of conservationists in determining the future of nature and determined to protect this beautiful valley, organized to fight the city of San Francisco. They were at first successful, blocking early efforts to flood the valley, but without the support of President Roosevelt for preservationist goals and with Pinchot's active support of the project, their efforts were doomed to failure. Although Hetch Hetchy now lies under a reservoir of water, the loss of this particular battle would motivate preservationists in the future and echo as they fought other proposed dam projects.

San Francisco needed a larger and more dependable source of drinking water both because of its fast growth and because the local water company provided poor service and charged high rates. Earlier efforts to dam Hetch Hetchy had been blocked with the help of the Sierra Club, but the city of San Francisco tried again in 1901 to acquire passage of a bill to approve the damming of the valley. Ethan Allen Hitchcock (1835–1909), U.S. Secretary of the Interior from 1898 to 1907 under President McKinley, held strong preservationist values and accordingly blocked this effort in 1903 and 1905. The project to dam the valley gained steam when Pinchot threw his support behind it. Under a new secretary who was more amenable to Pinchot's utilitarian philosophy, a hearing was held in San Francisco while the Sierra Club was away on an outing in the Sierra Mountains.

Muir and Johnson, together with the majority of the Sierra Club members, opposed the damming of Hetch Hetchy. Like Yosemite, it was a beautiful site that deserved to be protected. One historian, Alfred Runte, has argued that preservationists like Muir and early members of the Sierra Club fought to preserve monumental nature, sites like Yosemite, which offered awe-inspiring views, mountains, and waterfalls. Runte, contended that the urge to create parks and monuments arose in part from a strong sense of American cultural inadequacy which could be traced to its violent separation from Europe and its cultural legacies entailed by the American Revolution. By emphasizing the wonders of nature such as Niagara Falls, and later, places like Yellowstone and the Yosemite Valley, Americans could replace the lost cultural monuments of Europe with natural monuments that were already available on their own magnificent continent. Indeed, for many preservationists, the wonders of nature represented a higher value than that of European art and architecture. Muir wrote, in reference to his beloved Merced Valley, "The whole landscape showed design, like man's noblest sculptures. How wonderful the power of its beauty!"

Americans at the turn of the twentieth century viewed nature as a romantic landscape that filled a cultural niche missing for citizens of a young republic. Monumental landscapes, waterfalls, mountains, and geysers served as a replacement for the lost and longed-for European heritage of ancient cathedrals, castles, and ruins. These monumental places also suggested the golden future awaiting the young republic. This attitude engendered a tendency to set aside lands not based on their resource values or ecological significance but, rather, on their beauty as reflected in a monumental way: towering granite cliffs, cascading waterfalls, and awe-inspiring glaciers.

Counting on his friendship with President Roosevelt, Muir appealed to him to save the beautiful valley, but Roosevelt responded that there was broad support for the dam and he could not afford to appear to be blocking a state's progress for the sake of protecting a river valley. Muir began working to get popular opinion opposed to the dam. The Sierra Club officially opposed the dam and contacted other organizations like mountaineering clubs to oppose the damming of Hetch Hetchy. Supporters of the dam attacked Muir and the preservationists' approach, deriding the idea of nature holding more aesthetic or spiritual values than utilitarian uses, in this case, drinking water for a growing city.

While dam advocates spoke only of drinking water, they resisted suggestions of using alternate sites outside of the park because Hetch Hetchy, located at a high elevation in the mountains, could provide hydroelectric production as well. Voters in a referendum in San Francisco supported the damming of Hetch Hetchy by a vast majority, although one contemporary observer noted that the popularity of the dam probably resulted more from San Franciscans' hatred of the Spring Valley Water Company than from other reasons.

In federal hearings in 1909, dam opponents managed to delay the project for the short term, until 1912, with groups on both sides launching national publicity campaigns. Muir dedicated himself to the effort, using his writing, as in the past, to try to sway public opinion nationwide against the dam. According to Stephen Fox, "he worked fifteen hours a day to finish a book on the Yosemite." It concluded with a ringing chapter on Hetch Hetchy. "These temple destroyers, devotees of ravaging commercialism, seem to have a perfect contempt for Nature and instead of lifting their eyes to the God of the mountains, lift them to the Almighty Dollar." Many conservationists supported the construction of the dam, seeing not only utility in nature but also the possibilities of recreation through the presence of a new reservoir in the mountains. More important, Fox argues that this battle over Hetch Hetchy was a battle between the professionals who had an economic interest in gaining the approval of the project and the amateurs who used their free time and their resources to fight the plan. In the following years, this became a typical pattern in fights over development: proponents of development were able to apply more money, time, and political support to their projects, while amateurs had to cobble together resources and coalitions in basically rearguard actions.

The bill to dam Hetch Hetchy was passed in 1913, and Muir died soon thereafter—of pneumonia in 1914. It took another twenty years to get the dam built and over $100 million, which was twice what dam supporters had originally estimated. The electric power generated by the dam was illegally turned over to a private utility company, and as the opponents had predicted, the dam created an ugly reservoir that seemed an open mockery of the beauty that once existed there but now lay deep beneath the water's surface.

Although the preservationists lost this battle, it demonstrated the strength of these advocates of nature and established a precedent for the large-scale battles over wild and beautiful places that would be-

come a hallmark of the American environmental movement in the years after World War II.

Fighting for Wildlife

An important aspect of American environmentalism was the effort to protect wildlife that began in the early twentieth century. The advocates of protection for wildlife were an eclectic mixture of hunters, fishermen, ammunition and weapons producers, and northeastern nature lovers who, both together and in opposition to one another, produced a series of laws that enabled the recovery of numerous endangered species and their preservation into the future.

The creation of the Audubon Society by George Grinnell marked an important early step in trying to stem the tide of eradication of birds and animals. Although the group was created in 1886, it didn't really gain steam until 1896, when Boston activists led by Augustus Hemenway organized to protest the destruction of the southern heron's habitat. Many local Audubon chapters were quickly formed, and these groups played an important role in the first federal legislation passed for bird protection, the Lacey Act, in 1900. There were other successes, such as the new Tariff Act, which outlawed the importation of wild bird feathers into the United States. This movement became stronger over the next twenty years, although it remained mostly localized in the Northeast, and helped pass more and stronger laws protecting birds and wildlife, as well as hiring wardens to supplement state wardens whose staffs were always woefully undermanned.

The founding of the Izaak Walton League in Chicago in 1922 provided another arm to protect wildlife. Primarily made up of businessmen, middle-class Americans, and hunters who provided substantial financial support, the Izaak Walton league grew quickly through an appeal for protection of threatened species. Three members of the league's nine-man executive committee were directors of one of the largest banks in the country, and they gave substantially from their own pockets.

The group experienced exponential growth that pushed it ahead of other groups such as the Sierra Club and the Audubon Society. Although these two groups had memberships of approximately 7,000, the Izaak Walton League reached the 100,000-member mark within three years of being created. As Fox points out, "In the month of February 1924, 52 new chapters were formed; in March, another 118; in April, another 124. The local chapters in turn formed state divisions. It was a phenomenon—the first conservation group with a mass membership. Although concentrated in the Midwest, practically every state was represented."

Because of the decreased habitat resulting from the expansion of agricultural production during World War I and increased hunting, there was a precipitous drop in migratory waterfowl numbers. A debate emerged between conservationists on the best possible solution: whether to control hunting or preserve habitat.

Robert Marshall

Robert Marshall (1902–1939) was an important figure in the early American environmental movement and in formulating the idea of wilderness in American society. His background and upbringing inculcated in him a love of both nature and liberal values, such as opposition to discrimination and support for the rights of people of color. Marshall's father supported conservation interests and encouraged him to attend the Forestry School at Syracuse University. Working for the U.S. Forest Service after his graduation, Marshall, according to Gottlieb, began to "develop strong feelings about forests as a necessary retreat 'from the encompassing clutch of mechanistic civilization,' a place where people would be able to 'enjoy the most worthwhile and perhaps the only worthwhile part of life.' "

His experience in the Forest Service also compelled Marshall to emerge as a vocal critic of commercial logging practices and the impact of development on forests. His criticism echoed that of the conservationists in decrying wasteful and destructive practices, but it also sounded the preservationist note when he reflected on the beauty of nature.

Marshall is as well known for his back-country travels as for his efforts on the part of nature and society. As a young man he backpacked across the rugged Brooks Range in northern Alaska, a still remarkably remote and challenging landscape. His 1930 bestseller, *Arctic Village,* recounted his experiences in northern Alaska.

Over the course of his life and career, Marshall became a strong advocate for the preservation of wilderness areas. Like Muir, he felt that it was important to value and preserve nature for its own sake, but he also believed that wilderness could serve a useful function for American society. He was critical of the gross commercialization of nature by the National Park Service under Stephen T. Mather and worried that wilderness and its soothing qualities were not accessible to the working class. "Marshall argued that

wilderness belonged to all the people, not simply an elite who wanted such areas available for their own use. By 1925, Marshall was writing that "people can not live generation after generation in the city without serious retrogression, physical, moral and mental, and the time will come when the most destitute of the city population will be able to get a vacation in the forest."

Although given the responsibility of running outdoor recreation for the Forest Service during the New Deal, Marshall continued his implacable criticisms of both Forest Service and National Park policies and in one book argued that all forests should be publicly owned because they would then be better regulated and protected than private forests. This was in fact true. Although the Forest Service made a lot of mistakes in managing national forests, private landowners and logging companies devastated the stands of trees on their land, leaving behind devastated and heavily eroded landscapes and making no effort to remedy the destruction rendered. During the New Deal, the Forest Service acquired millions of acres of private lands that became part of the national forests and used the Civilian Conservation Corps (CCC) to replant stripped forest lands.

Through his work in the Forest Service and in the Wilderness Society, a group he helped found and financed in its early years, Marshall tried to break down the association of wilderness with elites and find ways to make parks and forests more accessible to low-income people and discriminated ethnic groups. Unfortunately for Marshall and for environmentalists, he died of a heart attack at a young age and his vision was not realized. His model of protecting wilderness while making nature more accessible to more Americans of different economic status and ethnic backgrounds may have moved American environmentalism to a more inclusive model that could have led to a stronger movement over time.

The conservation ethic was firmly ingrained in American society by the 1930s. The Sierra Club was primarily a recreational organization and adapted a conservation approach to the management of nature, an approach that was particularly that of President Franklin D. Roosevelt's administration. Raised to appreciate and love nature, he enacted numerous measures during his multiple administrations to deal with natural crises across the nation. The Olympic National Park boundaries were expanded during his tenure. The Civilian Conservation Corps, a New Deal agency that hired young men to work in numerous projects nationwide, did as much to restore nature as some activist movements. The government acquired heavily eroded private forest land that had never been replanted, and the Civilian Conservation Corps planted hundreds of millions of trees that have grown into many of the mature national forests that we see today. They also embarked on erosion control efforts, fought large-scale forest fires, and built lodges, picnic cabins, and other structures on national forest and national park lands that helped enhance the outdoor visitor's pleasure. At the same time, many state fish and wildlife agencies were making serious efforts to restore habitat as the newly born discipline of wildlife management revealed the importance of forests, brush, and grass for many species. Their efforts helped many game species to rebound in the late 1930s and 1940s. Conservationism was the dominant ethic in American environmental thinking and would remain so until after World War II.

Post–World War II Environmentalism

After World War II, the American environmental movement underwent radical changes and expanded rapidly from a basically conservative resource-oriented movement to one whose mandate increasingly included a multiplicity of perspectives and issues from wilderness preservation and protection of rivers to cleaning up toxic waste sites and protecting endangered species. In the years following World War II, American environmentalism broke away from its conservationist past and became more preservationist in outlook.

Although preservationism emerged in the early twentieth century, it never really took hold until the years following World War II and the emergence of the modern environmental movement. Following the war, the environmental movement blossomed and began a series of successful campaigns to protect rivers, canyon lands, and wild places. Samuel Hays has provided several explanations for this postwar environmentalism in his book *Beauty, Health, and Permanence: Environmental Politics in the United States, 1955–1985* (1987). According to Hays, several events converged to lead Americans to view nature in a manner radically divergent from the development philosophy of the early twentieth century. Most important, the prosperity concomitant with and following World War II, urbanization, and increasing industrialization, particularly in the Northwest, allowed Americans to view nature in terms other than economic, perceiving, instead, aesthetic and recreational values in the American landscape.

After the war Americans embarked on the high-

ways in station wagons, towing campers to visit the great outdoors. Members of the postwar generation strapped on backpacks and laced on Vibram-soled boots, venturing deep into forested mountain ranges and the heart of the desert. According to historian Paul Hirt, "in 1945 the Forest Service estimated that approximately 10 million Americans visited the national forests; in 1950 it was up to 27 million visits, in 1955 almost 46 million visits, and by 1960 the estimate had climbed to 92.5 million—a 900 percent increase overall during a period in which the total population increase was about 35 percent." The national parks experienced a similar increase in visitation. Whereas Yosemite and Yellowstone National Parks averaged between 400,000 and 500,000 visitors annually before the war, in 1955 Yellowstone had 1.4 million visitors and Yosemite, 1 million. Rising incomes, increased savings, and shorter workweeks gave families more opportunity for travel and leisure. Automobiles were more affordable, gasoline was cheap, and the highway building boom following the war made it increasingly easy for Americans to venture to distant locations for recreation and edification.

This was a period when tourism became firmly ingrained in American culture from the weekend trip to the campground on the slopes of Mt. Rainier to long summer trips cross-country to see such wonders as the Grand Canyon, Mesa Verde National Park, Acadia, and the Adirondack Mountains, among many others. Experiencing the great outdoors became an essential part of the expanding American dream. As Hays concluded, "Environmental and ecological values were an integral part of the continuous search for a better standard of living. They reflected changing attitudes about what constitutes a better life. The natural and the developed became intermingled as coordinated, mutually reinforcing aspects of the quality of living." Americans' quality of life increased and was defined by their ability to live in and recreate in spectacular and healthy natural regions throughout the country.

This ability to travel and recreate along with movement away from resource-based jobs and efforts to promote nature appreciation by groups like the Sierra Club inculcated a greater enjoyment of nature by Americans. In addition, the promotion of motorized tourism by the National Park Service—an effort that began prior to World War II—along with creation of more public spaces for Americans to visit and enjoy helped them to perceive nature as a special and even spiritual place separate from the mundane world of work and housekeeping. They increasingly saw nature as beautiful, pure, and pristine. The use of black-and-white and color photography in the growing environmental movement was critical for generating support of environmental goals. According to Hays, photographs were essential to maintaining memories of visits to beautiful natural places as well as generating support for these sites by those who had not visited them. Organizations such as the Sierra Club and Friends of the Earth employed these photographs, most famously the stunning images created by Ansel Adams, to inculcate a preservationist ethic in Americans. Hays writes that "visual images stirred the imagination of many Americans who had not visited natural places in person, and these images were important in the political drive to establish national wilderness areas and especially the campaign to manage significant areas in Alaska as natural environments."

Accordingly, even those unable to travel to parks and monuments, or able to go only rarely, treasured nature as something special and removed from an increasingly urbanized and commercialized American society and deserving preservation and protection. Many Americans grew increasingly supportive of environmental goals; they sought to preserve "nature" from development and destruction, as is indicated by the widespread opposition to the construction of the Echo Park Dam in the Dinosaur National Monument and support for the 1964 Wilderness Act.

The new love for nature and dedication to preserving wild places was clarified in the Echo Park Dam battle in the 1940s and 1950s. The Echo Park Dam battle emerged as a central, defining event in the postwar environmental movement. The Dinosaur National Monument lies astride the Wyoming and Utah border and includes stunning desert terrain and rivers as well as a wonderful collection of dinosaur fossils. The federal Bureau of Reclamation announced its intention to build a ten-dam water storage system, beginning with a dam on the Green River within the boundaries of the Echo Park Monument. Agency officials must have been surprised by the hornet's nest of trouble they stirred up with these plans.

In general, the environmental movement in the post–World War II years took on a more preservationist agenda as environmentalists fought battles to protect scenic, grandiose river canyons, fought for legislation to set millions of acres of wild lands aside as wilderness, and staked new ground in the fight to protect the environment. Numerous historians pinpoint the fight over the Echo Park Dam as a pivotal

event in the emergence of the post–World War II environmental movement.

The dam was to be located inside the Dinosaur National Monument and would have flooded the beautiful river valleys of the Yampa and Green rivers; stunning desert terrain and riparian habitat would have been drowned under the proposed reservoir. The Bureau of Reclamation planned this dam as part of a ten-dam water storage project and anticipated following the Echo Park Dam with yet another within the national monument. This plan arrived at the tail end of a frenzied period of dam building throughout the West, and the bureau likely anticipated little opposition for a project so integral to economic development and so nationalistic in nature. The Sierra Club and Wilderness Society, under the leadership of David Brower and Howard Zahniser, organized a well-orchestrated attack on the Bureau of Reclamation's plans. With the support of Wallace Stegner and Bernard DeVoto, environmentalists garnered widespread national support for their efforts to block the dam. This contrasts markedly to the regional focus of the battle against the Lower Snake River dams occurring simultaneously. As historian Mark Harvey writes, "Numerous articles appeared in conservation journals, including the *Living Wilderness*, the *National Parks Magazine*, the *Sierra Club Bulletin*, and *Planning and Civic Comment*." It was also important that well-known writers like Stegner, a novelist, historian, and essayist, and DeVoto, a historian and essayist for the *New Republic,* embraced the fight, and their writing gained the effort a nationwide audience.

Obviously, many factors came into play, such as a strong national media and emerging environmental ethic, but nationwide support was probably the key to victory in the Echo Park battle. At the same time, another battle was occurring to protect the Lower Snake River in Washington State from four dams proposed by the Army Corps of Engineers. The failure of the ten-year effort in the Pacific Northwest was due primarily to the conservationist focus of those seeking to protect salmon runs: fish biologists, fishermen, and so on. A fundamental shift occurred in Echo Park, where preservationism as a part of American environmentalism attains dominance. This is also a fundamental difference from the battle to block the Lower Snake River dams. That effort never moved beyond its regional focus. Furthermore, the fact that Echo Park was located in a national monument and the Lower Snake River was not also helps explain the different results in the two battles. Dam opponents could appeal to strong feelings of nationalism and employ the argument of protecting a national treasure. Although the Lower Snake region is beautiful, it doesn't compare with the dramatic scenery of Dinosaur. Furthermore, it was not a part of the national park system.

There was another significant difference between the efforts to stop the Lower Snake River dams and the Echo Park battle. According to Harvey, a specific new strategy was key to the activists' success:

> The Dinosaur battle could not be won by appeals to science alone . . . defenders of Dinosaur realized that they must appeal to a broader segment of the public and link the preservation of the monument with a new generation's appetite for recreation. Americans were hungry for an experience in the outdoors and eager to taste the wilderness. Dinosaur offered a landscape of breathtaking beauty that had the potential to draw such people. First, it must be made known by advertising its scenic wonders . . . it required poetry and pictures and films—in this case of the winding, twisting canyons and rivers of an obscure national monument in a remote corner of the American West.

In *Beauty, Health, and Permanence,* Hays argues that prosperity and structural economic changes enabled Americans to become environmentalists. Increased discretionary income allowed the means to travel and engage in tourism, visiting places like Yellowstone and Yosemite. With the economic freedom to visit these places of beauty and inspiration, a greater proportion of Americans found themselves emotionally attached to these natural/national monuments and began to think in environmentalist terms. Structural changes such as the increased movement away from a resource-extraction-based economy to more service and manufacturing jobs enabled Americans to see nature as a recreational space rather than a source of income and livelihood. Forests could be seen for their trees rather than their board-feet, mountains for their glittering streams, craggy peaks, and glaciers rather than the precious ore they might contain. Not being directly dependent on nature's resources for survival enabled Americans to increasingly view nature in preservationist terms.

The increasing focus on recreation also played an important role in the emerging environmentalist movement. The increased popularity of a variety of outdoor recreations such as hiking, camping, and touring introduced a greater number of Americans to the scenic landscape of their country and rendered them more susceptible to the appeals and publicity of

environmental groups such as the Sierra Club in the postwar years. Visits to national parks and the forests increased dramatically in the prosperity of the postwar years. The healthful benefits of exercise such as hiking also played into Americans' increasing outdoor recreation, seeing national parks and forests as recreational areas where they could enjoy the aesthetic pleasures of nature as well as hiking, camping, fishing, and boating. Interestingly, supporters of the proposed Echo Park Dam recognized the increasing interest in outdoor recreation and characterized rafting the Green River as dangerous in pro-dam rallies in an effort to undermine the recreational aspects of the river.

This interest in and increased love for nature were facilitated and strengthened by the Sierra Club and other environmental groups. The Sierra Club used images like those created by Adams to capture the beauty of places like Yosemite in winter, capitalizing on the monumental in nature, as Alfred Runte refers to it, to build support for their environmental program. These pictures helped create a love for place and sense of loyalty for those who had spent time in the parks, mountains, deserts, and forests and even evoked feelings in those who were unable to travel to those places, but saw the beauty in them through images produced by environmental groups. Both Hays and Runte speak of the nationalistic feelings generated by images of monumental sites such the Grand Canyon, Niagara Falls, Yosemite, and other grand places. These feelings helped create a constituency for environmental legislation and were vital to the environmentalism of the late twentieth century.

Beautiful pictures were used in the Echo Park fight to generate mainstream support for blocking the dam. *This Is Dinosaur: Echo Park Country and Its Magic Rivers* (1955), edited by Stegner, was, according to Harvey, the beginning of the large-format book tradition of the Sierra Club that Hays finds so integral to the success of the environmental movement in the second half of the twentieth century.

Appealing to a nationwide audience propelled the issue from the West to the attention of Americans across the country. The writings of both Stegner and DeVoto were integral in creating a constituency for national parks and wild places in general and Dinosaur specifically. According to John L. Thomas,

> DeVoto went on record in July 1950 in determined opposition to the Echo Park Dam project, first in two "Easy Chair" columns and, more prominently, in the *Saturday Evening Post*, which had a circulation of more than four million. "Shall We Let Them Ruin Our National Parks?" was widely read and stirred nationwide interest in park preservation when a condensed version appeared in the November issue of *Reader's Digest*. The article, which was DeVoto's first and last appearance in the pages of the *Post*, opened the conservationist assault on the Army Corps of Engineers and the Bureau of Reclamation as the two most dangerous enemies of parks and forests in the country.

The Bureau of Reclamation came under heavy attack and, settling on an alternative dam site in Glen Canyon (to the environmentalists' later regret), abandoned the proposed dams in Dinosaur National Monument. This victory marked the emergence of the postwar environmental movement. The Echo Park Dam battle emerged as the biggest preservationist battle since Hetch Hetchy and, with victory, as a turning point for the emerging environmentalist movement. Robert Gottlieb points out an important element of the Echo Park battle. "The Dinosaur fight served to distinguish between those conservationists still wedded to reclamation and other multi-use projects and those groups such as the Sierra Club and Wilderness Society that sought to recapture their preservationist or protectionist roots by emphasizing the need for protection."

Creating Wilderness

The wilderness movement emerged directly from the successful opposition to the Echo Park Dam. Revitalized by their organizing efforts, the Sierra Club under Brower's leadership and the Wilderness Society under Zahniser's guidance immediately began working toward the vision of preserving vast tracts of wilderness that was pristine or close to that state. This vision also represented a resurgence of a preservationist ethic in environmental circles. Activists would begin working on a project that would have warmed the heart of Muir, an effort to set aside countless millions of acres of wilderness for protection from human use.

The wilderness advocates were borne forward on the shoulders of a generation of Americans who had fallen in love with wild places and increased their visitation both by car and on foot.

The Wilderness Movement differed significantly from earlier environmental efforts in that it applied a general principle and sought to protect vast areas of land across the country instead of fighting a battle over a particular location. They would no longer sit back and fight to protect threatened places but rather would take the offensive and put lands off-limits per-

manently by assigning them wilderness status. During the 1960s, many organizations concerned with the protection of wild nature experienced rapid growth. What had once been considered marginal, the preservationist approach, became a central tenet of the American environmental movement as groups like the Sierra Club, the National Wildlife Federation, and the Wilderness Society grew in membership and power. They also played critical roles in expanding parks, protecting more natural sites, and expanding and solidifying the role of environmentalism in American culture.

The plan to create a national wilderness system followed quickly upon the victory at Echo Park at Zahniser's initiation. This early effort to preserve 160 national important wilderness sites reflected a change in the American environmental movement. It took seven years to fashion the final wilderness bill and gain its passage. In that time, there were nine separate hearings, and the bill went through significant modifications as the debate continued among wilderness preservationists and those with resource interests, government agencies, and advocates of mechanized outdoor recreation who worried about access to wilderness playgrounds.

After decades of conservationists and their multiple-use mandate setting the terms for environmental action, the limitations that would be imposed by wilderness designation seemed onerous to miners, loggers, professional foresters, and others. There was some agreement that the idea of wilderness protection was valid, but opponents worried about access and the process by which land would be designated "wilderness." In response, wilderness advocates assured their opponents that this program would not "remove" land and resources but would give official sanction to land that was already effectively managed as wilderness. Moreover, they argued that the system would never amount to more than 50 million acres, that is, 2 percent of the nation's landmass, hardly a dire economic impediment.

Congressional testimony on the bill from the 1950s through 1964 revealed the legacy of romanticism and wilderness ideas in American culture, proving the importance of the ideas held by people like Emerson, Thoreau, Muir, Leopold, and others in crafting an idea of wilderness and its worth for nature's and human's sakes. The chairman of the Committee on Interior and Insular affairs, Senator Clinton P. Anderson (D-NM), referred back to his interactions with Leopold forty years earlier as the reason for his current support of the wilderness bill, enacted in 1964. In his support of the bill, Secretary of the Interior Steward L. Udall emphasized ecology and the idea of the land ethic and also referred to Leopold as an important figure in the wilderness movement. Other key figures mentioned the writers and ideas that influenced their worldview and helped provide the foundation for the wilderness philosophy. In 1958, Senate hearings in several western states generated the mailing of 1,003 letters in favor of the wilderness bill and a mere 129 in opposition.

The wilderness protests and the opposition to the proposal to build dams in the Grand Canyon did not arise in a cultural void but were rather part of a larger cultural conflict that increasingly questioned assumptions about American life and values. The same generation that protested the Vietnam War and fought for civil rights saw a value in the preservation of wilderness. A culturewide critique of corporate society, of materialism, of success at any cost supported the converse, an idea that nature has a value of its own, outside of human economic and material needs. Furthermore, wilderness would be a place that would always remind people of the way nature once was and would provide a sanctuary for contemplation as well as recreation. The 1960s and 1970s were decades of protest, and the effort to pass a wilderness bill was part of that general movement.

Aldo Leopold and the Wilderness Ethic

Aldo Leopold (1887–1948) is well known among environmentalists for his collection of essays titled *Sand County Almanac: And Sketches Here and There* (1949), which was written toward the end of his life and published posthumously after numerous rejections. This collection articulated a new land ethic that declared the need for a human value system that prized habitat, land, and the protection of nature. Leopold is perceived as important today, particularly with regard to the wilderness movement, for articulating the need for a land ethic and for protecting wild places. In so doing, he helped propel an idea of nature that had been gaining in strength and coherence since the writings of Thoreau.

Leopold began his career as a classic conservationist. Growing up in the rural countryside of Wisconsin, he loved hunting and fishing and carried that love into his career in wildlife management. His first approach was to remove as many predators as possible in order to increase deer populations, the favorite target of American hunters in the early twentieth century and a species in many states that seemed on the edge of disappearing. But his approach changed

as he realized that eradication of predators had the opposite effect that was originally intended. The growth in the deer population created a larger deer population that was unable to live off the land, and thus, due to starvation, the species became weaker and died off.

Leopold was at the center of a new era in wildlife management and helped create the field of wildlife management as an academic discipline. His work and the work of others in the field such as Olaus Murie and Rudolf Bennitt at the University of Missouri stressed the importance of habitat to the success of species survival and prosperity. Their studies of wildlife populations emphasized the role of the loss of habitat as well as poaching and market hunting in the devastation of numerous species such as deer, wild turkey, and other species. Deer harvests in Missouri in the early 1930s were around 100 a year. Compare that to over 230,000 deer in 2001. Deer, often considered a nuisance today in many suburbs and on many highways, were close to extinction in many parts of the country in the 1930s. Other species such as wolves, bears, cougars, and bobcats continued their precipitous decline both from habitat loss and from government-sponsored bounty programs. While achieving success in his career, and seeing through the birth of the nascent wildlife biology movement, Leopold continued to work toward a more radical vision. His writing of the essays that compose *The Sand County Almanac* provided an important piece of the puzzle for American environmentalists moving toward a wilderness philosophy.

Man-Made Environmental Dangers

The shift in and expansion of American environmentalism was predicated on Americans learning to view the world in ecological terms. The idea of ecology was popularized with the publication of Eugene Odum's textbook, *Fundamentals of Ecology*, in 1953. Building on the earlier work of other ecologists and scientists, Odum created a model of analysis based on the ecosystem, "any entity or natural unit that includes living and nonliving parts interacting to produce a stable system in which the exchange of materials between the living and nonliving parts follow circular paths." Implicit in this textbook was an assertion of the fragility of ecosystems and the capability of humans to destroy ecosystems.

This textbook was published during the golden era of chemicals and synthetics. In what agricultural economists have termed the Green Revolution, chemical insecticides, herbicides, and fertilizers fueled an explosion in American agricultural production in the years following World War II. DDT was one of those miracle chemicals. It had been effectively employed in the 1940s to kill mosquitoes worldwide and, for a while, stop the spread of malaria, almost eliminating the disease in many countries. Farmers also used it to reduce insect populations that fed on their crops.

Rachel Carson had long been aware of the impacts of pesticides on nature, and the reports of massive bird dieoffs as a result of DDT inspired her to write a warning to the human race, *Silent Spring* (1962). When she began to conduct research for her book, she realized the situation was worse than she had thought—that in fact, pesticides were causing a great deal of environmental damage. Carson knew her critique could have significant impacts and that the petrochemical industry would not take her attack lying down.

Historians have located the publication and public response to Carson's *Silent Spring* as the major turning point in the emergence of a vibrant environmental movement in the 1960s. This book testified to the destruction being wrought by chemicals, specifically DDT, on the natural world. *Silent Spring* painted a picture of a world greatly reduced by the excesses of human activity but also human health in the balance. Carson's book helped stimulate the environmental fight against chemical poisons in the environment.

Attacks on Carson originated from the chemical industry as well as the general media. These attacks often questioned her scientific "objectivity" and accused her of mysticism. The criticisms were also gendered. Attacks came not only from the defenders of the capitalist status quo but from potential allies as well—some members of the Sierra Club were disturbed by the new book. This seeming conflict speaks to the tension in the environmental movement among various agendas. Carson's powerful work eventually gained a wide following and proved important in the environmentalism of the 1960s, educating Americans to the dangers in the air and water to nature and to themselves. As Donald Worster points out, *Silent Spring* represented more than an alarm about the dangers of DDT. It also spoke of the "need for ethical change, away from a spirit of conquest and a respect for all forms of life and an acknowledgement of our dependence on them." Historian Vera Norwood argues that, although many historians have acknowledged the importance of *Silent Spring* in the emergence of the environmental movement of the 1960s and 1970s, they have generally ignored Carson's

RACHEL LOUISE CARSON (1907–1964)

Born in Springdale, Pennsylvania, on May 27, 1907, Rachel Carson early developed a deep interest in the natural world. She entered Pennsylvania College for Women (now Chatham College) with the intention of becoming a writer but soon changed her major field of study from English to biology. After taking her bachelor's degree in 1929, she received her M.A. in zoology from Johns Hopkins University in 1932. In 1931, she joined the faculty of the University of Maryland, where she taught for five years. From 1929 to 1936, she also taught in the Johns Hopkins summer school and pursued postgraduate studies at the Marine Biological Laboratory in Woods Hole, Massachusetts.

In 1936, Carson took a position as aquatic biologist with the U.S. Bureau of Fisheries (from 1940 the U.S. Fish and Wildlife Service), where she remained until 1952, the last three years as editor in chief of the service's publications. An article in the *Atlantic Monthly* in 1937 served as the basis for her first book, *Under the Sea-Wind*, published in 1941. It was widely praised, as were all her books, for its remarkable combination of scientific accuracy and thoroughness, with an elegant and lyrical prose style. *The Sea Around Us* (1951) became a national best seller, won a National Book Award, and was eventually translated into thirty languages. Her third book, *The Edge of the Sea*, was published in 1955. These books constituted a biography of the ocean and made Carson famous as a naturalist and science writer for the public.

Her prophetic *Silent Spring* (1962) was also a best-selling book, creating a worldwide awareness of the dangers of environmental pollution. In it she challenged the practices of agricultural scientists and the government, and called for a change in the way humankind viewed the natural world. She urged that pest control not be abandoned and that more research be undertaken to enable pesticides to be used safely and to find alternate techniques for pest control. Carson died at her home in Silver Spring, Maryland, on April 14, 1964, before she could see any substantive results from her work on this issue. In 1969, the U.S. Department of the Interior named the Coastal Maine Refuge the Rachel Carson National Wildlife Refuge.

James G. Lewis

other significant contributions to the environmentalist attack on pollution.

Carson had already had popular success before *Silent Spring* with the publication of *The Sea Around Us* (1951) and as a result had in place a constituency of women who wrote to her asking for advice on nature writing, looked for her support on environmental issues, and awarded her for her writing and work. In fact, according to Norwood, it was women who supported and sustained Carson during the early years when industry-paid scientists and conservative defenders of the petrochemical industry mercilessly hammered at Carson's conclusions and launched vitriolic personal attacks against her. National women's organizations played a pivotal role in supporting Carson and helping to spread her message. Groups like the National Council of Women, the Garden Club of America, and the American Association of University Women provided recognition of her message when she suffered the slings and arrows of industry and science's attacks.

Furthermore, women conservationists, particularly in the Audubon Society, were also concerned about the health of wildlife and played an integral role in conveying the central message of *Silent Spring.* In fact, Norwood argues that Carson believed that women served a special role in transmitting cultural values regarding nature to young generations. She felt that beyond that women needed to find a way to turn those values into action and recognized that women's groups could serve that function.

Other works of literature contributed to the movement that emerged during that decade. Writers such as Herbert Marcuse and Murray Bookchin provided critiques of modern society and arguments for the need to reconstruct an industrialized capitalist society on stronger ecological terms.

In the 1960s and 1970s, Americans increasingly understood the scale of environmental destruction surrounding them. Books like those written by Bookchin and Carson articulated a critique of capitalism and a culture of consumption, waste, and overdependence on technology. As the theories of ecology were popularly expressed and understood, it became increasingly clear that not only were humans rendering extensive damage on organisms at all levels but also that humans were suffering from their own worst polluting excesses. The increased use of chemicals, air pollution, and atomic bomb tests introduced toxics into physical systems that presented an increased and frightening threat to nature, including people. Samuel Hays clearly characterizes the understanding of the

spreading environmental catastrophe, writing about the spread of "toxic agents" so that they could be found almost anywhere floating in the air, in the water, and salted in the soil. Before it became popular to talk about the world as a global village, people were beginning to understand the scale of environmental destruction and pollution and its extended reach as lead produced in cities was found in the glaciers of the Antarctic and Greenland and radioactive iodine from the atomic bombing of Hiroshima and Nagasaki at the end of World War II showed up in the lichens of Alaska. The distribution of the ecological threat was demonstrated in examples such as these.

The atomic age propelled its own form of terror into the consciousness of Americans. Fallout from atomic weapons testing both at Bikini Atoll and the secret tests in Nevada is central to the emergence of environmentalism in America. One can argue for prosperity and the popularization of ecological ideas in the mainstream, but the seemingly unlimited power unleashed by science in the form of atomic bombs and the ecological ramifications of atomic weapons testing created a deep-seated unease in Americans, even in a time of cultural conformity, that often bordered on terror.

In 1958, a group of scientists at Washington University in St. Louis began publicizing information about radiation fallout from atomic testing in Nevada. This effort spread to groups organized around the country. After passage of the 1963 agreement to limit above-ground testing, members of the St. Louis Committee and scientists in general focused their efforts on publicizing the dangers of chemical pesticides and opposing their use. One of the leaders was plant physiologist Barry Commoner, who later inserted himself into the debate over population growth and participated in the environmental movement. Scientists from other disciplines increasingly joined this campaign.

This trend marks a strong environmental movement to combat various types of pollution in the environment, cognizant that excesses in science and industrial development threatened humans as well as birds and fish. Incidents like the burning of the Cuyahoga River in Ohio symbolized the extent to which the human/nature relationship had gone wrong. Continuing threats to human health strengthened the idea that people were at risk and led to greater protest.

Love Canal stands as one of the strongest examples of this model of this form of environmentalism even as millions of Americans continue to fight chemical pollution in their own backyards. A new housing complex was built along a toxic waste site outside Niagara Falls, New York, in the mid-1970s. The homeowners who put their savings into these new homes were not informed of the waste site. The construction of an elementary school on top of the covered dump led to a rapid increase in various illnesses among schoolchildren. Children suffered from various ailments such as asthma and other respiratory problems. The community in general experienced a significant rise in rates of cancer, birth defects, miscarriages, liver ailments, and nervous system disorders. Local residents, led by Lois Gibbs, organized in an effort to gain support from the state even as toxic wastes drained into their basements and surfaced in backyards, and children burned their feet walking across lawns. Angered at state government indifference to their plight, local community members organized the Love Canal Homeowners' Association (LCHA), which forced the state and federal government after years of stalling and halfway measures to agree to provide funds to Love Canal homeowners for home purchase and relocation. They effectively used environmental groups and scientists to strengthen their arguments and educated themselves on complex issues, but the community residents themselves organized strategy and decided that the dump site itself would have to be purchased as the only reasonable solution to their horrible situation.

This was only the beginning of the battles that would take place over industrial pollution in communities across the country. The exponential increase in environmental group enrollment and the ecological dangers understood by Americans led to transformative legislative changes. The creation of the Environmental Protection Agency (EPA) in 1970 represents the effort to curb the worst excesses in pollution. The Endangered Species Act (ESA), passed in 1973, also reflected the growing American consciousness that something was terribly amiss in Americans' relationship with nature and an increasing recognition that other species deserved some status, some right to actually exist in spite of human economic interests. The force of law embodied in the Endangered Species Act (ESA), though not always fully applied in later years, would restrict the scale of development and resource extraction activities and its corresponding impacts on species ranging from darter fish to bald eagles.

One can view the ESA as the culmination of the environmental movement, a statement that preservation of various species, regardless of majesty or economic value, should trump development and economics. In *The Rights of Nature: A History of Environmental Ethics* (1989), Nash writes that the ESA "ex-

emplified efforts to modify human contact in the interest of the rights of other species." Although the vision of the Endangered Species Act has not been completely realized, the act has played an important role in preserving several species such as the bald eagle and has slowed the decline of salmon and steelhead in the Pacific Northwest. The ESA has been the lever to force discussion and some measures to preserve salmon in the Columbia and Snake River system and therefore is important. But do agencies really follow the letter of the ESA, and how have they failed in their mandate to preserve endangered species?

Other important legislative changes resulted from the increasing environmentalism of Americans in general and have improved nature and the American quality of life over the years. The Clean Water Act and the Clean Air Act both imposed regulations on industry that have returned many rivers to a state that, while not pristine, is much healthier than it was thirty years ago. Industrial rivers like the Kennebec in Maine and the Cuyahoga in Cleveland (which actually caught on fire on more than one occasion) were once seen as industrial sewers, with no aquatic life and dangerous to human health. These rivers and many others like them are much cleaner and are once again healthy river ecosystems.

Human Population Growth

The effort to curb population growth has also been an important part of American environmentalism. The exponential growth of human populations worldwide puts habitat at risk, generating excessive consumption and waste of natural resources and contributing to human famines and social chaos. Population growth is a more complex issue than conservation and preservation because it necessarily involves problematic cultural and religious values as well as economic problems.

William Vogt's *Road to Survival* (1948) launched an attack on the human population problem. His book announced that the U.S. population of 147 million (it is roughly 275 million now) was excessive and that Americans were self-indulgent and consumed too much of the world's resources. Vogt also singled out the automotive industry and car culture for attack as wasteful of natural resources and destructive of human culture.

This book was very popular and was followed by a government commission in 1952 chaired by William Paley, the president of Columbia Broadcasting System. This panel declared its agreement with Vogt's conclusions that the U.S. population should grow more slowly and consume less. But in an era of prosperity and growth, little else happened in this area following these developments. The population problem would again become a major focus in the 1960s as environmentalism spread and became more popular and included more approaches.

A now famous debate emerged when Commoner, environmental researcher, activist, and politician, attacked a casual comment made by Paul R. Ehrlich—a Stanford University biologist and author of *Population Bomb*—calling for compulsory birth control. Commoner felt that the population control movement was politically and socially repressive, and he argued that by giving people more opportunities and education, much more progress could be made in reducing human population growth, an approach that since then has been proven to be correct. Their argument grew increasingly heated when each accused the other of manipulating statistics, and the argument continued for a while. It is one of the more troubling debates because, although human population is clearly the cornerstone of many environmental problems in a fundamental way, political repression, the cornering of resources by a small minority of the world population, and poverty all contribute to both human population growth and worsening environmental problems. In fact, over time Ehrlich came to accept some of Commoner's arguments, acknowledging that other factors must be considered as well.

The debate over population growth and increasing concern over that issue led to the creation of a group called Zero Population Growth, which continues to devote its energy to combating world population growth.

Nuclear Power

Nuclear power was once seen as a clean energy source for the future, but Americans' increasing ecological awareness, as well as the fear triggered by both atomic weapons testing and incidences of radiation poisoning, made Americans distrustful of expanding dependence on nuclear power in the 1960s and 1970s. American society's growing sense of unease was also fueled by the social unrest created by the divisions surrounding the Vietnam War. The antiwar divisions of the 1960s and 1970s undermined Americans' faith in government and experts, and the expansion of activist groups in the civil rights movement and environmental issues paved the way for an expanding antinuke movement.

Early protest against nuclear power centered on issues of waste, and by the 1970s the opposition to

nuclear power included concern over accidents and their consequences. Some nuclear physicists and engineers joined the effort, arguing that the Atomic Energy Commission (AEC), which was the governing and regulating federal agency, was entirely too friendly and lenient to the industry, thereby making the danger of potential accidents higher than necessary. The creation of the Union of Concerned Scientists at the Massachusetts Institute of Technology in 1971 increased the level of opposition to the nuclear power industry and also increased the credibility of the movement. The defection of the scientists and engineers did not stop there. According to Hays, "some engineers who had been employed in nuclear facilities, both private and public, resigned their posts to join citizen groups to help press these concerns; three of these engineers were from the General Electric Corporation and two were from the AEC. Their technical expertise enabled the citizen antinuclear movement to participate effectively in the varied administrative proceedings pertaining to the safety of nuclear energy."

These defectors used their expertise to predict the possibilities of nuclear meltdowns and radiation fallout, which was much grimmer than the somewhat more optimistic predictions of the AEC. As a result of these attacks, in 1975 the AEC required new plants to include an emergency cooling system in order to prevent meltdowns of the reactor core.

Direct action protest groups dramatically changed the antinuclear power movement in the mid-1970s. In 1974, a man in northwest Massachusetts knocked down the tower of a local utility in order to protest its plans to build a nuclear power plant. This action attracted other determined opponents and helped radicalize the movement. Inspired further by the successful German efforts to block a nuclear power plant by use of massive sit-in protests, New England antinuclear protestors organized themselves into a group called the Clamshell Alliance.

In August 1976, following the successful German model, members of the Clamshell Alliance sat in at the site of the proposed Seabrook Nuclear Power Plant in New Hampshire. Within a few weeks another 180 protesters joined the original eighteen. As Gottlieb writes, "These events electrified the antinuclear movement, with the occupation capturing the imagination of antinuclear groups around the country. The action of the Clams, as they were called, also helped coalesce with respect to the nuclear issue constituencies with roots in the New Left and the counterculture who had been largely dormant since the 1960s." Another protest in 1977 drew 2,400 activists and generated massive press coverage that left activists unsatisfied with their coverage of the nuclear power issue.

The Clamshell protests paved the way for further action by more direct action groups such as the Abalone Alliance, which protested the construction of the Diablo Canyon Power Plant on the California coast in the late 1970s. They were able to accelerate protests by focusing on the existence of a fault line at the proposed location, suggesting the possibility of an earthquake under a nuclear power plant, and by escalating to the use of civil disobedience.

Criticism of nuclear power continued but accelerated exponentially in the wake of the Three Mile Island incident in 1979. A combination of mechanical breakdowns and human error nearly resulted in a meltdown, eerily echoing the motion picture *The China Syndrome* (1978), in which the nuclear power industry is portrayed as dangerous and using violence to cover up a meltdown. In the real-life case, at the Metropolitan Edison Company Nuclear Reactor Three-Mile Island in Pennsylvania, meltdown was avoided, but a small amount of radiation was released into the atmosphere, resulting in local evacuations and near panic.

This near meltdown undermined the nuclear power industry's promises of safety and provided evidence for the dire predictions of the opponents of nuclear power. Thus, the era of nuclear power development in United States history slowed dramatically.

Robert Gottlieb details some of the protest that arose:

> Like the Clamshell Alliance, the Abalone Alliance was able to attract enormous attention for its protests, particularly in the wake of the Three Mile Island accident . . . and the release of the film *The China Syndrome*. . . . Between April and June 1979, several major Abalone protests took place. These included a demonstration involving more than 25,000 people in San Francisco, the picketing of ninety-three different offices of PG&E (the utility constructing the facility) throughout the state, and a local demonstration in San Luis Obispo that started out at the movie theater playing *The China Syndrome* and ended at the local PG&E office. Those events culminated in the largest anti-nuclear protest at the time, as 40,000 people gathered in San Luis Obispo on June 30 to hear rock music, proclaim their support for alternative energy, and vow to stop Diablo.

Opposition to uranium mining arose as well. High rates of lung cancer among uranium miners and the abandonment of contaminated mine waste in tailing piles and retaining ponds generated anger and opposition. Furthermore, tailings from mines were used in the landfill of new homes in Grand Junction, Colorado, exposing homeowners pursuing the American dream to high levels of radioactivity. In other communities, there were incidents of radioactive tailings that were left exposed or that leaked into groundwater supplies.

Strong opposition to uranium mining in Vermont in 1980 resulted in referendums in thirty-nine towns, thirty-seven of which decided to ban uranium mining. Soon after that, a county in South Dakota voted to ban uranium mining on its land, and in 1981 the New Jersey Legislature passed a seven-year moratorium against the practice. The push for nuclear power lost its support; even in the face of threats to oil overseas in the early twenty-first century, few voices have called for a return to development of nuclear power.

Greenpeace

Greenpeace was initially organized by Canadian and American antinuclear activists to protest nuclear weapons testing in Alaska. It gained much fame in 1973 when the skipper of a Greenpeace boat sent to protest French nuclear weapons testing in the South Pacific was filmed being beaten by soldiers. Greenpeace expanded its range in the mid-1970s when it adopted a deep ecological approach, trying to protect all species of nature. In this period, Greenpeace focused on the protection of sea mammals such as whales and seals. According to Nash in *The Rights of Nature* (1980):

> The mammals' welfare had first drawn environmentalists' concern in the late 1960s, when Montreal-based Artek Films documented the Labrador seal hunt for the Canadian Broadcasting Corporation. The film's intent was to portray stalwart hunters carrying on an age-old frontier tradition. But this was the 1960s, and what many Americans as well as Canadians saw was incredible brutality against cute, defenseless creatures. Controversy flared in the media, and Brian Davies, a Canadian humanitarian, along with the New York author Cleveland Amory, organized a massive protest.

Davies and others believed that these animals had the right to live and that the only response, like the earlier response to slavery, was to end the hunt. By organizing boycotts of Canadian marine products, anti–seal hunt activists were able to almost completely end the seal hunt by the middle of the 1980s.

On July 21, 1994, members of Greenpeace rappel down the World Bank building in Washington, D.C., after unfurling a sixty-foot banner protesting the bank's lending policies. Activists claimed that the policies of the World Bank, founded in 1944, promoted pollution and environmental degradation. *(AP Wide World Photos)*

In their protests against sealing and whaling, Greenpeace activists adopted the Quaker practice of nonviolently witnessing acts of injustice. Confronting Russian whalers, photographing the whale hunts, and a Greenpeace member's chaining of herself to a harpoon helped to build the popularity of Greenpeace and raise not only their U.S. but also their worldwide profile. In July 1985, a French operative bombed and sank the *Rainbow Warrior* while it was docked in Auckland, New Zealand, killing one crewmember. Although Greenpeace gained greater popularity because of this incident, it challenged its nonviolent ethic. The actions of one member of the group, a Canadian named Paul Watson, contributed to the further radicalization of the movement, involving many American as well as other nationalities. Having led the anti-whaling efforts directed against the Russians, Watson stepped up his commitment against the har-

vest of seal furs. He and other members of Greenpeace used helicopters to observe and photograph "seal pups being skinned alive in front of their distressed mothers." They turned to spraying dye on the furs in order to render them worthless; then Watson began trying to protect the pups by covering them with his own body. The result was a beating and dousing in the cold waters by the fur harvesters. He was left unconscious on the ice.

After being cast out of Greenpeace for violating Canadian laws, Watson formed a new, more radical group, the Sea Shepherd Conservation Society. With a 200-foot ship in his Sea Shepherd navy, Shepherd and his international crew continued their opposition to seal and whale hunting and generated a good deal of popular support. They also targeted Russian whalers, opposed the extermination of wolves in British Columbia, and in one particularly newsworthy event that propelled them into household knowledge around the world, they sabotaged a whale processing station and sank two empty whaling ships in Reykjavik, Iceland, in 1986. This cost the whaling industry $4.6 million and reflected Watson's belief that destruction of property was legitimate in the defense of nature. The right of an organism to exist, in other words, could not be legislated away.

The movement clearly continued to radicalize over the last half of the twentieth century, even as the mainstream organizations like the Sierra Club and the Wildlife Society increased in strength and size and seemed to represent more moderate environmental positions.

Nash has argued that American environmentalism has expanded its reach over the last 100 years, that what has occurred in this movement, corresponding with other events in American history like women getting the vote and the civil rights movement, is the expansion of rights in American society. From a constitution that declared political rights for a limited group, white male property owners, political reform and social dissent have consistently compelled the expansion of the original document not only to include more people in American society that were originally excluded but also to move beyond the species to consider, as he says, "the rights of nature."

Environmentalism During the Conservative Ascendancy

With Ronald Reagan's presidency began an era of politics that eroded the liberal welfare state that had been constructed from the New Deal through Lyndon Johnson's Great Society. Similarly, the Reagan administration launched multiple attacks on the environmental policies and safeguards in a backlash against the environmental era and its successes. Reagan entered office clearly bent on rolling back environmental policies and regulations in order to help businesses and the wealthy. In this interest he took advice from conservative think tanks like the Heritage Foundation and the American Enterprise Institute as well as from pro-business and anti-environment organizations like the U.S. Chamber of Commerce. Reagan filled his administration with ideologically like-minded representatives. The new secretary of the Interior, James Watt, best exemplified the administration's anti-environment philosophy. This was only the beginning. His administration read like a conservative corporate roll call. The general counsel of the Louisiana-Pacific Corporation, the U.S. Forest Service's largest logging customer, became the assistant secretary of agriculture, placing him and corporate interests in direct control of the U.S. Forest Service. Anne Gorsuch, a leader of the Republican Party's right wing in the Colorado legislature, took over as the new administrator of the EPA, and a Colorado rancher and state legislator was appointed director of the Bureau of Land Management. There were many other appointments of this nature, and those most critical of environmentalism were delegated the authority to legally roll back decades of environmental progress and protection.

A supposed free market advocate and a dedicated opponent of environmentalists, James Watt embarked on an effort to turn back decades of environmental progress. He gained a great deal of conservative support, particularly from those conservatives and landowners in western states associated with the "sagebrush rebellion"—an effort to remove the federal government from the control of land within western states like Nevada and Idaho. Ignoring the now well understood and long western tradition of dependence on federal government funds and intervention, these anti-environmental conservatives and many state politicians now demanded that federal land be turned over to the states to be managed and controlled at the state level, for economic use, in disregard of "oppressive" federal environmental laws. The Departments of Interior and the EPA were reduced greatly in staff and budget during the Reagan administration.

Part of the Reagan administration philosophy was to cut or at least limit budgets for agencies with en-

vironmental missions as well as creating a milieu of lax enforcement of environmental laws.

The extremism of the conservatives and their attack on reasonable environmental legislation and management policies spurred the rise of extremist environmental groups who increasingly viewed American society as corrupt and unwilling to take the steps necessary to preserve nature. The mainstream environmental groups struck back and in so doing achieved success, while their enrollments and donations to their causes increased dramatically. The Sierra Club's membership jumped from 181,000 in 1980 to more than 346,000 in 1983. The Wilderness Society increased from 48,000 in 1979 to approximately 100,000 in 1983 and 333,000 by 1989 and incredibly, approximately 600,000 in 1995. While these environmental groups grew more powerful and led the backlash against the Republican attack on the environment, other environmentalists questioned the tactics and dedication of traditional groups while growing angry at the arrogance of the Reagan administration and in response created even more radical environmental protest groups.

The creation of Earth First! represents the extension of liberal rights to nature to a degree unparalleled in American history. Members of the Foundation for Deep Ecology, a global conservation organization, argue for the very value of nature itself, for its own sake—value that is not to be determined by human recreation, economic, or even health needs. Deep Ecologists maintain that traditional beliefs regarding nature have left it open to economic exploitation. This continues a long tradition extending from the romantics through the transcendentalists through Muir to the present day. The key tenet of the current belief is that humans are part of nature, and therefore what is good for nature is good for humans as well. Many Deep Ecologists also state that government is too beholden to business to restrict its economic activities; therefore, illegal action is actually necessary and morally right in defense of nature. Deep Ecologists believe in the value and sacred nature of wilderness and fill the ranks of groups such as Earth First! and other so-called radical groups.

Earth First! came into existence under the leadership of Dave Foreman, Mike Roselle, and others after conflict and restructuring within the Wilderness Society and discontent with the bureaucracy of central environmental organizations such as the Wilderness Society and the Sierra Club. Earth First! was modeled on the ad hoc eco-saboteurs from Edward Abbey's novel *The Monkey Wrench Gang* (1975). Abbey is probably most famous for his beautifully written *Desert Solitaire* (1968), a book reminiscent of Thoreau's *Walden* (1854). Abbey spent summers as a ranger in the Arches National Monument, which at that time was an underdeveloped and barely visited site in the desert. He wrote fiction and other essays in which he critiqued cattle farmers, the Bureau of Land Management, the National Park Service, and capitalism in general and the development of the West that was destroying a hauntingly beautiful landscape. His critique evolved into a set of ideas about the possibilities of eco-sabotage as a way of slowing ecological destruction—an idea most popularly articulated in *The Monkey Wrench Gang*. Roderick Nash explains the development of this idea in Abbey's work:

> In 1975 Abbey published a rambling novel entitled *The Monkey Wrench Gang*, source of the term "monkeywrenching." Its headquote from Walt Whitman—"Resist Much. Obey Little"—and its dedication to Ned Ludd, whose sabotage temporarily slowed England's industrial revolution in the eighteenth century, set the tone . . . the book described the adventures of a small group of desert-lovers who came out of the mesas and canyons to throw the proverbial monkey wrench into the gears of modern American environmental exploitation. The targets of their raids ranged from bulldozers of roadbuilders to the helicopters of law enforcers and the railways that carried strip-mined coal. The gang even contemplated blowing up Glen Canyon Dam and "liberating" the Colorado River from the stillness of Lake Powell. After considerable debate, Abbey's protagonists resolved not to kill people, but their commitment to the rights of nature brought them to the brink of such extreme action.

The slogan of Earth First!—no compromise in defense of Mother Earth—summarizes the philosophy of the group, a willingness to employ extreme measures in an effort to protect not only natural resources or national parks, but nature itself. Although many members of Earth First! did not engage in eco-sabotage but rather organized rallies and guerrilla theater, many other members have sabotaged earth-moving equipment, spiked trees, and removed surveying stakes. They have also engaged in guerrilla theater in efforts to gain public attention to their causes. One example was the unfurling of a long crack down the face of Glen Canyon Dam in 1981. This action has been undertaken on other dams as well such as the Glines Canyon Dam on the Elwha River in

Washington State. The American media played up the extreme aspects of the group. Members argued that strong measures were required in a society and economy that set few limits on the exploitation of nature for profit. They have had their successes, particularly the ability to slow down the pace of logging on old growth forests. In those cases, they have built platforms in trees and lived in them in an effort to prevent the trees from being cut down.

One positive consequence of the emergence of these groups was to move the parameters of discussion of environmental issues to the left. Thus, old radical groups like the Sierra Club and the Wilderness Society were made to seem more moderate and more attractive to a wider range of Americans, including government and corporations. The extreme groups such as Earth First! moved the debate to the left and thereby created more space in which the formerly radical groups such as the Sierra Club and the Wilderness Society could operate.

The emergence of activists fighting for the rights of animals exemplifies the expansion of political rights to species other than humans. The People for the Ethical Treatment of Animals (PETA) falls between categories. Although their approach is environmental in nature, treating animals ethically will naturally preclude a lot of recreational and economic activity that endangers and destroys habitat and species. It also echoes past efforts such as the abolition movement in its determination to accord rights to a group that has been deemed unworthy of such protection and has suffered as a result.

A more dangerous and effective variation on members of Earth First! is the Earth Liberation Front (ELF), which uses vandalism in opposing development, bioengineering, and other actions deemed dangerous to nature and human health. The movement was propelled into the media limelight with the destruction of ski resort facilities in Vail, Colorado, in 1998. Local opposition and lawsuits had failed to block the planned expansion of the ski resort into a healthy and important habitat of Canadian lynx, a threatened species. Springing into action, the ELF destroyed three buildings and four ski lifts, causing millions of dollars in damage. According to one member of the ELF, the incident "put the concepts of economic sabotage and covert direct action to protect the environment in the minds of billions. Many of those who felt the earth was defenseless against the capitalistic drive to destroy it now felt hope . . ."(ELF Web site) The group received a lot of media attention, but most of the response was negative and critical. In particular, mainstream environmentalists criticized the use of destruction as a way of fighting development. In October of that same year, members of the ELF targeted a mink farm in Michigan where minks were bred for fur production. They have also released wild horses gathered for sale and targeted facilities for pest management research. Although the ELF is definitely a fringe, nonorganized movement that carries on a long tradition of protest in the form of sabotage, it does represent a certain level of frustration with the capitalist political economy to enact and continue meaningful environmental reforms.

The administration of George W. Bush has resembled that of the Reagan era in a number of ways. The administration is comprised of a number of individuals with key ties to the petroleum industry, including Vice President Dick Cheney and National Security Adviser Condoleezza Rice. Bush has broadened an attack on the environment, seeking to open the Arctic National Wildlife Refuge to oil drilling, increasing exploration for oil and coal on fragile desert lands in the West, delaying vehicular emissions standards, allowing increased logging in national forests, and striving to reduce regulatory restrictions on numerous environment-threatening activities. A backlash similar to one that took place during the Reagan administration seems to be growing, as evidenced by the rejection of drilling in Alaska by the Republican-controlled Senate in early 2003.

The Environmental Justice Movement

The environmental justice movement emerged in the early 1980s in response to growing evidence that a disproportionate concentration of pollution was located in low-income communities of color. The belief that minority populations were unequally hurt was demonstrated by scholarly research showing that hazardous materials were dumped in their communities at a much higher rate than in others.

In 1982, the environmental justice movement burst onto the scene with protest and civil disobedience in Warren County, North Carolina. Hundreds of local residents, the majority of them African-American women and children, placed themselves in harm's way, physically blocking trucks from dumping dirt filled with PCBs into a landfill located near their community. The movement gained its name from a speech by the National Association for the Advancement of Colored People executive director Benjamin Chavis in 1987, and in 1990 a coalition of groups emerged. This coalition sent letters to mainstream environmental

groups, criticizing them for a number of issues. According to the letter:

> There is a clear lack of accountability by the Group of Ten environmental organizations towards Third World communities in the Southwest, in the U.S. as a whole and internationally. Your organizations continue to support and promote policies which emphasize the clean-up and preservation of the environment on the backs of working people in general and people of color in particular. In the name of eliminating environmental hazards at any cost, across the country industrial and economic activities which employ us are being shut down, curtailed or prevented while our survival needs and cultures are ignored. We suffer from the results of these actions, but are never full participants in the decision-making which leads to them.

While the mainstream environmental groups came under attack from members of EarthFirst! and Greenpeace for their purported centrist positions, they also came under attack from members of the environmental justice movement for a number of issues. The charges against groups like the Sierra Club and the Wilderness Society are that they were groups of upper- and middle-class whites who preferred to protect streams, mountains, and wildlife rather than deal with another ecological crisis—the crisis of pollution of chemicals and petroleum and dumping of waste in the poor communities of many people of color. The mainstream environmental groups were also criticized for their almost complete dependence on whites for staff and leadership and encouraged to hire more people of color. The movement has expanded in both size and scope in the last decade. Environmental justice groups like Greening Network in San Francisco supports farmers' markets, works on creek restoration, and builds gardening projects in local prisons. Other groups have turned vacant lots into community gardens while planting native trees and plants in order to embrace the idea that nature is not only wilderness but an important part of urban life as well and that an improvement in urban nature can lead to an enhanced urban human lifestyle.

The Nature Conservancy

American environmentalism has taken on a number of faces and followed numerous approaches. The Nature Conservancy has constructed a model of environmentalism that has become remarkably effective and has led to the protection of hundreds of millions of acres of healthy ecosystems in the United States and even more throughout the world. Although this is not a protest movement, it provides an important avenue for attempting to preserve and restore important ecological communities outside the political realm. Through collecting and channeling money, conservation easements, property protection covenants, and cooperative working relationships with ranchers and farmers, the Nature Conservancy has created a middle route outside politics in an effort to preserve nature.

Tearing Down Dams to Restore Rivers

One of the most important environmental efforts has been the project of restoring rivers that have suffered numerous decades of deterioration.

A dam built in 1837 on the Kennebec River in Maine devastated fish runs on that river for over a century. Early protest against the building of that dam by those dependent on shad, alewives, salmon, and other species was ignored in favor of economic development. Over the following 160 years, the river degraded into an industrial sewer as textile mills and lumber mills dumped chemicals and waste into the river and communities along the river dumped untreated sewage into the river. After passage of the Clean Water Act in 1973 requiring industries to clean their effluent and cities to treat sewage, the river began to come back to life, inspiring many fishermen and activists along the river to consider the possibility of the river restored to its former life as an actual ecosystem filled with fish. Organizing into the Kennebec River Coalition, they pursued removal of the Edwards Dam in Augusta, Maine, the state capital, in order to open another seventeen miles of river habitat to spawning fish. The state government joined the activists in pursuing removal of the dam, and finally in 1999, the dam was removed while a large crowd of local residents, reporters, members of local and state government, and activists watched from the shorelines. The result has been the river's remarkable recovery of health. The river runs much cleaner now, the aquatic microorganisms and insects in that stretch of the river have exploded in numbers, and many fish have returned up the river past the old dam site to another dam seventeen miles upstream. The river, from the shoreline in Augusta, looks like a river as water flows by and giant sturgeon can be seen leaping in the water.

This group in Maine is representative of a nation-

wide effort to remove dams and restore fishery populations. A key group in this nationwide effort has been Trout Unlimited, an organization that supports and promotes trout fly-fishing as well as conservation and restoration efforts. This group has targeted numerous small and often useless dams across the country. American Rivers is another important organization that has participated in larger efforts like that to remove the Edwards Dam on the Kennebec River and other smaller projects nationwide. Thanks to these groups and other efforts, thousands of small, irrelevant dams have been removed nationwide, and in the process, river and stream ecosystems have been brought back into better health.

What has emerged is a movement that poses the question as to the value of dams. Are dams sufficiently useful economically to justify the ecological harm they create? In many situations it is proving ecologically and economically beneficial to remove small- to medium-range dams.

Another center of protest against dams has been the effort to have four large dams removed on the Lower Snake River in southeastern Washington State. Beginning in the late 1990s, salmon advocates called for the removal of the dams because of the destruction they wreaked on salmon and steelhead runs from that river and its numerous tributaries. Several species of salmon have gone extinct since the construction of the dams, and many others rest on the edge of extinction. This protest pitted activists against the U.S. Army Corps of Engineers, the builders and managers of the dams, local farmers, Weyerhauser Industries, the owner of a mill in Lewiston, Idaho, that benefits from the existence of the dams, and local conservatives.

Interestingly, this movement centers around endangered species, salmon and steelhead, and uses existing legislative requirements to try and gain removal of the dams. The fact that the dams remain speaks of the strength of farming, industrial, and commercial barging constituencies in blocking the implementation of environmental law. However, a compromise was fashioned in which the dams were to be retained for now but their removal would have to be considered if fish runs on the Snake and Columbia rivers continued their declines.

Restoration is being pursued in other areas as well. Activist groups and many agencies are putting a lot of money and effort into mitigation efforts such as building up streambanks to limit erosion and planting trees to restore forests, control runoff, and recreate habitat for numerous species. The creation of community gardens, prairie grasslands, and small ecological zones represents efforts showing the growth of the environmental idea in American society and the degree to which it has become ingrained in community improvement efforts as well.

The last century has been dedicated to creating a legal structure for protecting nature and human health, as well as constructing environmental philosophies to enable American society to improve its protection and use of nature. The American environmental movement must still use the courts and laws to restrict the abuses of industry and others, while pursuing restoration of ecosystems in the twenty-first century. The future of American environmentalism suggests a movement that will create coalitions between activist groups and property owners, between private business and government, and so on, in order to find ways to preserve what nature remains, as well as bringing dammed rivers back to health, replanting forests, planting grasslands, and restocking the Great Plains with bison. The alternative to a century of restoration is one of continued decline and environmental crises.

Conservation Movement
1880s–1920

The conservation movement, which arose at the end of the 1800s and hit its peak during the early 1900s, helped shift Americans' perception of the environment from something to exploit to something worth preserving for future generations. Conservationists favored preserving unique places like the Grand Canyon, but they also pointed out the economic value and necessity of the government "conserving" natural resources for use by future generations. By doing so, in the words of forester Gifford Pinchot, conservation would provide "for the greatest good to the greatest number for the longest time."

Origins of the Movement

Though concern over the rabid consumption of natural resources and its impact on the land had been expressed as far back as the colonial period, the immediate roots of the conservation movement were more recent. During the forty years before the Civil War, the United States evolved rapidly from a rural, agricultural economy to a commercially based, industrialized one. Wood was the essential component of this expansion, used as the chief construction material and fuel source for a growing, expanding nation. From Maine and New England in the early 1800s, operators had moved westward to the Great Lakes region by the Civil War and then down to the South and out to the Pacific Northwest by the 1880s, leaving behind barren lands subject to injurious soil erosion. Roads, canals, and later railroads continually opened new supplies of timber needed to meet the demand.

Besides lumbering, farming, grazing, and fire also stripped the land of vegetation needed to protect watersheds. Denuding the land upset the delicate balance of nature. The loss of fertile soil made farming more difficult, leading some to abandon their land and move on to new lands, thus perpetuating the destructive cycle. The displaced topsoil inevitably made its way into the waterway systems where the increased amount of silt caused river navigation and water supply problems. Only after comparing conditions between Europe and North America did Americans make the connection between deforestation and watershed protection and turn to science for a solution.

Individuals and Organizations Respond

The decimation of American forests increasingly alarmed a coterie of largely self-taught American scientists and intellectuals. By the time of the Civil War, they had started making predictions of devastating timber shortages. Although some were well versed in botany and knew about individual trees, they had only a minimal understanding of forests as a biological unit. They also knew little of the forests of the Rocky Mountains and farther west. Nonetheless, their concerns led them to investigate matters. The investigations laid the groundwork for later legislative action.

The shift to concern and then to intervention began with the publication of a book in 1864 by George Perkins Marsh, the man widely regarded as the "father" of American conservation. Though a career politician and diplomat from Vermont, Marsh wrote informatively about the impact of human activity on the environment, a phenomenon he had observed throughout his life. Appointed minister to the Kingdom of Italy in 1861, Marsh spent his time researching and examining the environmental conditions and history of southern Europe and the eastern Mediterranean. In 1864, Marsh published *Man and Nature; or, Physical Geography as Modified by Human Action* (revised in 1874 as *The Earth as Modified by Human Action*), the first systematic analysis of humanity's destructive impact on the environment. In this work, he summarized his encyclopedic knowledge of agri-

cultural practices and argued for conservation strategies. The work immediately influenced thinking in America and Europe, and provided the intellectual foundation for the late-nineteenth-century conservation movement and the science of ecology.

Nature, Marsh argued, could not heal itself. Land subdued and then abandoned did not revert to its previous primitive state, but was left impoverished. But Marsh's faith in science led him to conclude that humans could control the environment for good as well as ill, and could, as countries like France were doing, restore the balance of nature. Although Marsh noted how various human activities, such as logging, dam construction, and farming, could adversely affect the land, he also discussed how Europeans were taking measures to stop or reverse the process. European states had recognized the connection between forest cover and soil erosion and began developing forestry as a science in the late 1700s, partially in response to the problem. Forestry also developed in response to the shortage of wood. Instead of discarding slash in a wasteful and ultimately dangerous manner as Americans did, European foresters used every part of the tree, down to scraps the size of pencils. Germans took the lead in developing scientific forestry and utilitarian management to ensure a steady timber supply and a steady profit for the landowner.

Franklin Hough was one of several Americans directly influenced by Marsh's work. Hough, a physician by training who had a strong interest in forest preservation, was a central figure in the establishment of the American Forestry Association, formed in 1875 to promote tree planting and to work for the "protection of the existing forests of the country from unnecessary waste." He was also an early member of the American Association for the Advancement of Science. Both groups provided him forums to voice his fears regarding the destruction of American forests and the environmental damage it was causing.

At the annual AAAS meeting in 1873, Hough presented a paper, "On the Duty of Government in the Preservation of Forests," which drew heavily from Marsh's work. Inspired, the organization asked Hough to write a petition to President Ulysses Grant. In this petition, Hough summarized the problems facing American forests, described the disruption of water flow and its impact, and predicted a dire future if the current practices continued unchecked. The association requested a government-funded forestry investigation into the quantity of lumber, as well as its rate of consumption and waste throughout the country; the influence of forests upon the climate; and, finally, a full statement about European forestry methods and schooling. The petition called upon Congress and state legislatures to pass legislation protecting the forests and acknowledging the economic benefits of preservation. In 1876, Hough was appointed as federal forest agent. Five years later, Congress established the U.S. Division of Forestry within the Department of Agriculture and appointed Hough its first chief.

Hough reported on the widespread destruction of American forests and emphasized that only government ownership of the land and implementation of forestry practices on a national scale could avert catastrophe. In *This Well-Wooded Land: Americans and Their Forests from Colonial Times to the Present* (1985), Thomas Cox credited Hough with pioneering two critical breakthroughs in American forestry: the concept of sustained yield of lumber (defined as high-level annual or regular periodic output) and the system of national forests that emerged at the turn of the century.

Carl Schurz, who had seen the benefits of scientific forestry in his native country of Germany, shared Hough's outrage over the timber destruction in his adopted country of the United States. As secretary of Interior (1877–1881), he tried to institute a national forestry policy when the country had no professional foresters and little interest in forestry management. Schurz called for the establishment of a federal forest reserve system, the initiation of reforestation (large-scale tree planting) practices, fees for the users of national resources, stiff penalties for the willful setting of forest fires, and vigorous prosecution of trespassers stealing timber from government land. His attempts to end political patronage and corruption in the department's General Land Office, which regulated activity on public lands, were thwarted by Congress and the businessmen who benefited from the system.

Charles S. Sargent, another follower of Marsh's and director of Harvard's Arnold Arboretum, produced the multivolume *Report on the Forests of North America* (1884) as part of the Tenth Census. Offering the most comprehensive information on American forests and their destruction up until that time, it supported the recommendations made by Marsh, Hough, and Schurz that land laws as they related to timberlands needed modification to prevent further destruction. He also called for instituting scientific management on the public domain.

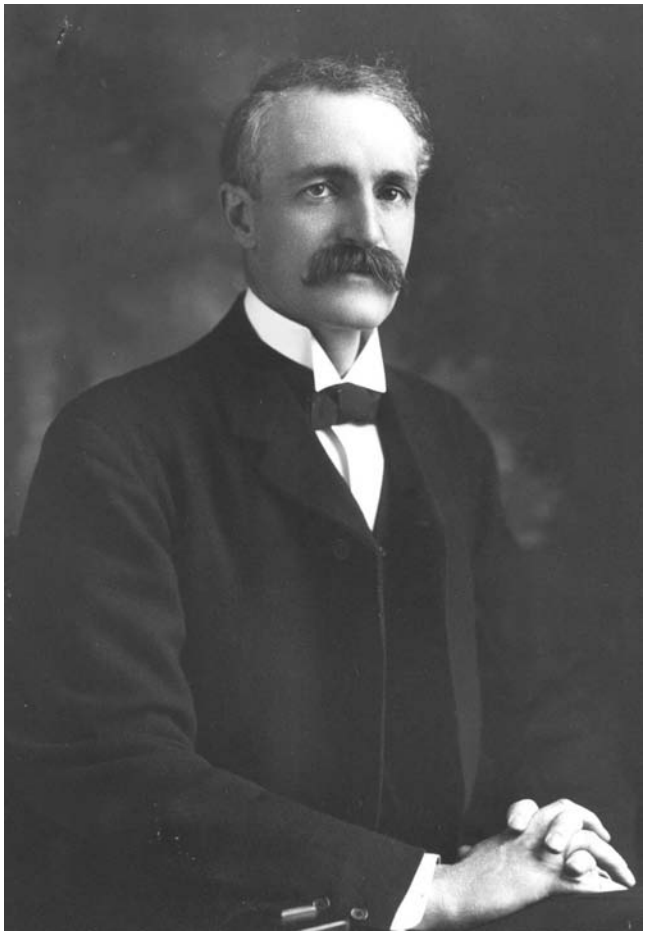
Not all conservationists favored government-controlled development of the public domain. Preservationists drew on the writings of the Transcen-

dentalists and the imagery of the Hudson River school painters for inspiration, but they embraced the science of Marsh and Hough to support their arguments. John Muir, the naturalist who founded the Sierra Club in 1892, and most others viewing the forests from a naturalist perspective, believed that conservation meant preserving the lands in their pristine condition, that there should be no mining, grazing, or lumbering on forest reserves. Forests could provide natural sanctuaries for humans to visit, though some limited development like roads to make the land accessible would be allowed.

This viewpoint, however, ignored the reality of the situation, as Bernhard Fernow, Gifford Pinchot, and other scientists and political economists saw it. America needed huge quantities of wood for its commerce and industry. By 1900, lumbering was the second largest industry in the country, and statistics showed that annual timber consumption was still rising. Western farmers and ranchers competing for water had tangled in shooting wars over water rights. Neither private corporations nor individual Western states could afford to finance the desperately needed irrigation systems to resolve the problem of water shortages. America's options appeared to be narrowing and time was running out.

This group took a utilitarian approach to nature. A forest, they argued, had multiple uses, including providing lumber, water, grazing areas, and minerals, along with recreational uses like hiking and camping. All of these activities, they said, required scientists to employ technology, research, and rational planning to promote the efficient development and use of natural resources, and, at the same time, eliminate waste. Scientists increasingly looked to the federal and state governments, but especially the federal government since it owned so much land, to ensure that the public had affordable access to natural resources for future generations. To maintain economic growth and stave off destructive competition would necessitate the rational development of natural resources.

In 1894, all of these elements collided in the debate over the future of the state-owned land within New York's Adirondack Park. Fear of watershed destruction and soil erosion, along with worry about the loss of idyllic vacation spots in the Adirondack Mountains, led New York State to take action. Utilitarians like Pinchot, Fernow, Schurz, and Sargent wanted to permit selective cutting of timber as a way to regenerate trees for future cutting, to provide income for the state, and to protect watersheds. Preservationists, however, argued for a total ban on development.



Leader of the U.S. Forest Service in the early 1900s, conservationist Gifford Pinchot helped protect public lands, forests, and waterways. He later served as governor of Pennsylvania. *(Forrest History Society)*

Many of them and much of the general public misunderstood the intentions of foresters and feared they wanted to cut all trees in the forests. The state responded with the "Forever Wild" constitutional amendment, which banned any logging on state-owned lands in the Adirondack State Park. The outcome split the budding conservation movement into two factions, conservationists versus preservationists. It also demonstrated to the conservationists that they needed to educate the public about their ideas in order to win their support.

Federal Intervention

Many scientists and progressive reformers alike believed that the federal government should encourage rational, planned management on public lands through regulations that ensured efficient and wise use. The first step was to learn what the country had.

The Bureau of Biological Survey, established in 1885, conducted a series of biological surveys around the country to determine the numbers and habits of birds and mammals. The U.S. Geological Survey investigated possible mineral lands around the country and also made proposals about irrigation projects in the semiarid West. The establishment of the U.S. Division of Forestry in 1881 to conduct scientific research on trees and forests and Sargent's 1884 report filled a substantial gap in forest knowledge.

Appointed division chief in 1886, Bernhard Fernow, a forester born and trained in Germany who emigrated to the United States in 1876, became the first forester employed by the government. Fernow's able leadership placed the agency on a solid scientific foundation. Fernow also served as secretary of the American Forestry Association (AFA). Since the 1880s, the organization had been lobbying Congress for the establishment of forest reservations under public ownership. In 1891, with Fernow's approval and the AFA's support, Congress passed the Forest Reserve Act. The act authorized the president to set aside public land as federal forest reserves for watershed protection and place them under the control of the Department of Interior, but it did not specify what to do with them. Western lumbermen, herdsmen, miners, and water developers resented having the land "locked up" and made unavailable for development. The sponsors of the bill intended forestry to be carried out. All the groups wanted the lands reopened, but each interest group wanted all other activities restricted or prohibited. In the end, they were given restricted and regulated access.

Conservationists continued laboring toward a federal natural resource policy and pushed through the Forest Management Act in 1897. Drafted by Fernow, the Forest Management Act authorized the supervised cutting and sale of timber and basic forestry management, and placed the Interior Department in charge of the work. The Division of Forestry served as technical advisor on forestry to the department for the next eight years. Although the act dictated how the reserves should be used, it only partially but not entirely corrected the Forest Reserve Act. By placing forest reserves under the control of the Interior Department, which included no foresters, rather than in the Agriculture Department, which had foresters, the Forest Management Act left the forests without proper supervision and subject to continued plundering.

Launching the Conservation Crusade

The conservation movement got a much-needed boost when Theodore Roosevelt entered the White House. To many Americans, Roosevelt personified the conservation movement. Though born in New York City, he was a respected naturalist and ornithologist and had been a cattle rancher in the Dakota Territory. His exemplary behavior taught the nation to respect nature and wildlife. While hunting in 1902, for example, he refused to shoot a helpless young bear cub. Editorial cartoonists quickly dubbed the animal "Teddy's bear"—a name soon given to a stuffed toy that became extremely popular and remains so today.

While governor of New York (1899–1900), he invited Gifford Pinchot, recently appointed Fernow's successor as chief of the U.S. Division of Forestry, to Albany to discuss conservation matters. Pinchot, the first American-born professional forester, had made a name for himself by demonstrating the benefits and profitability of scientific forestry management on private lands in North Carolina and New York. Pinchot and Roosevelt found much common ground—patrician backgrounds, a love of the outdoors and the sporting life, a fervent belief that a government using scientific methods could regulate the commercial use of natural resources, and a desire to better the lives of their fellow citizens. The two men became good friends and close allies in the fight to save American natural resources. During his brief tenure as vice president, Roosevelt remained active in the growing conservation movement, often meeting with Pinchot and other experts to discuss issues and plan for the future.

Shortly after becoming president, in September 1901 Roosevelt called Pinchot and Frederick Newell of the U.S. Geological Survey to the White House to help prepare the conservation section of his inaugural State of the Union address and set an agenda for federal management of natural resources. In the address, Roosevelt discussed the need for federal action to save America's forests and rivers with forestry and to bring water to Western farm and rangelands through reclamation. At Pinchot and Newell's urging, Roosevelt requested legislation to transfer the forest reserves to the Agriculture Department and to create a reclamation bureau in the Interior Department, but Congress acted on only the latter request.

In 1902, Congress passed the Reclamation Act. The fees paid by settlers for public land covered the costs of building the dams and irrigation canals needed to bring water to sixteen western states in all. Within the first five years of its existence, the Recla-

mation Service, under Newell's direction, had twenty-one projects under way and initially placed nearly 3 million acres of arid land in a dozen states under irrigation. The federal government supported and ultimately controlled large-scale irrigation projects that transformed the landscape, economy, and social and political structure of much of the semiarid West.

After passage of the Reclamation Act, Roosevelt eased off the volatile political issue of conservation until after the 1904 presidential elections. Elected president in his own right, Roosevelt made conservation one of his central issues and set about educating the general public about its importance. He and Pinchot had learned from the mistakes made during the debate over the Adirondack Park. If the public understood the problem and proposed solutions, they would be more likely to support necessary conservation measures. Pinchot and others flooded the popular press with articles about conservation. Roosevelt himself wrote some along with several forewords for books by naturalists and scientists. Pinchot also designed teaching materials for schoolchildren. Private conservation organizations sponsored informative meetings, helped raise awareness, and bombarded Congress and state legislatures with letters.

The publicity barrage worked. To the general public, conservation became a patriotic cause, described in terms that made it sound like a crusade to save the country. Graduates of newly established forestry and engineering schools flocked to Washington to join the crusade. Pinchot established a professional organization for foresters, the Society of American Foresters, and other professional groups for various sciences quickly came into existence. Like Pinchot and Newell, these men believed that scientific management was the best hope for saving the environment.

Ever the politician, Roosevelt supported preservationists and conservationists alike. Although he was a friend of the naturalist John Muir, founder and president of the Sierra Club, Roosevelt rejected the preservationists' idea of eliminating development in all natural or wild areas as impractical. Instead, Roosevelt promoted Pinchot's program of utilitarian conservation. In 1905, Roosevelt finally convinced Congress to transfer the 63 million acres of federal forest reserves to the Department of Agriculture and to create the U.S. Forest Service to run the "national forests," the new name Pinchot wanted for the forest reserves. (They were officially given this name in 1907.) But like many Americans, Roosevelt also supported the preservation and protection of natural oddities and wonders. He urged Congress to pass the Antiquities (or National Monuments) Act of 1906, which allowed the president to set aside scientifically or historically important areas such as the Grand Canyon for protection. He also established the first federal wildlife refuges to protect wildlife and their habitats.

Pinchot advised Roosevelt to use his presidential authority and appoint commissions to investigate conservation and related matters and gain public support for more legislation. Roosevelt focused national attention on the conservation crusade in 1907 when he appointed the Inland Waterways Commission to design multiple-purpose development of river basins. The next spring, the Governors Conference on Conservation, held at the White House, brought increased publicity for the cause. After the Governors Conference, many individual states copied the federal model by establishing state forests, forest services, and conservation boards. Although the states struggled to catch up to federal activity, Pinchot and Roosevelt continued establishing commissions and expanded the focus of conservation on the federal level to include the health of children, waste in war, and civic beautification. The Country Life Commission, for example, wanted to stop the disintegration of rural life, which reformers considered of vital importance for the survival of America. But by appointing these commissions without specific congressional authorization, Roosevelt ran afoul of the legislative body and alienated its more conservative—and powerful—members.

Growing Opposition

Many westerners and congressmen were displeased that Pinchot, a "lowly" bureau chief, had the president's ear. By 1907, Pinchot's domain had expanded from timber to include coal and mineral lands, oil reserves, and waterpower sites, bringing him into more and more conflicts. Pinchot wanted the Forest Service to spearhead government conservation efforts. Through the enforcement of government regulations and issuance of leasing fees, the Forest Service either directly controlled or had a say in mining, grazing, and lumbering operations within the nearly 132 million acres of national forests, 68 million acres of coal lands, and 2,500 water-power sites.

The appointment of James R. Garfield, a close friend of Pinchot and the president, as secretary of the Interior in 1907, gave Pinchot an important ally in charge of the department with which the Forest Service worked very closely. Together the two decided which tracts of land to withdraw from the public domain for managed development and submitted their

plans to a cooperative president. Large landowners and the corporations that could afford to buy land and purchase leasing rights for mineral or grazing land supported the expanding program, but many small landowners, miners, lumbermen, and ranchers resented the program because they could no longer exploit resources on government land for free. Furthermore, the withdrawal of potential waterpower sites for municipal and agricultural use meant the land could not be used for anything else. It was not surprising that all three men, but most especially Pinchot, all became targets of western hostility.

Speaker of the House Joseph Cannon summed up the developers' side of the argument when he declared, "Not one cent for scenery!" Many western political leaders heard the complaints of their constituents and shared their resentment over the federal government telling them how to handle their land. Some even threatened secession. They accused Pinchot and the president of using "dictatorial" powers to withdraw huge tracts of land without congressional approval. Congress searched for ways to strike back. At the end of 1906, Pinchot's proposal to make the Forest Service financially independent of congressional appropriations gave his enemies on Capitol Hill the opportunity they wanted.

In 1907, Senator Charles W. Fulton (R-OR) succeeded in attaching a rider to a Department of Agriculture appropriations bill reasserting congressional control of all Forest Service revenues. More important, the rider forbade the withdrawal of land in six western states without the consent of Congress. Convinced that it would be unwise to veto such an appropriations bill over the forest reserve issue, the president decided to sign the bill. But while waiting for it to arrive from Congress, he ordered Pinchot and the Department of the Interior to submit their requests for more land withdrawals, an order with which they happily complied. Before signing the agriculture bill, Roosevelt withdrew 17 million additional acres, thereby establishing, or enlarging, thirty-two National Forests. Led by a combination of conservative Republicans and western leaders, Congress retaliated by refusing to fund the work of Roosevelt's many conservation commissions after 1908.

The Taft and Wilson Years

President William Howard Taft, who had served in Roosevelt's cabinet and was his handpicked successor, agreed with Roosevelt on the need for conservation but disagreed on the method. Roosevelt believed that the president, and not Congress, should exercise broad powers, that the amount of the protected public domain should be expanded, and that the federal government should control resource development. In contrast, Taft approached the problem as the lawyer he was. Taft believed that the president should exercise conservative executive power, that Congress should restrict governing to existing federal lands, and that state control was preferred to federal control. He would lease timber, coal, oil, gas and other mineral lands for development by private industry, let Congress determine whether water issues should be under federal or state control, and undertake reclamation projects only on federal public land. He also wanted to consolidate the gains made by Roosevelt and pass laws to affirm Roosevelt's proclamations.

Staunchly protective of the advances made during Roosevelt's administration, Pinchot believed that Taft was not aggressive enough about conservation issues. He became disenchanted with the conservation policies of Taft and Secretary of the Interior Richard A. Ballinger. Ballinger, a reform-minded lawyer from Seattle, had served as commissioner of the General Land Office in the Interior Department from 1907 to 1909. During that time, he repeatedly clashed with Pinchot over land leases issued by the Interior Department. While secretary, Ballinger wanted to turn some Alaskan coal lands in the public domain over to private ownership. Pinchot publicly criticized Taft and Ballinger and interfered in Department of Interior business. After a long public battle, Taft fired Pinchot for insubordination in 1910. The widely publicized congressional investigation into his dismissal returned the spotlight to conservation, much as Pinchot had hoped. Though exonerated by the investigation, Ballinger resigned in disgrace. Pinchot then used his private lobbying group, the National Conservation Association, to continue his crusade after his dismissal.

Pinchot's dismissal brought Theodore Roosevelt out of retirement. Roosevelt, outraged by Taft's handling of the situation, challenged Taft for the Republican nomination in 1912, but was denied and ran on a third-party ticket. The two split the Republican vote, and cleared the way for the election of Democrat Woodrow Wilson, who had little interest in conservation. His secretary of the Interior, Franklin K. Lane, continued the conservation policies of Roosevelt and Taft but without experiencing much of the turmoil of the past. Lane's quiet tenure helped prove the benefits of federal administration of the nation's resources and stifled much of the western opposition to federal control.

Pinchot's successor, Henry Graves (1910–1920), had the difficult task of guiding the Forest Service during the fallout after Pinchot's dismissal. Graves helped save the service from its congressional opponents who wanted to dismantle the agency. In the wake of the catastrophic fire season of 1910, the Forest Service made systematic fire suppression a national policy and the focus of much of its work. Congress responded by passing the Weeks Act (1911), which provided money to promote cooperative fire protection between federal and state governments, and to purchase land to add to the National Forest system for watershed protection. For the first time, the federal government was no longer disposing of land but purchasing it. By 1920, the federal government had purchased more than 2 million acres, almost all of it in the East. The huge demand for wood during World War I led to closer cooperation between the government and private timber companies to cut more timber on public lands, a position that was formalized with the passage of the Clark-McNary Act in 1924. The law promoted a partnership among federal, state, and private interests in promoting fire suppression and other issues, and left private landowners regulating themselves. It has been the mainstay of the Forest Service's policy ever since.

In the 1910s, people increasingly sought to open the forests to recreational use or preserve pristine areas, but wanted an agency other than the Forest Service to oversee areas like the Grand Canyon or Yosemite Park. In light of the Forest Service's mission of developing forests and its support of building a dam in Yosemite Park's Hetch Hetchy Valley to create a reservoir for the city of San Francisco, its critics did not believe that the Forest Service was fit for this duty. Preservationists led by John Muir and the Sierra Club joined with sportsmen, railroads, travel agencies, and highway associations in calling for the creation of a park bureau in the Department of Interior to take charge of national parks. In 1916, over Chief Graves' objections, Congress and President Wilson established the National Park Service within the Interior Department to oversee most of the recreational lands and national monuments once managed by the Forest Service.

Besides land conservation, animal conservation came to the fore as part of the larger conservation movement. Following the publicity surrounding the decimation of the bison and the extinction of the passenger pigeon in the late 1800s, an effort began in earnest first with wildlife preservation and cataloging and then with attempts at propagation. These efforts involved the Forest Service as well as the U.S. Biological Survey, which enforced federal laws and conducted research. By the early 1900s, federal and local governments had fully embraced game management practices aimed at producing sustained populations of wild game for recreational use, such as hunting and fishing. In the 1910s, the American forester Aldo Leopold established game management as a profession, a step that helped formalize and sanction these practices. But as with land conservation, World War I meant suspending or refocusing much of this work for the war effort. Interest in animal conservation remained dormant until the 1930s when Leopold helped found the Wilderness Society (1935) and the Wildlife Society (1937).

Conclusion

Early efforts at utilitarian conservation on local and state levels met with little success, but they provided lessons for those wanting federal intervention. Environmental issues, such as protecting watersheds or preventing soil erosion, required federal solutions. A strong and willing executive branch could formulate the conservation policies, an informed public would support the needed measures, and scientific bureaus populated by nonpartisan scientists and support staff would carry them out. By the time the conservation movement had run its course in the late 1910s, the federal government had firmly established itself as the largest landowner and manager in charge of developing the majority of the nation's natural resources.

Yet problems plagued the conservation movement. The conservation movement never became a truly unified movement. In fact, it split into opposing factions early on. The Ballinger-Pinchot controversy and the fight over Hetch Hetchy Valley left the two sides permanently divided and suspicious of each other. Private organizations supporting preservation and conservation competed with one another for financial support. Government agencies squabbled over their responsibilities and fought for limited budgetary dollars. New projects or commissions began work before the government had a chance to assess the benefits created by earlier ones. Underfunded and understaffed, new federal agencies often had to rely on companies to police themselves. As a consequence, agencies and companies developed close working relationships that limited the effectiveness of regulation. The enormous demands World War I placed on natural resources forced the federal government to set aside conservation and preservation for the sake of the war effort and brought the movement to a halt. The federal government did not enthusias-

tically pursue either of them again until the 1930s. When it did, a second generation of conservation-minded scientists was fully committed to applying technology to resource management.

Antinuclear Movement

The United States' use of atomic weapons against the Japanese during World War II profoundly transformed global military and political tactics, strategies, and philosophies. As atomic weapons became the primary defensive tools of the United States and then the Soviet Union during the Cold War, the two superpowers prepared to unleash a devastating nuclear war, like "scorpions in a bottle, each capable of killing the other, but only at the risk of his own life," in the words of J. Robert Oppenheimer, the head of the Manhattan Project. Throughout the Cold War, antinuclear activists periodically engaged in a movement to counter the political and military mind-set responsible for the environmental, economic, and human threat posed by nuclear weapons and nuclear power. Started by the nuclear physicists who helped create the atomic bomb, the antinuclear movement by the 1980s had changed into a diverse grassroots movement of peace activists, environmentalists, physicians, labor unions, and others. The movement can claim credit for some legislative victories, but its legacy lies more in the widespread cultural diffusion of nuclear fears and themes rather than a significant role in ending the Cold War.

Scientists Begin the Movement
1945–1953

Antinuclear activism began even before the first use of atomic weapons. Many scientists had joined the Manhattan Project because they feared that Germany might build an atomic bomb of its own. When Germany surrendered before the bomb's completion, some scientists felt the bomb should not be used against Japan. Appeals to political elites by prominent scientist Niels Bohr and Hungarian émigré and physicist Leo Szilard, who visualized the chain reaction essential to a nuclear reaction, failed to dissuade the government. On August 6 and 9, 1945, atomic bombs exploded over Hiroshima and Nagasaki.

Some of the Manhattan Project's most renowned physicists grew horrified at what they had wrought. Oppenheimer confessed that "the physicists have known sin." Szilard left the discipline of physics for the more life-affirming field of biology. Hiroshima and Nagasaki inspired many Manhattan Project scientists to seek a role in determining influence in—if not control of—atomic policy in the future. By November 1945, scientists from the Manhattan Project had formed the Federation of Atomic Scientists, later renamed the Federation of American Scientists (FAS). One month later Eugene Rabinowitch at the University of Chicago founded the *Bulletin of the Atomic Scientists*, which became the unofficial voice of the scientists' movement. Other groups included the National Committee on Atomic Information and the Emergency Committee of Atomic Scientists.

The FAS, which consisted of 3,000 members at its peak, threw its strength behind two goals: placing U.S. atomic energy and policy under civilian control, and international oversight of atomic activity. Acting essentially as a government lobby, the FAS rallied against the May-Johnson bill, which would have placed atomic energy under military control. FAS efforts led to the Atomic Energy Act of 1946, which created the Atomic Energy Commission, a civilian agency. To ensure the peaceful application of atomic energy around the world, in 1946 Oppenheimer helped draft a proposal to the United Nations Atomic Energy Commission. The proposal called for the creation of an international agency empowered to inspect countries around the world, assuring that atomic energy was applied only to peaceful purposes. The plan as presented, however, differed markedly from the original. It stipulated that the United States could refuse participation at any time, and it demanded greater disclosure from the Soviet Union than the

United States. The Soviets rejected the plan outright. Cold War politics had dashed scientists' hopes for international control of atomic energy.

The scientists' movement faded soon after 1946. The movement initially touched upon public interests and anxieties about the atomic age. Although they had attempted to bring to politics the cooperation and discourse of the scientific endeavor, political realities hampered their effort. During the late 1940s, the second Red Scare, the Korean War, McCarthyism, and the Soviet detonation of an atomic bomb heightened Cold War tensions. As a Communist menace with nuclear capabilities loomed, Americans saw the antinuclear movement as a hindrance to an adequate defense. Only when a new era in atomic energy arrived did the antinuclear movement revive.

The Movement Revives and Fades 1954–1963

On March 1, 1954, crew members of the Japanese fishing boat the *Lucky Dragon* found themselves covered in radioactive ash—later termed "fallout"—after drifting too close to the Bikini atoll, where the U.S. Atomic Energy Commission had just detonated the first operational hydrogen bomb. When the crewmen returned to Japan suffering from a variety of illnesses, the worldwide fallout scare began. In the following years, as the United States and the Soviet Union detonated more hydrogen bombs, the antinuclear movement grew into a national force.

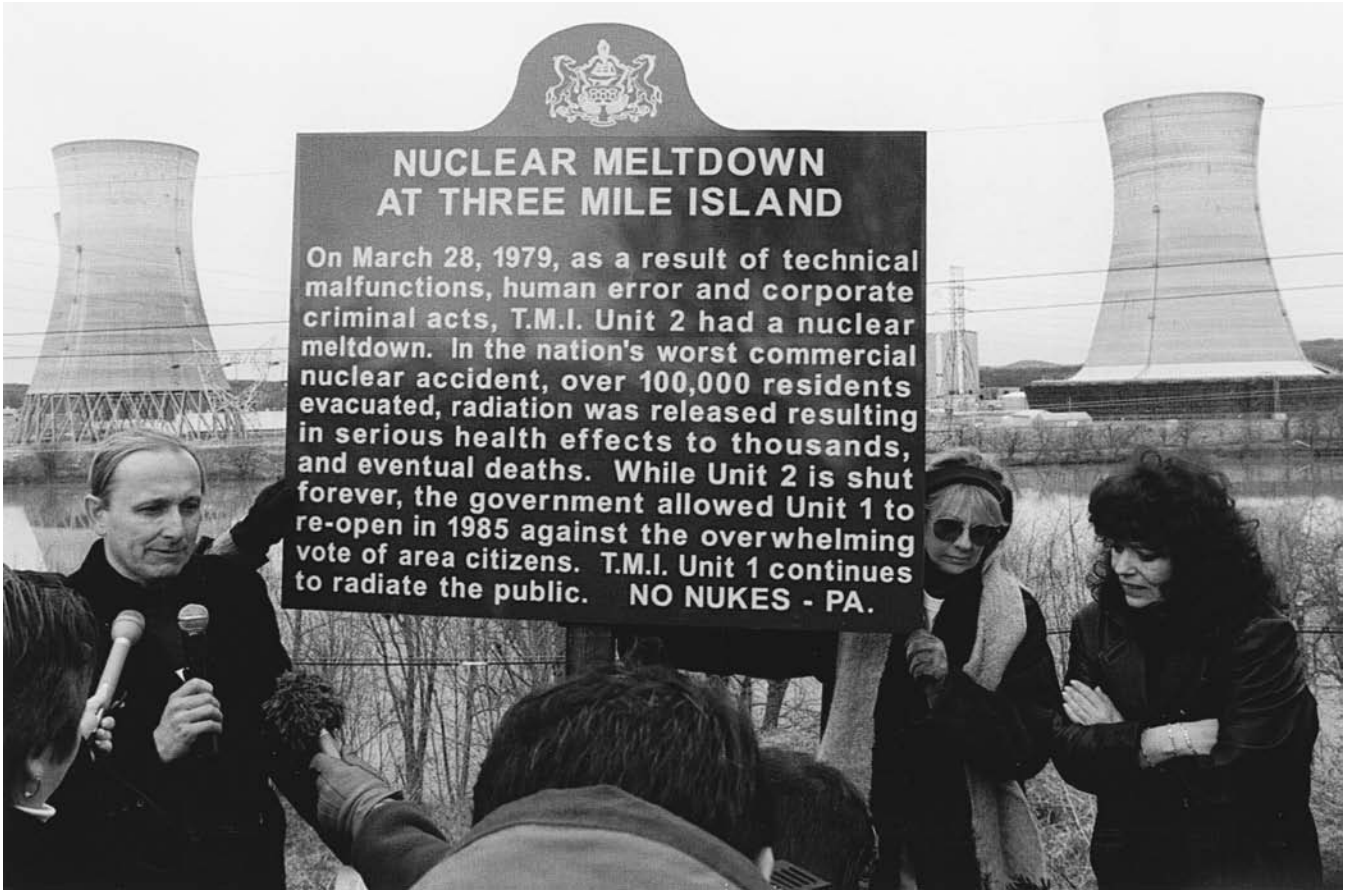
Informed by the British Campaign for Nuclear Disarmament, activists in the United States began to push for a ban on testing. Notable thinkers, including philosophers Bertrand Russell and Albert Schweitzer and scientists Albert Einstein and Linus Pauling, put their voices and prestige behind the movement. During the 1956 presidential campaign, Democrat Adlai Stevenson endorsed a nuclear test ban. In 1957, peace activists formed the first widespread antinuclear organization in the United States: the Committee for a Sane Nuclear Policy (SANE). SANE's primary tactics consisted of dramatic, manipulative, yet informative newspaper advertisements. The most famous pictured physician Benjamin Spock regarding a young child with evident concern. The caption read "Dr. Spock is worried." SANE also organized demonstrations against nuclear testing, the largest of which drew several thousand people to a rally in New York City in 1960.

The scientific community also contributed to this new wave of antinuclear activism. The *Bulletin of the Atomic Scientists* continued to provide a forum for the debate of nuclear policy. Scientists wrote articles describing the dangers of fallout as well as explaining the scientific properties at work. In 1958, scientists led by Barry Commoner formed the Committee for Nuclear Information, aimed at informing the public about the scientific facts of fallout. In Pugwash, Nova Scotia, scientists from around the world, including Szilard, met to discuss an international, scientific approach to solving the dilemma of nuclear war. As testing continued in 1956 and 1957, scientists detected strontium 90, a carcinogenic found only in fallout, in milk, exacerbating the scare. By 1958, almost half of all Americans supported the movement's call for a test ban.

The movement created a stir in the Eisenhower administration. The president's Scientific Advisory Council, formed as a reaction to the Soviet satellite *Sputnik*, worked toward a test ban treaty. These scientists often shared the antinuclear movement's concerns. While the U-2 affair ended any chance of a test ban during the Eisenhower administration, President John F. Kennedy signed the Limited Nuclear Test Ban Treaty in 1963. The treaty banned all nuclear tests in the atmosphere; the superpowers thus commenced testing underground. Although fallout would no longer endanger the citizens of the world, underground testing did not lessen or even slow the development of nuclear weapons; testing actually increased after tests moved underground.

Diversion 1963–1977

While the United States and Soviet Union continued to build nuclear weapons, activism declined steadily through the 1960s and 1970s. The test ban placated many Americans' fears of nuclear weapons. Activists also found their attentions consumed by other issues. Instead of the potential threat of nuclear weapons, an increasing number of American activists focused on the Vietnam War. SANE changed from an antinuclear organization to an anti–Vietnam War group. The radicals of the New Left felt that the antinuclear movement was the cause of an earlier generation. As the war in Vietnam raged, fear of nuclear war faded from the minds of Americans. The United States and the Soviet Union agreed in 1972 not to develop antiballistic missiles under the Strategic Arms Limitation Treaty. This resulted not from activism but from the détente policy of the Richard Nixon and Leonid Brezhnev administrations. As détente progressed, nuclear war seemed to be less of a possibility.



NUCLEAR MELTDOWN
AT THREE MILE ISLAND
On March 28, 1979, as a result of technical malfunctions, human error and corporate criminal acts, T.M.I. Unit 2 had a nuclear meltdown. In the nation's worst commercial nuclear accident, over 100,000 residents evacuated, radiation was released resulting in serious health effects to thousands, and eventual deaths. While Unit 2 is shut forever, the government allowed Unit 1 to re-open in 1985 against the overwhelming vote of area citizens. T.M.I. Unit 1 continues to radiate the public. NO NUKES - PA.

Twenty years after the accident at Three Mile Island in 1979, antinuclear activists hold a sign—designed in the shape of a Pennsylvania historical marker—describing the event. Activists opposed erection of a monument proposed by the Pennsylvania Historical and Museum Commission that contained weaker wording. *(AP Wide World Photos)*

RETURN TO ACTIVISM 1977–1991

At the beginning of the atomic age, the atom exhibited a curious duality. In the form of what became known simply as The Bomb, atomic energy had the power to annihilate. At the same time, people held great hopes for the peaceful uses of atomic energy. By harnessing the power of the atom, scientists hoped to create new advances in consumer and medical technology, as well as a clean and efficient energy source. As they debated the merits of nuclear weapons tests, scientists also touted the merits of the peaceful atom. Nuclear power plants quickly became the most anticipated technology.

By the late 1970s, the Janus-faced nature of the atom could no longer be reconciled. The growing environmental movement confronted the danger of nuclear power. In 1977, a group called the Clamshell Alliance demonstrated at the site of the Seabrook nuclear reactor in New Hampshire; 1,414 demonstrators were arrested. Some activism, such as the efforts of the Union of Concerned Scientists, represented an elite constituency, while activism also flourished on the grassroots level. In the late 1970s in the town of Love Canal, New York, local residents closed down a toxic waste dump that had been poisoning their children. On March 28, 1979, the Three Mile Island nuclear power plant near Harrisburg, Pennsylvania, suffered a malfunction and released a cloud of radioactive gas. Residents on the East Coast feared a meltdown. President Jimmy Carter personally inspected the plant, calming fears of a disaster. The environmental phase of antinuclear activism had nevertheless begun.

As the antinuclear power movement gained momentum, the antinuclear weapons movement returned to prominence. The return can be traced to anxiety caused by the rhetoric and foreign policy of the Ronald Reagan administration. While the arms

race had never disappeared, the Reagan administration spent $2.13 trillion during his eight years in office on the defense budget. In 1985, the Reagan administration's military budget topped the Carter and Ford administration budgets by over $100 billion. The tactic of outspending the Soviets on defense had the effect of alarming great numbers of U.S. citizens. Concurrent with the defense buildup, Reagan embraced a rhetoric that implied the possibility, if not probability, of nuclear war. Referring to the Soviet Union as an "evil empire," Reagan made a sharp break with the conciliatory positions of previous presidents. Top Reagan officials referred to "winnable" nuclear wars, and Reagan himself betrayed a nonchalance regarding nuclear weapons, joking before a press conference that the United States was to begin bombing the Soviet Union within minutes.

Informed by the earlier eras of antinuclear activism, the movement grew into a true grassroots movement reaching all levels of society. In 1979, peace researcher Randall Forsberg proposed a nuclear freeze, where the United States and the Soviet Union would immediately halt production of all nuclear weapons. (A movement of the same name emerged from this proposal.) The astronomer Carl Sagan spoke out during the 1980s about the suicidal and genocidal nature of nuclear war, which would possibly destroy the planet in a scenario called Nuclear Winter. During the height of the movement in the spring of 1982, two major antinuclear demonstrations took place in New York City. At Ground Zero Week, activists demonstrated and spoke about the incomprehensible levels of destruction inherent in nuclear war. In June, between 700,000 and 1 million activists gathered at the New York Rally for Peace in Central Park to demonstrate against nuclear weapons. The crowd represented nearly every segment of society, including labor unions, religious groups, physicians, office workers, lawyers, dancers, and punk rockers. In 1983, the U.S. House of Representatives passed a freeze resolution, but this measure did not pass the Senate. Activists also demonstrated outside of the Lawrence Livermore National Laboratory in California, where scientists researched and tested nuclear weapons.

Soon after this zenith, however, the movement found it had made little progress. Two months after passing the freeze resolution, the House approved over $2 billion to fund the MX missile program; later that year, the United States deployed nuclear cruise missiles in Western Europe. When U.S. voters reelected Reagan in a landslide in 1984, the movement began a quick decline. In 1985, however, the Reagan administration began to soften its Cold War position. With the reform-minded Mikhail Gorbachev in power in the Soviet Union, Reagan agreed to discuss arms reduction. When the Soviet Union collapsed and the Cold War ended in 1991, many activists felt that the need for the antinuclear weapons movement had disappeared.

1991 to the Present

With the Cold War over, the world confronted the dilemma of what to do with the nuclear weapons that remained. Antinuclear activism virtually disappeared during the 1990s, even though nuclear weapons remained a priority of U.S. foreign policy. U.S. officials worried that as the Soviet Union dissolved, its nuclear weapons might end up in the hands of terrorist groups or militant nations. Then in the early 1990s, evidence surfaced that North Korea had undertaken a nuclear weapons research program. While the United States averaged six tests annually as of 1992, antinuclear activism appeared only sporadically. In 1995, Joseph Rotblat, the only scientist to quit the Manhattan Project on the basis of moral objections, earned the Nobel Peace Prize, which was jointly awarded to Rotblat and the Pugwash Conferences on Science and World Affairs for, according to the Nobel Foundation, "their efforts to diminish the part played by nuclear arms in international politics and, in the longer run, to eliminate such arms." In 1996, twenty protesters were arrested at a New York City peace demonstration. Arms reduction continued when U.S. president George W. Bush and Russian president Vladimir V. Putin signed the Treaty Between the United States of America and the Russian Federation on Strategic Offensive Reductions (the "Moscow Treaty") in May 2002, pledging to reduce their nuclear arsenals from about 6,000 missiles each to no more than 2,200 each by 2012. The antinuclear movement, however, had no noticeable role in this phase of disarmament.

The environmental wing of the movement continued its fight well into the 1990s. The Chernobyl disaster of 1986 solidified widespread opposition to nuclear power. During the 1990s, Americans living near nuclear power plants feared a similar disaster. In Connecticut and Michigan, activists protested outdated and dangerous nuclear power plants. In 1995, members of Greenpeace as well as a group of Native Americans squatted at Ward Valley in the Mojave Desert in protest of a toxic waste site. For years activists in New York fought to shut down the Indian Point nuclear reactor power plant in the city of Buchanan. From 1995 to the early 2000s, these activists acknowl-

edged a change in the movement's tactics from direct action, such as protests and demonstrations, to public education and legal challenges.

According to antinuclear activists, the end of the Cold War has not lessened the threat of nuclear weapons and energy. Proliferation of nuclear weapons, materials, and information to rogue states and terrorists, as well as the withdrawal of the United States from nuclear arms treaties, have alarmed activists and ordinary citizens to the continuing possibility of nuclear attack. Authorities suspect that terrorists might target nuclear power plants, sabotaging the reactor and releasing radiation into the surrounding areas. The primary concern is that terrorists will smuggle, steal, or "improvise" a nuclear device, inflicting mass casualties. The Islamic Jihad attempted to acquire fissile materials from Russia, while members of al-Qaeda discussed nuclear weapons with Pakistani scientists in 2001. Although terrorist groups might not have the scientific expertise or resources to build a conventional nuclear bomb, experts speculate that these groups might build a so-called dirty bomb that would release massive amounts of radiation, although such a bomb would be difficult to construct, transport, and detonate. These circumstances caused the editors of the *Bulletin of the Atomic Scientists*, in 2002, to move their atomic clock forward to seven minutes before the midnight of nuclear disaster—the closer the clock is to midnight signifies the nearer the world is to nuclear disaster. This setting is the same at which the clock debuted in 1947.

Environmental Justice Movement

Today's environmental justice movement is predicated upon a belief that the poor and racial minorities have traditionally borne a disproportionate health and socioeconomic cost from industrial production and development. Many scholars have argued that the change from an agricultural to an industrial society led the way to a more civilized and advanced society, with numerous benefits in terms of improvements in health and personal wealth for its members. Unfortunately, this change to an industrial society also led to unforeseen costs in the form of environmental degradation and public health problems directly tied to industrially induced pollution.

Industrial development was accompanied by an increase in environmental illnesses such as asthma, emphysema, lead poisoning, cancer, neurotoxicity, and miscarriages. All of these illnesses are tied to the presence of environmental pollutants generated by the industrial processes. Since the first industrial revolution, environmental inequalities have existed among members of society. This is evidenced by the fact that not everyone in the society benefits equally from the "goods" produced by the industrial processes in the form of an improved quality of life: better housing, better environment, and better health. Similarly, the industrial and postindustrial revolutions in society created whole populations who received a disproportionate level of the "bads" in the form of environmental illness, ecological deterioration, and unsustainable communities. The poor and Irish immigrant communities of Great Britain during the nineteenth century can be seen as an excellent precursive community suffering from environmental injustices, because the cultural, racial, ethnic, and socioeconomic restrictions in their living spaces forced them to live in the midst of industrial production. Their living spaces also lacked proper environmental infrastructures like sewers and privies. These communities suffered devastating health impacts in the form of respiratory illnesses and illnesses tied to inadequate sanitation such as typhoid fever and cholera. This unequal environmental pattern would eventually be reflected across the Atlantic and eventually the globe as industrialization spread during the nineteenth and twentieth centuries.

Today's environmental justice movement has emerged as a reaction to this continuing historical pattern of unevenness in the distribution of environmental costs and benefits in industrialized societies across the world. These environmental inequities have become even more complicated by the factors of race and ethnicity in multiracial and multiethnic societies. The movement in this sense critically examines how a particular form of the benefits and costs (e.g., environmental "goods" and "bads") of industrial and postindustrial society is divided among its members not only based on class but strongly influenced by the racial attributes of certain groups within society. The movement points out that the principle on which the distribution of these benefits and costs (or "goods" and "bads") takes place is largely influenced by the "ability to pay." That is, those who can afford environmental protection will buy it, in the form, for example, of living on land known to be uncontaminated; drinking environmentally safe bottled water; or eating only organically grown and nongenetically engineered foods. This ability to pay or even have access to these environmental goods, however, according to the environmental justice movement is predetermined and heavily influenced by race.

Scholars have not reached a consensus on the exact moment when the environmental justice movement was born. Many believe that the movement began with Dr. Martin Luther King Jr.'s 1968 move toward a Poor People's Campaign and his support of protesting black sanitary workers prior to his assassination. There is also the belief that today's environmental justice movement began with the 1970s'

antitoxic protests of low-income families in Love Canal, New York. Most scholars, however, do agree that the 1982 grassroots protests by African Americans in Warren County, North Carolina, against toxic dumping in their communities was the pivotal and defining moment for today's environmental justice movement. By 1991, the environmental justice movement as we now know it had solidified its basic objectives and strategies for addressing the inequitable distribution of environmental costs in poor and racially marginalized communities. Upon close examination, the historical foundation for the movement is seen to be complex and includes the ideology and methodologies employed in the civil rights movement, the antitoxic movement, the pesticide protests launched by the United Farm Workers (UFW) movement beginning in the 1960s, and unprecedented intellectual support from academic professionals. UFW's historical struggle for farmworkers to gain control of their working conditions in the 1960s was the first environmental movement led by people of color. This precursive environmental justice movement was led by Cesar Chavez and demanded the ban of certain pesticides in the workplace, including DDT.

Martin Luther King Jr. and the Poor People's Campaign

Activists in the environmental justice movement constantly emphasize the inextricable relationship between poverty and environmental racism. They argue that the environmental disenfranchisement of the poor is symptomatic of their overall systemic social, cultural, political, and economic disenfranchisement. The first national leader to address the systemic disenfranchisement of the poor in this country and the concomitant environmental consequences of this dilemma was the civil rights activist the Reverend Dr. Martin Luther King Jr. In 1968, Dr. King began to openly advocate plans for a multiracial march for the poor on Washington, under the Poor People's Campaign. A critical issue in the proposed Poor People's Campaign was the need to address the problem of the poor living in unhealthy and unsanitary housing conditions. King argued at that time that the United States could not have a democratic society if it was going to have greatly concentrated wealth in the hands of only a few members of its society. As the plans for the Poor People's Campaign began to emerge, King's commitment to environmental issues impacting the poor and racially marginalized were made more apparent in 1968 when he traveled to Memphis, Tennessee. He came to Tennessee to lend his support to a largely black group of striking sanitation workers and was then assassinated. Dr. King's openly expressed concern over the inequitable distribution of wealth and poverty in the United States and the concomitant environmental consequences are echoed in today's cries by environmental justice activists. By the 1960s, isolated researchers discovered that environmental hazards had a disproportionate impact on people of color and low-income people. Activists in the environmental justice movement continually lament the fact that it is the poor of society who bear the cost of environmental pollution because they don't have the economic power to eliminate or avoid the costs of industrial production in their impoverished communities.

Nascent Environmental Justice Ideologies, Philosophies, and Movements 1970s

Although a national movement to address the environmental inequities in poor and minority communities had not emerged in the 1970s, the philosophical and ideological underpinnings for the movement were in place. Contrary to much of the published literature on the first Earth Day, April 22, 1970, African Americans and other communities of color had already begun an open dialogue about environmental justice issues. National and local articles appeared in newspapers and magazines during this time describing the reactions by African-American communities and their leaders to the new environmental movement. Many of these articles elucidated African-American concerns about environmental issues plaguing their communities. Their concerns were mirrored in nature and form by those expressed by Dr. King in 1968 and revolved around needs for sanitary housing, environmental infrastructures, and the illegal dumping of waste and garbage in their communities. For instance, one day before Earth Day, the prominent black Chicago newspaper, the *Chicago Defender,* ran a photographic report about the visit of special presidential assistant Robert J. Brown and his Task Force on Aid to Disadvantaged Communities to the impoverished community of Robbins, Illinois. The report pointed out that this poor African-American community was suffering from environmental health problems because of inadequate sanitary infrastructure and that the environmental problems were so severe that Robbins's residents were contracting hepatitis because of high levels of sewage in the standing water.

The connection between poverty and environ-

mental disenfranchisement was also reflected in the comments made during this time by another prominent civil rights activist, the Reverend Jesse Jackson. During the first Earth Week in April 1970, Reverend Jackson, who founded Chicago's Operation PUSH in 1971, went to Congress to discuss the country's continuing need to resolve the problems of the poor. Jackson urged the government to focus its concern on the issues of hunger and sanitary housing and decried the attention that was being given to the traditional environmental movement. Jackson felt that the new movement was drawing attention away from the civil rights movement. Jackson's sentiments were echoed across the country by many politicians, especially by the country's first African-American mayors, Carl B. Stokes of Cleveland and Richard Hatcher of Gary, Indiana. Blacks, Mayors Stokes and Hatcher stated in an Earth Day *Businessweek,* were more likely than whites to suffer from environmental illnesses, and their environmental problems were symptomatic of deeper societal ills such as poverty, racism, and inequitable political power. The April 1970 issue of *Ebony* contained an article focusing on environmental problems in African-American communities. African-American periodical sources clearly show that while African Americans recognized the environmental movement, they had their own views on which "environmental issues" were critical for their communities. Their concerns centered on what they perceived to be a shift to an issue (the environment "without man") that was eclipsing their basic needs for ensured survival in an indifferent or hostile "human" environment. An environmental justice consciousness had already emerged in the 1970s, and on Earth Day 1970 African-American Chicagoans actually had their own separate communitywide environmental celebrations.

At the national level during this period, African-American politicians and periodicals emphasized that for African Americans the important environmental issues were those that touched on basic social justice issues such as hunger, adequate housing, and safe water sources. By the end of 1970, a multiracial coalition of urban environmentalists would begin to focus on public health and working conditions and sought to reform the environmental movement to include issues of both race and class. By the late 1970s, Dr. Robert Bullard, now a prominent environmental sociologist and key figure in the environmental justice movement, had studied land use in Houston, Texas, and found that garbage dumps had a disproportionate impact on people of color and low-income people.

The year 1976 brought one of the first environmental justice court cases to trial, *Bean v. Southwestern Waste Management Corporation.* This case stemmed from the protest of minority residents of Houston, Texas, who had opposed locating a hazardous waste site within 1,500 feet of a public school that had no air conditioning. The residents contended that they had already had more than their fair share of hazardous waste sites and should not be burdened by additional waste. The final decision on the case was rendered in 1979 in federal court: the judge acknowledged that, although the decision to locate the hazardous site was "unfortunate and insensitive," the neighborhood had not proven the necessary racial animus (racist intent) to prove their case.

The Urban Environment Conference

In 1976, six years after the first Earth Day, the Urban Environment Conference (UEC) was developed through a unique coalition of organizations (labor, environmental, and minority) dedicated to incorporating race and class issues into the environmental movement. This coalition would initiate "City Care" conferences that would be held in cities across the United States and would foster the development of the foundations for the environmental justice movement as we know it today. UEC's activities, contrary to prevailing environmental justice myths, actually were supported by a traditional environmental movement organization; it received its first financial contributions from the Sierra Club and labor unions.

When UEC arrived in Michigan in 1976, it brought together representatives from labor unions, environmental groups, economic justice organizations, and churches to discuss issues of economic justice and the urban environment. As a result of the Michigan conference, a $66,000 federal grant was made to UEC, which the organization used to fund eleven similar "City Care" conferences throughout the United States. Sponsoring agencies that helped fund conferences were the Environmental Protection Agency (EPA) and the Departments of Housing and Urban Development (HUD); the Interior; Energy, Agriculture; and Transportation. The UEC conferences and activities emanating from them led to the adoption of the first Right to Know legislation in Delaware. These Right to Know laws would become central to locally based environmental activism because future plants would be required to provide notice of potential environmental risks to the community. The knowledge of environmental risks gained by affected

Long Island's Brookhaven National Laboratory in Upton, New York, was the site of radiation leaks, toxic waste, and environmental mishaps. A sign warns people not to enter. *(AP Wide World Photos)*

communities empowered urban environmental activists and laid the groundwork for research and documentation of environmental injustices in the 1980s and 1990s.

In 1979, the National Urban League, the Sierra Club, and the UEC held a national conference in Detroit, Michigan, that would come to have a major influence on the present-day environmental justice movement. A total of 750 people, mostly community activists familiar with the grassroots impacts of national problems, convened for three and a half days, and at least seventy-five national and community-based cosponsoring organizations also attended the conference. Addresses by community leaders, information sharing, and the setting of new coalition agendas concerning the urban environment were the main thrust of the Michigan conference. The issues addressed during this particular conference included public health, neighborhood empowerment, urban parks, suburban sprawl, and public transportation.

1978: Love Canal

Many scholars believe that the environmental justice movement in the United States began on August 2, 1978. This was the day when CBS and ABC networks first carried news of the effects of toxic waste on the residents of Love Canal, a predominantly white working-class community in Buffalo, New York. The New York State health commissioner had just announced that the landfill created by the Hooker Chemical Company had created a serious and extremely dangerous public health threat to the residents of Love Canal. In 1952, Hooker had dumped thousands of drums of toxic waste into an abandoned navigation canal and filled in the area. The company then sold the land to the Niagara Falls Board of Education, and eventually a school and houses were erected on this landfill. Soon after people moved into the area, alarming health problems and birth defects began to be reported. As a result of Hooker's dump-

ing practices, pesticide residues and other chemicals resurfaced and were seen bubbling up onto the surface. Adults, children, and animals were burned and people reported seeing explosions. The residents' children and pets also received chemical burns from playing with dirt in the schoolyard and their backyards. Many of the residents' lawns wouldn't grow, and more important, where plants would grow, people would get sick after eating the produce grown in their gardens.

Grassroots environmental activism was critical to the successful resolution of the environmental dilemmas at Love Canal beginning in 1978. This activism was led by Lois Gibbs, whose own three-year-old child, Michael, developed a respiratory illness tied to the toxic waste present in Love Canal. Moved by her own child's illness and the illnesses of many children in the community, Gibbs developed the Love Canal Homeowners' Association and took their complaints to the state's capital (Albany) for resolution. Their activism led to an investigation by state epidemiologists in 1978 that found unusually high rates of birth defects, miscarriage, epilepsy, liver abnormality, rectal bleeding, and headaches at Love Canal. Gibbs's continued activism finally persuaded the government to investigate. By 1980, the federal government had identified 248 chemicals in the dump site, and ultimately more than 400 were found. Upon the revelations produced by both state and federal investigations, residents were evacuated from Love Canal. The state of New York purchased more than 230 of the residents' homes and financed some of the relocation costs; many of the homes were demolished. By the late 1970s, President Jimmy Carter had declared Love Canal, New York, a disaster area, which entitled the Love Canal residents to federal aid that could be used for their relocation to other communities. Gibbs's successful environmental activism became a model for other female environmental justice leaders across the country.

The Birth of the Environmental Racism/Justice Movement 1980s

By the turn of the twenty-first century, environmental justice had become synonymous with the concept of environmental racism—that is, the disparate and unequal distribution of environmental costs due to racism. The environmental justice movement (as well as the change in the primarily race versus class-based premise) was born in Warren County, North Carolina, in 1982 when African Americans mounted one of the first national protests against the siting of a hazardous waste site, "Hunt's Dump." The dump was named for North Carolina's governor at the time, James Hunt.

Governor Hunt had selected 142 acres of land in Afton, a small black community in Warren County, as the disposal site for the 32,000 cubic yards of dirt contaminated with toxic polychlorinated biphenyls (PCBs). The decision came following a survey of ninety-three sites in thirteen counties. The soil had been taken from 217 miles of North Carolina state highway where it had been illegally dumped by the Robert Burns and Ward Transfer Company in 1978 in fourteen North Carolina counties. The Burns and Ward Company had transported the waste from Buffalo, New York, and decided to dump it illegally along the highway rather than properly store it according to federal, state, and local regulations.

Afton was a stable community with a high home ownership rate; 84 percent of the residents in the area surrounding the protest site were African Americans, and 64 percent of these owned their own homes. Unfortunately, the community had a high water table in porous sandy soil, and most of its residents got their water from wells. This clearly was not the optimal site for the land disposal of PCBs. Its water table was only 5 to 10 feet beneath the surface, and so, in short order, its well water would be contaminated. Residents rose up swiftly in protest.

Governor Hunt claimed that he selected Warren County as the disposal site based solely on technical premises. However, the chief of the EPA's hazardous waste implementation branch, William Sanjour, a supporter of Warren County residents, later disputed this claim. Sanjour observed that the siting decision was politically motivated and that only political pressure would impact the decision. Protests to pressure decision makers against locating the toxic dump in Warren County were then organized under the leadership of Afton (and Warren County) resident Ken Ferruccio and his wife, Deborah. They would eventually organize the grassroots activist group Warren County Citizens Concerned about PCBs. Their protest actions were eventually joined by nationally prominent civil rights advocacy groups such as the United Church of Christ (UCC) Commission for Racial Justice, the Southern Christian Leadership Conference, religious leaders, as well as environmental activists and political officials. Lois Gibbs, the Love Canal activist, came to Warren County in February 1982 to support Ferruccio and other residents.

Warren County residents peacefully protested the siting of the landfill site for over six weeks in 1982

United Church of Christ leader Benjamin Chavis coined the phrase "environmental racism" to describe the greater prevalence of polluted facilities in communities with large numbers of poor blacks and other disadvantaged groups. He is shown here with his hand on Nation of Islam leader Louis Farrakhan after he joined the Nation of Islam in 1997. *(AP Wide World Photos)*

and attempted to physically block the path of over 6,000 truckloads of PCB-contaminated soil. These peaceful protests resulted in the arrest of more than 500 people, including two civil rights activists who would prove instrumental in the national recognition of the movement: the District of Columbia delegate Walter E. Fauntroy and the Reverend Benjamin Chavis, then executive director of the UCC Commission for Racial Justice. The arrests of protesters, including Dr. Joseph Lowery of the Southern Christian Leadership Conference, marked the first time in American history that citizens had been sent to jail for trying to stop a toxic waste landfill located in a community of color.

Although the Warren County Citizens group was not in the end successful in preventing the siting of the landfill, they were eminently successful in making environmental racism a national concern. The actions of Warren County protesters had a long-term impact on influencing future national environmental policies dealing with environmental inequities in communities of color. Governor James Hunt eventually acceded to the Warren County residents' demands that the state not build any additional landfills in their community and that their well and body water would be regularly monitored for PCB contamination.

In 1983 and within one year of the Warren County protest, District of Columbia delegate Walter Fauntroy persuaded the Government Accounting Office (GAO) to study the 1983 siting of hazardous waste landfills

in EPA Region IV, which included Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, and Tennessee. The resulting GAO report, *Siting of Hazardous Waste Landfills and Their Correlation with Racial and Economic Status of Surrounding Communities*, found that three out of every four landfills were located near predominantly minority communities. The report eventually spurred the 1987 national study by the United Church of Christ led by the Reverend Benjamin Chavis, who would later become the executive director of the National Association for the Advancement of Colored People (NAACP).

Four years later, the 1987 UCC Commission for Racial Justice, in response to the Warren County dilemma, sponsored the study, *Toxic Wastes and Race in the United States: A National Report on the Racial and Socioeconomic Characteristics of Communities with Hazardous Waste Sites.* The study concluded that race was the best predictor of hazardous waste site location. UCC's Commission for Racial Justice employed Public Data Access, a New York–based research firm, to assist in the analysis of this information. Their statisticians found only a 1 in 10,000 chance that such siting patterns could occur randomly. Environmentalists studying incinerators found the same results. The phrase "environmental racism" would be coined by the Reverend Chavis of the UCC as a reflection of the fact that toxic facilities were more likely to be found in communities dominated by racial minorities, the poor, the elderly, and the young.

More than a decade would elapse before a national policy response was developed to deal with environmental racism. The changes in environmental regulation and enforcement policies effected by the Reagan administration undermined the fragile coalition that had formed among minority communities, labor, and environmental groups. These groups focused on their own constituencies and began to fight over whatever federal funding and programmatic support that had remained during the Reagan (1981–1989) and George H.W. Bush administrations (1989–1993).

First Steps of the Environmental Justice Movement 1990s

In 1990, a group of academics met at the University of Michigan's School of Natural Resources and Environment (the group came to be known as the Michigan Group) to discuss their most recent findings on the relationship between race and environmental hazards. This conference led to the formation of the Michigan Environmental Justice Coalition. Prompted by their own findings, the group wrote letters to Louis Sullivan, secretary of the United States Department of Health and Human Services, and to William Reilly, head of the United States Environmental Protection Agency (EPA). A meeting with Reilly and seven of the professors resulted in the creation of the Work Group on Environmental Equity. Its primary objective was to examine the agency's negligence or insensitivity to issues of environmental racism.

The year 1990 also saw the release of another landmark environmental justice study: the Greenpeace Incinerator Report, *Playing with Fire*. The published report concluded that the percentage of minorities in communities with existing incinerators was 89 percent higher than the national median and that communities with proposed incinerators had 60 percent more minorities than the national median.

Disgusted by the policies and practices of traditional environmental groups, environmental justice activists would issue a public challenge to these groups in 1990. Richard Moore, executive director of the Southwest Organizing Project, and Pat Bryant, executive director of the Gulf Coast Tenants Organization, drafted a letter that would eventually be signed by more than 100 community leaders and sent to the ten largest traditional environmental groups. The letter accused the traditional environmental groups of racism in their hiring and policy development processes. The political stir caused by this event influenced Chavis (a signatory of the letter), who at the time was head of UCC's Commission for Racial Justice, to call for an emergency summit of environmental, civil rights, and community groups. The UCC spearheaded the planning of the summit under the direction of Charles Lee, the UCC director for the environmental justice program under UCC's Racial Justice Commission. The summit would take eighteen months to plan and involved Lee, Pat Bryant, Moore, Dana Alston of the Panos Institute, the Indian activist Donna Chavis of North Carolina, and the academic Robert Bullard. Their plans led to the historic First National People of Color Environmental Leadership Summit in Washington, D.C., in October 1991. The summit would conclude with a demand that the EPA address their environmental justice concerns. Two of the summit organizers, Ben Chavis and Robert Bullard, would be appointed to President-elect Bill Clinton's transition team to help formulate national policies addressing environmental inequalities.

The summit brought together more than 300 delegates and 400 observers and supporters to Washing-

ton, D.C., on October 21–24, 1991. The two groups formed at the meeting were the Indigenous Environmental Network, which was challenged to promote the interests of Native American activists, and the Southern Organizing Committee, which organized the Southern Community Labor Conference for Environmental Justice in New Orleans in 1992, a gathering of nearly 2,000 activists from fourteen states. The 1991 summit also featured nearly 1,000 environmental justice activists from across the country, Africa, and South America who met to develop principles and a call for national and worldwide action. Three basic philosophies emerged from the meeting: (1) environmental justice was not separate from economic and political struggles in communities of color; (2) environmental justice was intrinsically related to community empowerment; and (3) establishing a just environmental justice policy should be an exclusionary dialogue recognizing that communities of color speak for themselves.

More than 650 grassroots leaders adopted the "Principles of Environmental Justice," a platform calling for an end to the discriminatory poisoning of low-income communities and people of color worldwide. These principles would eventually be incorporated into President Clinton's 1994 Executive Order on environmental justice.

In 1991, the EPA issued the groundbreaking report, *Environmental Equity: Reducing Risk for All Communities*. The report underscored the historical and present-day environmental inequities and focused on the need for governmental intervention where the pollution is greatest—communities of color.

The year 1991 also witnessed a decision in one of the first federal environmental justice cases, *RISE v. Kay*. Residents Involved in Saving the Environment (RISE), a biracial group, brought suit in protest of siting a fourth regional landfill in King County, Virginia, which was 42 percent African American and 57 percent white. The case revealed that three other landfills were already located in the county and that all of them were in African-American neighborhoods. Even though the judge did find a disproportionate impact by race, he ruled that because no intent to discriminate was shown, it was therefore legal to develop the new landfill. This "smoking gun" approach would plague environmental justice activists in future courts through the new millennium.

By 1992, the EPA Work Group on Environmental Equity produced a two-volume report titled *Environmental Equity: Reducing Risk in All Communities.* The four major findings of the report were as follows:

1. Clear differences existed between racial groups in terms of disease and death rates; and there was a general lack of data on environmental health effects by race and income with the exception of lead. In addition, a significantly higher percentage of African-American children than white children had unacceptably high levels of lead in their blood.
2. People of color and low-income populations experienced higher than average exposures to selected air pollutants, hazardous waste facilities, contaminated fish, and farm pesticides in the workplace.
3. Data were not routinely collected on health risks posed by multiple industrial facilities and the synergistic effects or multiple pathways of exposures.
4. Native Americans had unique problems as an ethnic group, with a special relationship to the federal government. Their problems were exacerbated by their lack of general infrastructure, institutions, trained personnel, and resources necessary to protect their members.

The work group would also recommend the creation of an Office of Environmental Equity (later changed to the Office of Environmental Justice), which was implemented in November 1992. The office's primary responsibility was to serve as the point of contact for environmental justice outreach and educational activities, technical and financial assistance, and information dissemination. An Environmental Equity Cluster (a separate senior executive committee) was formed at the same time to develop the agency's national policies, guidance, and agenda for environmental justice.

An official declaration of the U.S. government's recognition and commitment to addressing the problem of environmental inequalities was finally announced in 1994. On February 11, 1994, President Clinton signed Executive Order 12898 on environmental justice. The official title of the order was "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations." The order focused on the "environmental and human health conditions" in people of color and low-income populations with the goal of achieving equal environmental protection for all communities regardless of their race, income status, ethnicity, or culture. It directed all federal agencies with an environmental and public health mission to make environmental justice an integral part of their mission. The order also made

Environmental Justice Principles

Adopted, Washington, D.C., October 1991
First National People of Color Environmental Leadership Summit

Preamble

We, the People of Color, gathered together at this multinational People of Color Environmental Leadership Summit, to begin to build a national and international movement of all peoples of color to fight the destruction and taking of our lands and communities, do hereby reestablish our spiritual interdependence to the sacredness of our Mother Earth; to respect and celebrate each of our cultures, languages, and beliefs about the natural world and our roles in healing ourselves; to insure environmental justice; to promote economic alternatives which would contribute to the development of environmentally safe livelihoods; and to secure our political, economic, and cultural liberation that has been denied over 500 years of colonization and oppression, resulting in the poisoning of our communities and land and the genocide of our peoples do affirm and adopt these Principles of Environmental Justice:

1. Environmental Justice affirms the sacredness of Mother Earth, ecological unity and the interdependence of all species, and the right to be free from ecological destruction.
2. Environmental Justice demands that public policy be based on mutual respect and justice for all people, free from any form of discrimination and bias.
3. Environmental Justice mandates the right to ethical, balanced and responsible uses of land and renewable resources in the interest of a sustainable planet for humans and other living things.
4. Environmental Justice calls for universal protection from nuclear testing, extraction, production and disposal of toxic/hazardous wastes and poisons and nuclear testing that threaten the fundamental right to clean air, land, water, and food.
5. Environmental Justice affirms the fundamental right to political, economic, cultural and environmental self-determination of all peoples.
6. Environmental Justice demands the cessation of production of all toxins, hazardous wastes and radioactive materials and that all past and current producers be held strictly accountable to the people for detoxification and the containment at the point of production.
7. Environmental Justice demands the right to participate as equal partners at every level of decision-making including needs assessment, planning, implementation, enforcement, and evaluation.
8. Environmental Justice affirms the right of all workers to a safe and healthy work environment, without being forced to choose between an unsafe livelihood and unemployment. It also affirms the right of those who work at home to be free from environmental hazards.
9. Environmental Justice protects the right of victims of environmental injustices to receive full compensation and reparations for damages as well as quality health care.
10. Environmental Justice considers government acts of environmental injustice a violation of international law, the Universal Declaration on Human Rights, and the UN Convention on Genocide.
11. Environmental Justice must recognize a special legal and natural relationship of Native Peoples to the U.S. government through treaties, agreements, compacts, and covenants affirming sovereignty and self-determination.
12. Environmental Justice affirms the need for urban and rural ecological policies to clean up and rebuild our cities and rural areas in balance with nature, honoring the cultural integrity of all our communities, and providing fair access for all to the full range of resources.
13. Environmental Justice calls for the strict enforcement of principles of informed consent, and a halt to the testing of experimental reproductive and medical procedures and vaccinations on people of color.
14. Environmental Justice opposes the destructive operations of multi-national corporations.
15. Environmental Justice opposes military occupation, repression and exploitation of lands, peoples and cultures, and other life forms.
16. Environmental Justice calls for the education of present and future generations which emphasizes social and environmental issues, based on our experience and an appreciation of our diverse cultural perspectives.
17. Environmental Justice requires that we, as individuals, make personal and consumer choices to consume as little of Mother Earth's resources and produce as little waste as possible; and make the conscious decisions to challenge and reprioritize our lifestyles to insure the health of the natural world for present and future generations.

federal agencies responsible for ensuring that states and organizations receiving federal monies for environmental projects did not violate federal civil rights laws. Finally, the order established the Interagency Working Group on Environmental Justice with membership from the heads of agencies and departments like Justice, Defense, Energy, Labor, Interior, Transportation, Agriculture, Housing and Urban Development, Commerce, Health and Human Services, and the EPA.

Conclusion

Has the environmental justice movement been a success? The answer to this question is quite complex given the legal, environmental, and health histories of communities suffering from environmental inequalities since their recognition in Warren County, North Carolina, in 1982. The movement is a hybrid of a classical social movement and a new social movement. Many of the victims of environmental inequalities lacked political power and sought out a vehicle through the movement to gain this power. In this sense, the environmental justice movement has been successful as a traditional social movement. Residents of Love Canal were evacuated from a deadly housing site because their voices were heard. In contrast, many environmentally disenfranchised groups like the People for Community Recovery (PCR) in Altgeld Gardens, Chicago, Illinois, or the Chester Residents Concerned for Quality Living (CRCQL) in Chester, Pennsylvania, would participate in the movement but with very little success. PCR filed a lawsuit against its landlord, the Chicago Housing Authority, stemming from the illegal dumping of PCBs in 1999. Residents are still awaiting a decision on this case, in spite of the persistent environmental health problems in the community, especially in the children.

In the early 1990s, CRCQL residents mounted an effective political mobilization to protest siting a medical waste sterilization facility (Thermal Pure) next to a Westinghouse incinerator. CRCQL residents, however, like Warren County, North Carolina's residents, ultimately lost the fight to prevent the site from coming into their neighborhood.

In all three cases, as well as in many other environmental justice cases across the country, the environmental justice movement serves as an excellent example of a New Social Movement (NSM) that is postindustrial and aligned with the expansion of rights and quality of life issues. NSMs are also characterized as local efforts limited to a geographical area. Most of the grassroots activism of environmental justice activists is targeted to changing the quality of life for a specific geographical location. Even with this narrow focus, however, many of their efforts are failing as a result of legal decisions. The Achilles' heel for most of these efforts is the need to show racial intent by planners and policymakers. Few environmental justice groups have been able to achieve this objective. Although activists in this movement are acutely aware that racism is manifest in every corner of society, they have been unable to legally document that this racism is intentional.

Academics have had a strong influence on the movement, sparking and invigorating local struggles. In Los Angeles, for example, a community struggle led by Concerned Citizens of South Central Los Angeles against a giant garbage incinerator received crucial support before a key vote of the city council when the University of California at Los Angeles (UCLA) School of Urban Planning released a 700-page critique of the incinerator project and its disproportionate impact on people of color in Los Angeles. Their work also shaped or reaffirmed movement leaders' consciousness about the structural or systemic nature of environmental oppression.

Academics have also provided critically needed expertise to community groups during litigation or administrative advocacy in local environmental justice struggles. The best-known example is Bullard's documentation of racially biased decision-making criteria in siting a nuclear waste processing facility in rural Louisiana. This documentation was directly responsible for the federal government's decision to deny a permit to the facility.

Animal Rights Movement

The animal rights movement began to capture broad public attention after 1980, as a vital, grassroots-based challenge to the exploitation of animals for food, hunting, entertainment, fur and fiber, medical research, and product testing, to name the most contested areas of usage. Reviving and incorporating some of the premises of a century-old anticruelty movement, animal rights advocates have pursued an ambitious agenda to reshape human attitudes and conduct toward animals, at a time when human control over other species has never been greater.

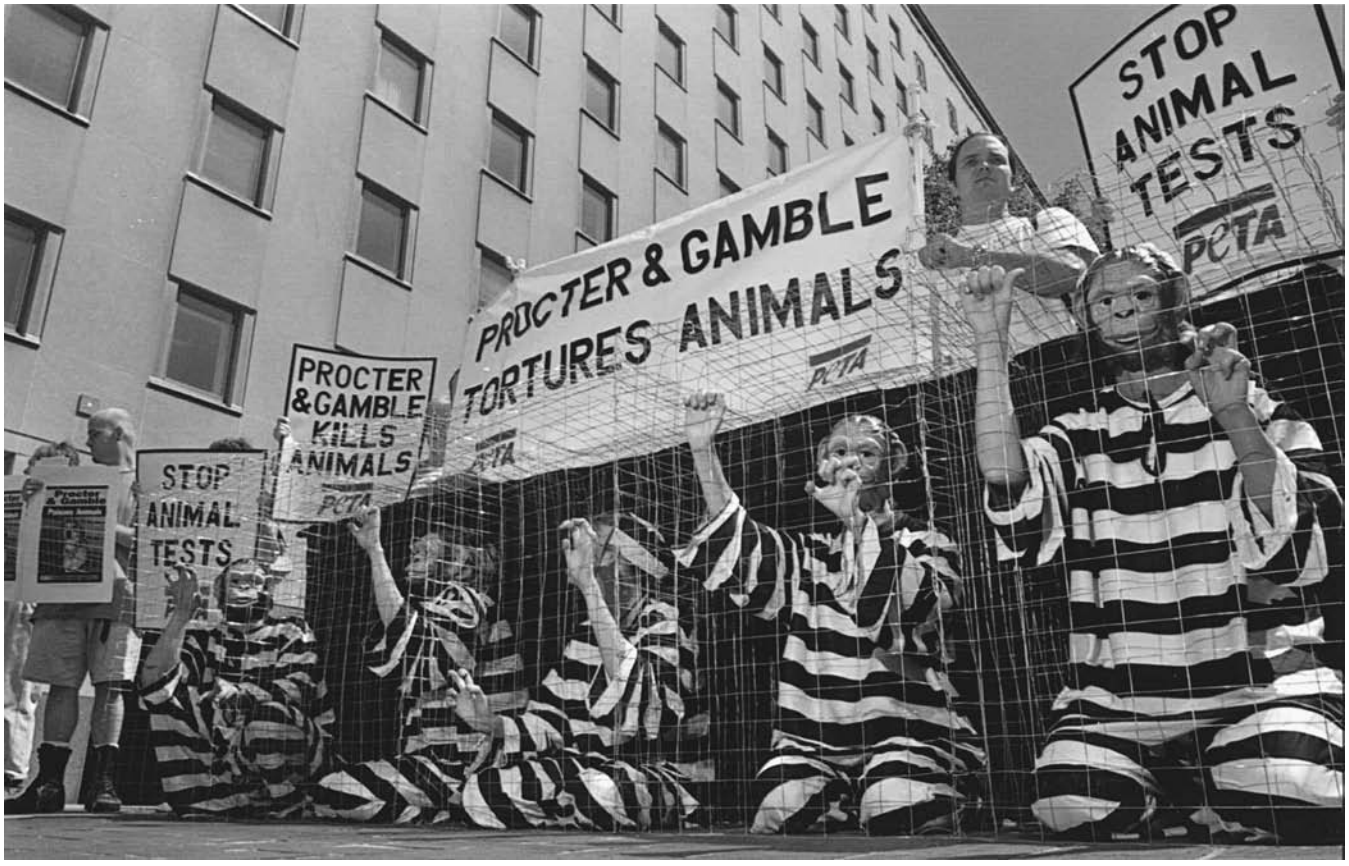
In popular discourse, "the animal rights movement" refers to the wide range of groups and individuals active in organized animal protection. In fact, only a portion of these organizations and individuals are actually motivated by a true theory of animal rights, one that contends that the exploitation of nonhuman animals is immoral in principle and should be abolished. Actually, those who participate in organized animal protection embrace a host of philosophies (animal liberation, ecofeminism, animal welfare, and related variants), pursue a variety of approaches (gradualism, immediatism, and refinement, for example), and work on a diverse range of issues. Nevertheless, at their core, animal advocates share a concern for nonhuman animals and a determination to relieve their suffering.

Even the groups most closely identified with one philosophical approach or another have transcended their presumed positions in case-specific instances. Goals such as the immediate abolition of factory farming or the end of pharmaceutical testing with animals are unrealistic; thus, animal rights campaigns typically focus on egregious practices and rely on education and experience over the longer term to foster an atmosphere in which further proposals for change can be put forward. Some uses of animals simply are more vulnerable than others, and the movement targets them in an effort to meet popular opinion where it is rather than where animal rights philosophy determines it ought to be. The most prominent national organizations generally agree that modest gains in animal welfare are worth securing, even if they do not lead the way toward abolition of animal use.

Although concern for animals has reached unprecedented levels and filtered into legal, regulatory, and social practices, vast areas of animal usage remain beyond the reach of the most basic anticruelty statutes. This reflects the relative power of the interests and industries targeted. Not surprisingly, the movement's efforts to promulgate its principles have met determined resistance. Agricultural concerns, biomedical research interests, furriers, circus owners, hunting enthusiasts, animal fighters, and others have spent millions of dollars in efforts to defend their practices.

The history of organized concern for animals has never been one of linear progress, as the tendency to exploit remains locked in oppositional tension with the impulse to protect them. During the past twenty-five years, the situation of animals in the United States has improved in some ways. Humane societies are doing a better job of curbing unwanted companion animal birth rates. There has been an overall decline in the numbers of animals used in research, testing, and education. Activities like hunting and trapping are in decline. In keeping with a longer trend encompassing the entire twentieth century, moreover, utilitarian attitudes toward animals have generally waned, while moralistic values toward them have increased.

On the other hand, during the same quarter century, intensive confinement agriculture has resulted in historically unmatched levels of animal suffering and death. Agricultural production involves far more animals than any other human use (accounting for as much as 95 percent of total usage), and factory farming is expanding both in the United States and abroad. Animal populations in the wild are threatened, as extinction rates accelerate and expanding human pop-



Wearing monkey costumes and prison stripes, protesters in Cincinnati on August 7, 1997, urge Procter & Gamble to stop testing products on animals. *(AP Wide World Photos)*

ulations make escalating demands upon habitat and resources. Gains in a number of areas are also jeopardized by the advent of global trade agreements that supersede or undercut hard-won protections.

The Emergence of the Anticruelty Movement

Contemporary expressions of concern for animals have a culturally significant predecessor, the anticruelty movement, which flourished during the second half of the nineteenth century and has influenced modern approaches to the issues of animals' status and treatment. Among other things, the modern-day animal movement continues to work within the framework of statutory legislation, which has not changed greatly since nineteenth-century enactments. In addition, certain historical arguments, such as the one that emphasizes cruelty's demoralization of its perpetrator, sometimes carry forward into current debates.

Crucial late eighteenth-century developments in philosophy, religion, and natural history established the capacity to suffer as the most compelling criterion for animals' moral considerability. Sympathy for animals' suffering joined traditional arguments grounded in religious stewardship or worries about the reflexive impact of cruel conduct upon the perpetrator and the society in which he lived. Animal protection societies formed in England (1824), Germany (1837), and France (1846), and the kindness-to-animals ethic found its way into sermons, letters, periodical articles, and didactic literature for children.

From the 1820s onward, a number of American states passed rudimentary anticruelty statutes, grounded in concerns about social order, property protection, aesthetic sensibility, and animals' suffering. Although some people protested the mistreatment of animals during the antebellum years, the abolition of slavery seems to have been a necessary precondition for the emergence of organized animal protection in the United States. The campaign against slavery increasingly stigmatized cruel behavior of

slave masters, with obvious implications for the highly visible abuse and neglect of animals. Even as abolitionism influenced debates over naval flogging and corporal punishment in the schools, it helped to create a context of imaginative sympathy with animals' suffering, and the pre–Civil War decades witnessed occasional protests about public and private cruelty. However, because animals and human slaves shared the status of property, legal, statutory, and other initiatives directed at the protection of animals became easily entangled with the nation's most contentious issue. In some contexts, the argument that these were private concerns prevented discussion, scrutiny, and intervention.

Not coincidentally, the movement blossomed in the immediate post–Civil War years, as the first societies for the prevention of cruelty to animals (SPCAs) formed in New York (1866), Philadelphia (1867), and Boston (1868), with accompanying charters, statutes, and special enforcement powers granted by state legislatures. Growing social concern for the welfare of animals coincided with popular demand for action to alleviate pressing problems that stemmed from the incorporation of animals into the urban industrial environment. Heightened reliance on horses to transport people and goods created enormous traffic congestion and sanitary problems. Periodic roundups of loose-running dogs, inspired by the fear of rabies, created chaos and panic. Drovers led cattle through busy streets in broad daylight. Questionable practices in transportation, milk production, and slaughtering of animals generated deep anxieties about the integrity of the food supply. The removal of dead and dying animals, and the disposal and conversion of offal, by-products, and waste, were a constant preoccupation of municipal authorities. The SPCAs addressed these and other problems in which animals were implicated, and (at a time when professional veterinary medicine in the United States had not yet established itself) provided useful advice and assistance for their care and handling. In all cases, humane advocates sought to interject animals' interests into the debate over how these problems should be resolved.

The movement spread rapidly, and by 1873 twenty-five states and territories had functioning anticruelty societies. The Gilded Age's animal protection had special affinities with temperance and child protection, for all three were concerned with the impact of violence—against spouses, children, and animals. The Woman's Christian Temperance Union established a Department of Mercy in 1891 to distribute humane literature and to encourage its members to support the cause. For their part, child protection advocates advanced their goals through the use of the same statutory approaches—and in some communities, the same organizations—that animal protectionists did. In 1875, after Henry Bergh, founder of the American Society for the Prevention of Cruelty to Animals (ASPCA), personally intervened in a case of severe child abuse, his colleague Elbridge T. Gerry launched the New York Society for the Prevention of Cruelty to Children. In subsequent years, humane societies in many smaller communities incorporated the prevention of cruelty to children and animals into their charters. By 1909, a report of the American Humane Association indicated that there were approximately 348 active societies, including 104 exclusively devoted to animals, 45 to children, and 185 to both concerns.

The early animal protection movement's only legislative achievement at the federal level came in 1873 with passage of the Twenty-Eight Hour Law governing the handling and treatment of animals en route to slaughter. The law specified that cattle in transit be watered, fed, and rested at least once every twenty-eight hours. Humane organizations devoted considerable time and effort to promoting and ensuring compliance, but the law proved a practical failure as railway companies, shippers, and stockmen ignored it. The fact that they faced only modest punishment on those occasions when federal officials acted to enforce the statute did not help either. Eventually, the advent of motor transport of animals to slaughter rendered the law entirely irrelevant.

While endowed with enforcement power, most anticruelty societies quickly shifted from prosecution to education as the best way to prevent animal suffering. Humane advocates emphasized the importance of early childhood socialization and devoted considerable resources to the production and distribution of humane literature. Between 1900 and 1920, they campaigned for compulsory humane education instruction in public schools and succeeded in passing a requirement in approximately twenty-five states.

During the same period, organized animal protection, concerned largely with domestic animals during its first forty years, began to incorporate wildlife issues into its purview. The humane movement's characteristic concerns in regard to wildlife—concern for the pain of individual animals, heightened appreciation for their biological and behavioral needs, and apprehension about the demoralization of those who killed or mistreated them—were manifest in the movement's campaigns against hunting, the steel

trap, zoos and other captive animal displays, and the use of animals in circuses, vaudeville, and cinematic performances.

In the years following World War I, the movement began to decline, as the rationalization and expansion of animal use in such arenas as food and fiber production, and animal research, testing, and education intensified. Always more successful in addressing the cruelty that individuals committed, animal protectionists found it difficult to wage effective campaigns against institutionalized usage on a mass scale. Targeted interests also succeeded in gaining exemptions from anticruelty statutes, placing entire categories of animal use outside the reach of reformers.

As the horse gave way to the automobile, animal protection groups shifted their focus to the numerous problems associated with companion animals, working to curb overpopulation, providing a humane death to unwanted dogs and cats, promoting basic veterinary care, and enforcing anticruelty statutes. In one community after another, humane societies assumed responsibility for municipal animal control. The decision of many local societies to assume this burden complicated the challenge of advancing humane standards in more controversial arenas. The problem of companion animal overpopulation took up much of the movement's time and resources. Anticruelty societies provided kennel space, facilities, and hospitals to house, treat, and euthanize animals. Such commitment of their resources precluded any possibility of their continued pursuit of national goals such as humane slaughter, the abolition of the leghold trap, and the regulation of animal use in laboratories.

During the middle decades of the twentieth century, the American Humane Association (AHA), which served as the umbrella organization for the nation's animal protection societies, focused most of its attention on the animal control issues that preoccupied its membership. Although the AHA never fully relinquished the broader concerns of the nineteenth-century movement, it failed to invest significant resources in their advancement. Animal protection thus became a staid and largely uncontroversial movement that attended to the problems of pet keeping. It was highly decentralized, inasmuch as most SPCAs were not formally linked to one another. It had no federal agenda and no presence in Washington, D.C. There were no federal anticruelty statutes, as in other nations, and the movement had gained negligible regulatory and legislative success at the federal level in three-quarters of a century.

During its first seventy-five years as a social movement, animal protection was relatively successful in stigmatizing individual cruelty as demoralizing and socially dangerous, and in promoting the idea of kindness toward animals as a desirable attribute of a well-balanced personality. On the other hand, the movement did not respond well to the use of animals in institutional contexts where abuse and neglect were largely invisible to the public. The humane movement's traditional categories of cruelty and kindness were in some ways inadequate to encompass animal use in these new areas.

Although animal protection was not a politically radical movement, animal protectionists did undertake an ambitious agenda of reform that encompassed the realms of transportation, sanitation, recreation, fashion, food production, science, education, conservation, labor, and commerce. Its concerns sometimes intersected with those of middle-class campaigns for public health, urban order, temperance, child rescue, food safety, railroad regulation, Americanization, public education, conservation, country life, bird preservation, nature study, and the protection of patients from unethical medical procedures.

It is worth noting, too, that its advent marked a crucial benchmark in the evolution of human ethics. Nineteenth- and early twentieth-century animal protectionists were responsible for launching the first historically meaningful initiatives to expand moral concern beyond the species barrier. Their extension of moral consideration to nonhuman life set a precedent whose implications continue to unfold in the early twenty-first century.

The Renaissance of Humane Work

After World War II, converging trends in demographics, animal utilization, science, technology, moral philosophy, and popular culture laid the groundwork for the humane movement's renaissance. Disturbed by the atrophy of the movement's once broad agenda for reform, two new organizations, the Animal Welfare Institute (1951) and the Humane Society of the United States (1954), entered the field. They revived early twentieth-century initiatives for humane slaughter, the regulation of laboratory animal use, and the abolition of the steel leghold trap, and set their sights on national legislation. The new organizations adopted moderate and gradualist approaches, advancing ideas for regulatory change, federal intervention, and reform of specific practices that resulted in unnecessary suffering or abuse.

The controversy over using pound animals in research, testing, and education was a crucial factor in

the movement's revitalization. During the 1950s, increased expenditure on biomedical research resulted in growing pressure from scientific institutions for access to pound and shelter animals. Efforts to force compliance upon humane societies provoked serious objections within the humane community, and animal advocates fought hard to overcome pound seizure legislation.

In 1958, organized animal protection secured its first federal victory in eighty-five years, the Humane Methods of Slaughter Act, confronting opposition from industry and Jewish organizations to secure a law that prohibited the practices of hoisting and shackling conscious animals and the use of poleaxes (manually wielded sledgehammers) for stunning. Kosher slaughterhouses were immune from the law, which specifically defined *shehitah* (kosher slaughter) as humane. The Humane Methods of Slaughter Act specified that "No government agency may buy meat or meat products from any packer who in any of his plants, or a plant of any subsidiary company, slaughters animals inhumanely or handles animals inhumanely in connection with slaughter." When the law passed, the government was purchasing about $300 million worth of meat per year, and the provision affected most of the nation's largest packers.

In the early 1960s, the humane movement set its sights on enactment of legislation that addressed the treatment of animals in laboratories. Despite determined opposition from the biomedical research community, the Animal Welfare Act passed, making it a federal crime for any facility to purchase or transport dogs or cats in interstate commerce without a license from the U.S. Department of Agriculture (USDA), and to require research facilities to purchase animals from licensed dealers. It also required research facilities and dealers to keep records of purchase, sale, transportation, identification, and previous owners' shipping of the animals. In addition, it set standards for housing, feeding, sanitation, ventilation, separation by species, and adequate veterinary care.

In both of these campaigns, animal welfare organizations made skillful use of elite political connections to combat the extraordinary advantages enjoyed by their targets—well-financed and influential interests with strong ties to the national legislature. At the same time, animal protection began to build a grassroots base. By the 1970s, the movement had become more sophisticated in its efforts to generate popular political pressure, and there were a number of major new organizations in the field, including Alice Herrington's Friends of Animals (1957), Helen Jones's National Catholic Society for Animal Welfare (1959), Cleveland Amory's Fund for Animals (1967), Belton Mouras's Animal Protection Institute (1968), and Brian Davies's International Fund for Animal Welfare (1969). Several of these groups began to speak of animals' "rights" in their promotional literature, and Jones reincorporated her organization as the International Society for Animal Rights in 1980 to reflect the changing rhetorical and philosophical landscapes.

Wildlife concerns, which had received only limited attention from the pre–World War II movement, gained an increased share of attention during the 1960s. Rising social interest in wildlife protection, perhaps spurred by the explosive growth of the human population, the development and depletion of natural resources, and an unprecedented destruction of habitat, led environmental organizations to emphasize animals' interests, too, and some species became iconic in environmental campaigns. Whales, seals, dolphins, and pandas all became symbols of international campaigns to protect animals and the environment.

A crucial trend of increased scientific interest in animal consciousness also influenced the course of animal protection. From the 1950s onward, pioneering ethologists following in the path of Konrad Lorenz and Niko Tinbergen introduced the scientific method to field study, and their naturalistic studies of animal behavior demonstrated the complex mental and emotional capacities of nonhuman animals. This knowledge filtered into media programming and published works, spurring broad popular interest in animals. The pronounced anthropomorphism of some programs, imputing human qualities to nonhuman animals (as in "Bambi" or "Lassie") shaped popular sympathy and attitudes as well.

The rise of ethology as a scientific field also generated serious philosophical debate concerning animals' cognition, subjectivity, and moral status. During the late 1960s, the question of human obligations to nonhuman animals became a topic of discussion within academic philosophy. The publication of Peter Singer's *Animal Liberation* in 1975 provided a crucial stimulus. Although other works preceded it, *Animal Liberation* nevertheless marked the historical moment at which the question penetrated the broader public sphere. Singer provided the cause with a rational ideology that sought to stigmatize speciesism as a form of discrimination, like sexism or racism. Singer's work—part philosophy lesson, part activist manual, part cookbook—gave the animal movement an ideological framework broad enough to encompass nearly

all of its factions. Although Singer did not advance a theory of "rights," many have dubbed his book the "bible of the animal rights movement."

The Animal Rights Era Begins

Henry Spira, a New York schoolteacher with a long background of labor activism, was one of those influenced by *Animal Liberation*. In 1976, Spira launched Animal Rights International in order to apply the strategic principles of the postwar era's rights-based movements to the problem of animal suffering. Spira's ability to mobilize diverse factions brought stunning success to a cause that had seen very few clear victories before his involvement. After Spira-led campaigns ended controversial experiments at the American Museum of Natural History, overturned much-hated pound seizure legislation in New York State, and persuaded major cosmetics companies to invest in nonanimal methods research, other activists began to emulate his approach. During the course of these and related campaigns, popular discourse began to acknowledge the movement's adherents as "animal rights advocates" rather than "animal lovers."

By the 1980s, a significant cycle of group formation was in full swing. The emerging organizations, such as People for the Ethical Treatment of Animals (PETA, 1980), Trans-Species Unlimited (1981), In Defense of Animals (1983), and Last Chance for Animals (1985), adopted challenging rhetoric and tactics, transforming animal rights into a grassroots-based movement for the first time. Community-level groups formed all over the country, as a new generation of activists pushed the issues with direct action techniques and dramatic campaigns that targeted laboratory animal facilities, circuses, rodeos, fur salons, bird shoots, restaurants, and other sites. By 1984, civil disobedience, site blockage, and sit-ins were common tactics. Advocates even went into the woods to challenge the constitutionality of "hunter harassment legislation" passed in a number of states. The issue of animals' treatment gained ground in the media.

More than any other group, PETA represented the new militancy and hard-edged campaign style typical of the new era. In 1981, the group launched an undercover investigation of a primate researcher in Silver Spring, Maryland. Just three years later, the organization drew virtually the entire cohort of humane organizations into a similar investigation of head injury research involving baboons at the University of Pennsylvania School of Medicine, with disturbing videotape evidence generated by the experimenters themselves. PETA sought to advance the cause through a host of controversial tactics and campaigns.

Outside of a department store in East Grand Rapids, Michigan, on December 30, 1997, fur-dressed members of People for the Ethical Treatment of Animals sit in cages to protest the overcrowding of animals on fur farms. *(AP Wide World Photos)*

The Humane Society of the United States (HSUS), on the other hand, embodied the movement's increasing professionalization, employing a learned cadre of staff members with academic and scientific credentials in specialized disciplines that focused on animals and their well-being. The HSUS and other older groups continued to operate with rhetorical restraint and generally moderate goals, while trying to develop greater access to policy networks where decisions about animal use were being made. However, the advent of a burgeoning grassroots movement in the 1980s also sparked innovation and dynamic change in their approaches. They, too, were strengthened by the groundswell of interest in the issues and assumed an important role in providing assistance and advice to activists at all levels.

In the wake of the research scandals in Maryland and Pennsylvania, advocates seeking to strengthen the Animal Welfare Act succeeded in the passage of

the Dole/Brown amendments (1985). This new enactment added community representatives to the animal care committees of institutions that employed animals in research. The Dole/Brown amendments also required minimum standards for physical environments to ensure animals' psychological well-being in captivity, sparking opposition from animal laboratories on the grounds of excessive cost and inconvenience.

By 1985, nurtured by professionals within and outside of the movement, and driven by rising popular concern about animals, a science of animal welfare emerged, drawing on ethology, veterinary medicine, psychology, and other disciplines. Applied animal welfare science began to exert a significant impact on the debate over animal use in a wide variety of areas. The movement's effort to institutionalize the alternatives approach in research, testing, and education was instructive. As targeted industries discovered the financial, scientific, and time-saving advantages of newer techniques, the search for nonanimal methodologies developed its own momentum and gained credibility with corporate, government, and academic scientists charged with policy and development.

Animal rights advocates have frequently sought to link their cause to the African-American freedom struggle and the women's rights campaigns of the second half of the twentieth century. These movements undoubtedly had an influence on many supporters, even though the formal links between animal rights and other social reforms have been and remain minimal. The rights-based movements of the post–World War II period have certainly provided animal rights advocates with a "master frame"—a frame of reference through which those involved with a given reform envision and characterize their objectives, a sense of agency and moral urgency, and an array of useful tactics, mobilization techniques, and strategies. Even though sociology has generally characterized animal rights (along with antinuclear politics and environmentalism) as "a new social movement"—one that draws together people whose own lives and rights are basically secure but who nevertheless share views about the importance of changes in social, cultural, and political consciousness—many participants do conceive of animal rights as a justice-based movement.

Scholarship on the social composition of the animal rights movement has waned in recent years, but some conclusions were common to all of the studies undertaken between 1975 and 1995. Women have greatly outnumbered men in levels of participation. The majority of animal rights advocates are white and are from middle- and upper-class backgrounds. They generally enjoy higher levels of education than most Americans, and they are not associated with traditional religious institutions. A high percentage have companion animals in their homes.

The Animal Rights Movement in the Twenty-first Century

During the last decade of the twentieth century, the movement began to shift from grassroots protest toward the penetration of policy networks where it could exert a greater long-term influence on laws and regulations governing animal use. Although attempts to secure legislation frequently failed, they sometimes helped to drive an issue in the right direction, highlighting cruel practices in the slaughtering industry or the unnecessary duplication of experiments, for example. At the same time, the movement's legislative and regulatory achievements did not typically redress the fundamental defect of many extant statutes—that certain species are omitted from coverage. Despite their vast numbers and their demonstrated capacity to suffer, poultry are not protected under the Humane Slaughter Act, and mice and rats are not protected under the Animal Welfare Act.

The movement faces special problems in making use of antiquated statutes containing explicit exemptions for broad areas of animal usage. Probably in no other arena of social significance has statutory law remained as static as animal protection. In an encouraging trend, animal organizations have succeeded in their recent efforts to upgrade violations of state anticruelty statutes to felony status. The HSUS and the Fund for Animals have also teamed up in over a dozen successful ballot referendum initiatives at the state level, allowing voters to impose limits on cruelty even if their elected representatives have declined to do so.

In the United States, the challenge of securing standing to sue has been a major obstacle for advocates seeking to make use of the courts. The Animal Legal Defense Fund worked diligently on this problem in a series of cases heard during the 1990s. Launching the Great Ape Project, an international coalition sought to gain three basic rights for chimpanzees, bonobos, gorillas, and orangutans—not to be deprived of life, not to be subjected to torture or cruel treatment, and not to be subjected to medical or scientific experimentation. By the year 2002, the campaign for animals' legal personhood had made

significant inroads within several national constitutions and statutory frameworks. Although the situation had not progressed so far in the United States, a record number of law schools were offering animal law courses, and the author of one popular title—*Rattling the Cage*—was arguing for the legal personhood of some animals on the basis of their complex consciousness.

In the 1990s, Henry Spira began to apply his strategies to the use of animals for food, and during the same decade a handful of single-issue organizations like the Farm Animal Reform Movement, Farm Sanctuary, the Humane Farming Association, and United Poultry Concerns made important efforts to shift the movement's focus to the suffering of cows, pigs, chickens, and other domestic animals consumed as food. In this arena, anticruelty statutes cede determination of what is cruel entirely to the industries that use them, and not surprisingly, concern for the physical and psychological well-being of animals is the lowest priority. By 1998, the number of animals killed for food neared 9.5 billion.

As bad as things appeared, there were hopeful signs on the horizon. A cluster of promising and effective organizational strategies devoted to farm animal concerns had emerged. Several major fast-food chains acquiesced to campaigns that pushed them to enforce animal welfare standards upon the companies that supplied them meat. For the first time, the devastating environmental impact of factory farming began to attract serious attention from major environmental organizations. Finally, millions of Americans began to modify their diets in accordance with concerns about global hunger, environmental loss, animal welfare, and personal health, a trend that resulted in an expanding and self-sustaining "humane economy" that both supplies and reinforces marketplace expressions of affinity with animals.

Certain topics in animal rights remain contentious. A significant minority of activists believe that the principles of animal rights are violated by anything less than abolitionist perspectives and strategies, and have sternly criticized the broader movement's pursuit of limited measures that, it is argued, entrench animal use rather than weaken it. A robust internal debate about illegal actions has also characterized the last two decades. Although a few individuals believe that animals should be liberated "by any means necessary," illegal actions comprise a very small part of the movement's activity, and violent actions virtually no part at all.

In fact, over just two decades, the animal rights movement's critique of institutional usage of animals has become familiar and even conventional. During that time, the movement has prompted serious discussion of the moral status of animals, stimulated a science of animal welfare, reduced or eliminated several categories of animal use, made strong inroads into popular culture, and gained modest influence in relevant public policy networks. In addition, the movement has consistently sought to frame its issues in the light of broader reform concerns. Quite apart from the ethical challenges they have raised, animal advocates have highlighted questions of immense practical importance for human beings, like sustainable food policy, effective programs for ensuring product safety, and environmental preservation. Fueled by the diffusion of its values into popular culture, higher education, literature, and the arts, the movement's efforts seem likely to bring the status of animals into sharper focus as these and other major issues are addressed in the future.

Appropriate Technology Movement

Although the historical roots of the American appropriate technology (AT) movement run deep in American soil, the AT movement proper originated with British economist E.F. Schumacher's efforts during the late 1950s and early 1960s to formulate an alternative strategy of economic development for the Third World. Drawing on the philosophy and economic ideas of Mohandas Gandhi and on his own experience as a development consultant for the government of Burma (Myanmar), Schumacher attributed the intractability of Third World poverty to development strategies based on Western models of industrialization. The relatively abrupt introduction of complex, highly capitalized technologies into countries lacking a commensurate technical and institutional infrastructure, he argued, actually accelerated the depopulation of rural areas and undermined whatever industry had taken hold there while pushing villagers toward already overcrowded cities. The result was heightened poverty, increased economic dependence on industrialized nations, and the careless destruction of fragile ecosystems and traditional cultures. At the core of Schumacher's program was a call for technology "appropriate" to the context in which it was to be deployed. In the developing world, this meant technologies that were small in scale, democratically controllable, labor (rather than capital) intensive, environmentally sustainable, and adaptable to local cultural conditions.

E.F. Schumacher and Appropriate Technology

In 1965, Schumacher and a small group of like-minded individuals formed the Intermediate Technology Development Group (ITDG) to put the concept of "intermediate" technology—which would soon be renamed "appropriate" in order to avoid any suggestion that it was second-rate—into practice. Enthusiasm for the ITDG's approach to development soon gave rise to an international social movement with its own organizations, publications, and projects. Hundreds of AT organizations came into existence during the 1970s (author and historian Kirkpatrick Sale places the number at over 2,000 by 1980) and began working with private investors, foundations, universities, governments, international aid agencies, and United Nations organizations.

With the movement well under way in the international development arena (although still hovering around the periphery of mainstream development thinking), Schumacher and his colleagues began to turn their attention to the "overdeveloped" countries of the industrialized world. The notion that appropriate technology might be applicable to industrialized nations was implicit from the start in the movement's critique of conventional development strategies. Although that critique grew out of a concern over the transfer of environmentally and socially destructive practices to the developing world, the practices themselves were the product of nearly two centuries of industrial development in what is now called the First World. Schumacher and his colleagues acknowledged that industrialization had brought great prosperity to the societies in which it had taken root, but they were quick to add that the environmental and social costs of this prosperity—resource depletion, pollution, growing inner-city and rural poverty, and so on—were becoming increasingly unsustainable. By the late 1960s, appropriate technologists suggested that the insights they had honed in developing nations could provide the basis for a social and environmental renewal in the industrialized world as well.

That appropriate technologists began to focus their attention on the industrialized world—and particularly on the United States, as the leading industrial nation—follows logically from the premises of appro-

priate technology itself. What is less clear is why so many Americans—including President Jimmy Carter, who invited Schumacher for a private White House consultation—found the concept attractive. Why, in other words, did a movement seeking to place limits on technology resonate in a country so clearly enamored of industrial progress? The movement's appeal owed much to a tradition of decentralist thought and action running from Thomas Jefferson, the Populists, and Henry George through Lewis Mumford, Ralph Borsodi, Dwight Macdonald, Paul Goodman, Murray Bookchin, and others. It also owed a good deal to World War II, which represented a watershed in the development and criticism of large-scale technology and the concomitant centralization of political and economic power. Much of the intellectual debate during the 1950s was driven by fears that these developments had given rise to a "mass society" that threatened to undermine democratic institutions, meaningful work, and a rich and varied culture. Fueling these fears was the emergence of an unprecedented postwar alliance of science, industry, and government—what President Dwight Eisenhower eventually dubbed the "military-industrial complex." That alliance spurred a number of developments that would become future targets of the AT movement, including the creation of a nuclear energy industry and the dramatic acceleration of industrialized agriculture. For all of these reasons, Americans had become increasingly receptive to the AT movement's argument for technological restraint.

Small Is Beautiful

The 1960s and 1970s provided particularly fertile ground for the growth of the AT movement. The movement burst onto the American scene (thanks largely to the publication of Schumacher's immensely popular book, *Small Is Beautiful: A Study of Economics As If People Mattered*, in 1973) just as large numbers of Americans were becoming aware of the dangers of chemical toxicity and suburban sprawl, and just as the nation entered a period marked by recurrent energy crises, nuclear accidents, stagflation, and worsening inner-city and rural poverty. The arrival of the AT movement also coincided with a painful military defeat in Southeast Asia, made all the more humiliating by the overwhelming technological superiority of the American armed forces. Beyond the defeat itself, the immense technological destruction inflicted on Vietnam and Cambodia suggested—at least to those who opposed the war—that the American notion of technological progress had somehow gone awry. This concern had already surfaced in the political and cultural rebellions of the 1960s, both of which contributed significantly to American enthusiasm for appropriate technology. Indeed, by the time Schumacher arrived in America to promote his book, an indigenous appropriate technology movement—in conception if not in name—had already emerged out of the late-1960s confluence of new leftist and countercultural activity. Consequently, Schumacher found in this country a relatively small but highly receptive audience.

The AT movement had much in common with the New Left. A number of prominent American appropriate technologists took part in the nuclear disarmament, civil rights, free speech, and antiwar movements. More important, the AT movement as a whole shared the New Left's commitment to participatory democracy, its ambivalence toward the centralized power of the liberal state, its uneasiness over the disparity between American material abundance and Third World poverty, and its conviction that "the personal is the political." Despite its affinities with the New Left, however, the AT movement drew more heavily on the counterculture for its inspiration. To begin with, the New Left's calls for violent Socialist revolution, which came just as the indigenous American AT movement was beginning to coalesce, were completely alien to the AT movement's ideological sensibilities. And while the New Left focused primarily on mobilizing oppressed constituencies to confront established institutional power directly through demonstrations and acts of civil disobedience, the counterculture sought to bring about social change by creating alternative institutions—food and craft cooperatives, free schools and clinics, small businesses, and so on—aimed at forming a new culture in the shell of the old. Although the New Left and counterculture converged in many respects as the 1960s progressed, it was the counterculture's emphasis on prefigurative institution building, rather than the New Left's emphasis on confrontation, that provided the more important model for appropriate technologists.

The most immediate impetus for the emergence of an indigenous AT movement in the late 1960s was the counterculture's impulse to go "back to the land." Frequently lacking the skill, knowledge, and tools necessary for self-reliant rural living, back-to-the-landers created a set of needs addressed most famously by Stewart Brand's *Whole Earth Catalog*. The catalog quickly became a defining icon of the counterculture and a major clearinghouse for the hardware and ideas of the budding AT movement. Although

Schumacher Society. *(Photo by Hilda Maingay, courtesy of the E.F. Schumacher Society, Great Barrington, MA, www.smallisbeautiful.org)*

Brand and several other members of the Whole Earth circle eventually abandoned the AT movement to promote the wonders of a high-tech corporate economy (following in the footsteps of their intellectual mentor, iconoclastic architect and designer Buckminster Fuller), the *Whole Earth Catalog*'s successor publications, the most recent of which is a quarterly entitled *Whole Earth*, remain an important venue for many appropriate technologists.

Organizational Growth and Alliances

Appropriate technologists established a wide array of organizations, most of which reached maturity during the 1970s and 1980s, and many of which still exist today. Some have worked in rural settings, such as the Land Institute in Salina, Kansas, and the federally funded Appropriate Technology Transfer for Rural Areas (ATTRA) in Fayetteville, Arkansas. Others have worked in urban settings, such as the Center for Neighborhood Technology in Chicago and the Institute for Local Self-Reliance in Washington, D.C., and Minneapolis. Although most AT organizations have operated in the nonprofit sector, the National Center for Appropriate Technology in Butte, Montana (of which ATTRA is an offshoot) was established by the federal government, although it has had to rely increasingly on foundation grants and for-profit consulting since the budget cuts of the Reagan era. Still other AT organizations—notably the Real Goods Trading Company in Willits and Hopland, California—have taken the form of for-profit corporations, albeit with an educational and social mission.

The goals and strategies of AT organizations also vary widely. The movement is best known for the development and dissemination of appropriate hardware, ranging from composting toilets to renewable energy technologies. Perhaps the most far-reaching effort along these lines—and one that clearly reflects the

ideological bent of the movement—is the New Alchemy Institute's (NAI) development of "bioshelters." Designed as enclosed ecosystems integrating agriculture, aquaculture, and renewable energy, these "living machines," as they were later called, consist of carefully arranged plants, fish, and microorganisms housed in solar-powered greenhouses. John Todd, cofounder of the NAI and Ocean Arks International (NAI's successor organization), envisions this emergent technology not only as a means of transforming houses from energy sinks into food- and energy-producing units (NAI's original goal), but also as a means of purifying industrially polluted water, treating sewage, reversing desertification, providing a sustainable alternative to industrial agriculture, promoting individual and community self-reliance, generating useful employment in low-income areas, and alleviating world hunger.

Although the majority of AT organizations have focused on concrete technologies, others have devoted themselves to establishing an array of appropriate institutions intended to work hand in glove with appropriate hardware. Leading the way in this effort has been the E.F. Schumacher Society in Great Barrington, Massachusetts, which has actively promoted the proliferation of small farms and businesses, cooperatives, community land trusts, local currencies, and decentralized banking systems responsive to the needs of low-income communities in both rural and urban areas.

Still other AT organizations—notably the Rocky Mountain Institute (RMI) in Snowmass, Colorado—have focused on the difficult task of enticing and pressuring multinational corporations to act in accordance with the environmental and social goals of the AT movement. Although this effort does not reflect—and perhaps even conflicts with—the anticorporate ideology of the AT movement, even the more radical AT organizations view the RMI's work as essential, if only to stave off ecological catastrophe until a more equitable and sustainable set of economic institutions can be created.

Ecology and Revitalization of Rural Society

The American AT movement overlaps with several other postwar social movements and bears a particularly close relationship with the environmental movement. Indeed, the AT movement is frequently described as a subset of the environmental movement, largely because appropriate technologists have focused on developing a technology in harmony with, and in some cases modeled on, natural systems. Appropriate technology, in this view, is simply "green technology." Yet this interpretation obscures more than it explains. To begin with, the environmental movement is itself divided between reform environmentalism and radical ecologism, and radical ecologism is further divided between "deep" and "social" ecology, among other tendencies. Although appropriate technologists have drawn heavily on a few of the ideological strains running through radical ecologism—especially bioregionalism and Murray Bookchin's version of social ecology—they have rejected both deep ecology's overwhelming emphasis on wilderness preservation and reform environmentalism's failure to push for systemic social change. Even Bookchin, whose brand of social ecology is the environmental movement's closest analogue to the AT movement, has devoted most of his energies to advancing an "eco-anarchist" political transformation that few appropriate technologists have embraced with any fervor. More broadly, outside of Bookchin's small circle of social ecologists and a nascent environmental justice movement, environmentalists have expressed little interest in issues of social equity. In contrast, appropriate technologists have long given equal weight to environmental sustainability and social equity. So while the AT and environmental movements are closely related, they are best understood as distinct phenomena.

The AT movement is also closely related to the sustainable agriculture movement. Indeed, the two are so closely linked that it is frequently impossible to tell them apart. Several prominent AT organizations—including the New Alchemy Institute on Cape Cod, the Farallones Institute in northern California, Karl Hess's Community Technology in Washington, D.C., the E.F. Schumacher Society, the Center for Neighborhood Technology, and others—have devoted their energies to developing and promoting sustainable agriculture. Similarly, several prominent sustainable agriculture organizations—notably the Land Institute in Salina, Kansas, and the Center for Rural Affairs in Walthill, Nebraska—have combined their agricultural work with the development and advocacy of appropriate technology. It should also be noted that a number of appropriate technologists have suggested that sustainable agriculture is itself an appropriate technology.

Appropriate technologists working in the countryside have not only developed techniques and hardware suitable for sustainable agriculture, but they have also pushed for public policy reforms aimed at

weakening the corporate grip on agriculture, reversing the concentration of land ownership, revitalizing rural communities, and promoting ecological farming. For example, the Center for Rural Affairs, which is widely recognized for its efforts to help small farmers develop and adopt renewable energy technologies, is also the premier family farm advocacy group in the country, regularly sending its representatives to Washington to testify before congressional committees and mounting local, state, and national campaigns to persuade voters to press their elected officials for reform.

Appropriate technologists' abiding interest in sustainable agriculture derives directly from their effort to restore and protect the economic integrity of rural areas. They are convinced that this will require not only the development of a new technological basis for rural manufacturing, but also the reversal of the rapidly escalating industrialization of agriculture. The more farmers spend on expensive machinery and chemical inputs from the city, the less they retain in profits that might otherwise be spent and respent within the rural economy. As a result, appropriate technologists argue, rural communities are rapidly becoming impoverished internal colonies as overgrown cities drain their resources and then dump cheap goods into their vulnerable markets. Appropriate technologists working in sustainable agriculture have thus made the substitution of ecological knowledge and small-scale technology for expensive off-farm inputs an important element of their strategy for rural economic development.

Although appropriate technologists have been deeply concerned with the revitalization of rural communities and have frequently called for "decentralization" (the meaning of which is a subject of considerable debate within the AT movement), they are no more anti-city than they are anti-technology. In both cases, they simply seek a sustainable and equitable middle road between primitivism and overdevelopment. From the AT movement's perspective, the question is not whether cities should continue to exist, but rather what form they should take, both technologically and politically. Rejecting the giant, sprawling megalopolis, appropriate technologists instead tend to advocate small and medium-sized cities capable of providing cultural, educational, and economic stimulation without overwhelming rural communities. Overlapping with the "new urbanism" of Peter Calthorpe and others, the AT movement has also advocated an infill strategy for renovating suburbia that would result in densely settled, clearly articulated communities in which residential life and commercial activity are tightly integrated, industrial activity is carefully tailored to the ecological requirements of the landscape, and easily accessible public spaces encourage a vibrant civic life while providing ample opportunities to appreciate and use nature.

Conclusion

Within cities themselves, a number of AT organizations have worked to revitalize impoverished neighborhoods by promoting material self-reliance and thus protecting them from the same extractive corporate economy that threatens the countryside. Strategically, this effort began by establishing a range of neighborhood-level institutions promoting democratic participation and neighborhood self-reliance in energy, food, shelter, and other basic needs. In the long run, however, urban AT organizations have shifted away from neighborhood self-reliance toward the more realistic regional approach of developing symbiotic relationships between *partially* self-reliant inner-city neighborhoods and sustainable farms in nearby urban hinterlands. Some AT organizations have moved beyond the movement's preference for prefigurative politics to mount citywide opposition to various mega-projects—sports arenas, redundant airports, and, in the case of Chicago's Center for Neighborhood Technology, the "Deep Tunnel" drainage system—that divert municipal funds from impoverished neighborhoods. Similarly, they have campaigned to end red-lining in the banking industry.

In whatever context it has operated, the AT movement has been guided by a social vision emphasizing democratic participation, ecological sustainability, and a widespread distribution of productive wealth. Without rejecting cities, technology, or even ethically constrained market mechanisms, the movement has instead taken aim at the technological gigantism and concentration of wealth accompanying corporate capitalism. Against that economic system and its degradation of both human and ecological communities, appropriate technologists have held out hope for a more sustainable relationship with nature and a more equitable distribution of the fruits of industry and agriculture.

Lesbian, Gay, Bisexual, and Transgender Movement

Introduction

Although the lesbian, gay, bisexual, transgender (LGBT) civil rights movement has made enormous progress politically in the United States since the end of World War II, especially in changing public attitudes and working with elected officials, the policy issues that most concern LGBT persons remain very much the same. The most important are employment discrimination, marriage, and military service. Sodomy laws remained on the list until June 2003, when the United States Supreme Court overturned its 1986 *Bowers v. Hardwick* decision as part of a decision, *Lawrence v. Texas*, striking down the Texas state sodomy law, and, by implication, all sodomy laws.

Sodomy

U.S. Supreme Court justice Antonin Scalia verified the importance of sodomy laws for the LGBT civil rights movement with his dissent in *Romer v. Evans* (1996). The majority opinion in that case struck down Colorado's Amendment 2, a popular initiative amending the state constitution to repeal all existing LGBT civil rights laws in the state and prohibit the enactment of future ones. Noting the majority's failure to address the 1986 *Bowers v. Hardwick* decision, in which the Supreme Court upheld Georgia's sodomy law against a challenge based on privacy rights, Scalia argued that, if states could prohibit the conduct that defines the class, it was absurd to suggest that states could not also regulate the class in virtually any other manner they saw fit.

Most sodomy laws went largely unenforced. Even without actual prosecutions, however, they could have effects on LGBT persons by creating the presumption that such persons are criminals and by installing official hostility to them in the law. Reasoning similarly to Justice Scalia, legislators and state judges sometimes took the existence of a sodomy law as an indication that the people of the state could and should discriminate against LGBT persons in other ways. State judges denied custody to LGBT parents simply by noting that such parents presumably violated the state's sodomy law, making them unfit.

Until 1961, every state plus the District of Columbia prohibited sodomy, variously defined. The first spate of repeals, beginning with Illinois, resulted not from LGBT social movement activity but from a drive to overhaul penal codes in all states under the auspices of the American Law Institute, which considered consensual, noncommercial sexual activity a private matter that states should not regulate. Many states resisted this change, however. Given the Supreme Court's apparent elaboration of a right to privacy in various cases dating back to 1965, LGBT activists expected it would strike down state sodomy laws all at once given the opportunity. In 1986, however, in *Bowers v. Hardwick*, the Court upheld Georgia's sodomy law against a privacy challenge.

Although this seemed like an enormous setback for the movement at the time, it led to a spate of challenges to sodomy laws under state constitutions, which succeeded in Kentucky, Montana, Minnesota, Tennessee, and, ironically, Georgia (state courts in Alaska, New Jersey, New York, Oregon, and Pennsylvania invalidated sodomy laws before *Bowers v. Hardwick*). Although most observers considered state court challenges the only viable route to eliminating sodomy laws, activists in Rhode Island achieved legislative repeal in 1998 in part by cooperating with disability rights activists, who explained to legislators that for many persons with motor impairments, acts prohibited under the statute were their only means of sexual gratification.

A prosecution in Texas for sodomy led to *Lawrence v. Texas*, which the United States Supreme Court decided in June 2003. Few Supreme Court decisions better illustrate the impact of a social movement than *Lawrence*. Nothing about the law had changed in the seventeen years since *Bowers* except that four states, including Texas, had adopted sodomy laws directed exclusively at same-sex couples. In a concurring opin-

ion, Justice Sandra Day O'Connor pointed to the fact that the Texas statute discriminated on its face against same-sex couples to argue for overturning that statute on the basis of the Constitution's guarantee of equal protection of the laws. Her logic would have left sodomy laws standing in those states where they did not specify same-sex couples.

In the majority opinion, by contrast, Justice Anthony Kennedy explicitly overturned *Bowers*, arguing that the Constitutional right to privacy included the right of consenting adults to enjoy what forms of sexual intimacy they chose without interference from the state. In the long run, what may be more significant than the result was the fact that Kennedy couched his decision in terms that bespoke substantial respect for LGBT persons and their relationships, in sharp contrast to the condemnation that rang forth from the majority opinion in *Bowers*. He also relied heavily on the arguments of LGBT historians that the automatic connection between sodomy as act and "homosexual" as identity that Scalia took for granted was in fact a relatively recent invention, making doubtful the claim that our society has long used sodomy laws as the mechanism to express its disapproval of LGBT persons. It is hard to escape the conclusion that six justices voted to strike down the Texas sodomy law seventeen years after five justices voted to uphold Georgia's sodomy law, primarily because more justices knew more LGBT persons in 2003 than in 1986.

Employment Discrimination

Employment discrimination became a major issue immediately after World War II as members of Congress strove to purge LGBT employees from the federal bureaucracy during the second Red Scare. In the anti-Communist zeal of the 1950s, many corporations followed the federal government's lead in characterizing LGBT employees as threats to national security. A leading LGBT activist, Franklin Kameny, became an activist after being fired from the Army Map Service in 1957. The federal Civil Service Commission, bowing to a federal appeals court decision, officially announced on July 3, 1975, that it would no longer consider LGBT identity a bar to federal employment.

New York Democratic Representative Bella Abzug introduced a bill in Congress in 1974 that would have prohibited employment discrimination on the basis of sexual orientation by adding it as a protected category to the 1964 Civil Rights Act. That bill never received so much as a committee hearing. Gradually whittled down from a sweeping proposal revising civil rights law to a narrow bill solely addressing employment discrimination, the Employment Nondiscrimination Act (ENDA) failed to pass the United States Senate by one vote in September 1996. Since 1982, twelve states plus the District of Columbia have passed laws prohibiting discrimination on the basis of sexual orientation; two states, Minnesota and Rhode Island, as well as the District of Columbia, also prohibit discrimination based on gender identity. In addition, over 200 local polities also prohibit discrimination based on sexual orientation.

Marriage

The Senate vote on ENDA resulted from a political compromise that grew out of another major issue, same-sex marriage. The first known instance of a same-sex couple attempting to wed legally involved a gay male couple in Minneapolis in 1970. This and other isolated efforts during the 1970s met with quick dismissal by state courts. During the 1970s and 1980s, many leaders of the growing LGBT civil rights movement considered same-sex marriage a low priority. In part, they expected to lose any legal challenges on the issue, creating only a string of bad precedents. In part, feminist activists considered marriage an inherently sexist institution that lesbians and gay men should eschew as part of their drive to eliminate heterosexism.

Movement leaders lost control of the issue in 1993 when two women in Hawaii challenged the state's refusal to grant them a marriage license with the case *Baehr v. Lewin*. Surprisingly, the state supreme court found a violation of the state constitution's guarantee of equal protection on the basis of gender—if the state allowed a woman to marry a man, then it could only prohibit her from marrying a woman if it could show some compelling interest in doing so. The supreme court remanded the case to the trial court to adjudicate the question of the state's interest in prohibiting same-sex marriage. The trial court found no compelling interest, thus paving the way for same-sex marriage in Hawaii, but in 1998 the state legislature put before the voters a constitutional amendment reinstating the prohibition. It passed easily. Voters amended the Alaska state constitution to overturn a similar state supreme court decision there.

Beginning in 1996, conservative activists provided members of every state legislature with model language for laws to prohibit the recognition of same-sex marriages in their state even if another state began to permit them (until then, all states automatically recognized marriages performed in other states). They also introduced the Defense of Marriage Act (DOMA)

in Congress. DOMA restricts marriage for purposes of federal law to the union of one man and one woman, prohibits same-sex couples from receiving federal benefits that opposite-sex couples enjoy, and declares that states may refuse to recognize same-sex marriages performed in other states.

DOMA also had the advantage for conservatives of forcing President Bill Clinton, the nation's most openly pro-LGBT president to date, to sign an anti-LGBT law during an election year. LGBT activists asked Democratic leaders in the Senate to offer ENDA as an amendment to DOMA, which would have put conservatives in the difficult position of having to vote for employment protections if they wanted to vote against same-sex marriage. Instead, the Republican Senate leadership agreed to hold floor debate and a vote on ENDA in return for the Democrats' decision not to amend DOMA with it.

In December 1999, the Vermont state supreme court issued a unanimous ruling finding that the denial of marriage licenses to same-sex couples violated the state's "common benefits" clause, which is broadly analogous to the equal protection clause of the United States Constitution. However, rather than instruct the state to begin issuing marriage licenses to same-sex couples, the court told the state legislature to ensure the same rights under state law for same-sex as for opposite-sex married couples. The legislature had the option of simply permitting same-sex marriage, but instead created a new category of "civil unions." In June 2002, national and state activists filed suit in New Jersey on behalf of seven same-sex couples who demanded that the state allow them to marry. In 2003 and 2004, the Massachusetts courts ruled that same-sex couples had the right to marry. This decision spurred many same-sex couples to plan marriages in that state. In February 2004, despite opposition from Governor Arnold Schwarzenegger, over 3,000 lesbian and gay couples in San Francisco exchanged vows with the support of that city's mayor. Religious and social conservatives have, in turn, pressed the federal government to pass a constitutional amendment to ban same-sex marriages. Many states have also passed laws against same-sex marriage. Polling data conducted in 2004 show large majorities of Americans to be opposed to same-sex marriage. Thus, the issue remains far from resolved on a state and federal level.

Military Service

Military service has played a key role in the development of the LGBT civil rights movement since World War II. The war itself contributed to the emergence of the movement in at least two ways. First, it placed large numbers of young men and women in sex-segregated environments away from home, whether in the armed service or in war-related industries. Second, it created a large cohort of men and women who suffered dishonorable discharges from the military for same-sex sexual activity. A significant number of such veterans saw their discharges as unjust and went on to contribute to the LGBT civil rights movement.

Only in 1975, however, would LGBT activists explicitly take up the issue of the military's ban on openly LGBT service members. That year, the air force began discharge proceedings against Technical Sergeant Leonard Matlovich, who had deliberately revealed his gay identity to his superiors after deciding that he would remain a hypocrite so long as he claimed to fight for freedom and equality in an institution that would discriminate on the basis of sexual orientation. The Uniform Code of Military Justice had long had provisions prohibiting sodomy. The policy that aimed at LGBT identity, as opposed to particular sex acts, resulted in the early 1940s from the increased influence of psychiatrists and the psychiatric evaluation of LGBT identity as mental illness, plus the huge demand for person power, as the nation prepared for World War II. The new policy allowed military leaders to discharge LGBT service members without relying on the relatively cumbersome process of court martial under the sodomy prohibition. Before 1975, of the thousands of service members who suffered discharges, only a few challenged their discharges, and most who did so relied on procedural arguments rather than disputing the substance of the policy. The military's handling of lesbian and gay soldiers vividly illustrated the connections between heterosexism and sexism as women suffered a much higher rate of discharge than men and male service members used rumors and accusations of lesbian identity to harass female service members.

Matlovich's was the most famous of a rash of challenges to the ban beginning in 1975. He appeared on the cover of *Time* magazine and spoke at every opportunity on LGBT civil rights. As a Republican who had served three tours of duty in Vietnam, earning numerous medals and commendations in the process, Matlovich defied stereotypes about gay men.

After 1980, the issue largely disappeared from the view of both the general public and most LGBT persons. It reemerged in 1992 when Democratic presidential nominee Bill Clinton promised to lift the ban

on LGBT soldiers if elected. The issue became a major political debacle for President Clinton when Republican Senate minority leader Bob Dole raised the issue days after Clinton's inauguration. Conservative activists rallied, producing a deluge of calls and letters to Congress in support of the ban while the LGBT movement suffered from disarrayed leadership and the widespread failure of the rank and file to contact their elected officials. The result in July 1993 was legislation creating the "Don't Ask, Don't Tell, Don't Harass, Don't Pursue" policy. On paper, this policy meant that LGBT service members could continue to serve as long as they remained silent about their identities. In practice, as the new organization Servicemembers Legal Defense Network (SLDN) has documented, discharges of LGBT service members have steadily increased since 1993.

Finally, even as he continued to defend the "Don't Ask, Don't Tell" policy against repeated criticisms, President Clinton added a hate crimes provision to military law, providing increased penalties for crimes in which hatred for the victim's race, ethnicity, religion, sex, or sexual orientation motivated the perpetrator. He did so in 1999 after Barry Winchell, a soldier at Fort Campbell Army Base in Kentucky, died from wounds he suffered when a fellow soldier bludgeoned him with a baseball bat as he slept. The night before, Winchell, who was known to be dating a transgender performer at a Nashville gay bar, had beaten his attacker in a fist fight, leading the attacker to vow revenge.

Lesbian, Gay, Bisexual, and Transgender Movement

1870s–1920s

Lesbian, gay, bisexual, and transgender (LGBT) persons resisted oppression between 1870 and 1920. They occupied readily identifiable spaces in major American cities, earning for those cities a reputation as they had in Europe as hotbeds of perversion. They responded to authorities' increasing efforts at confinement and suppression by concealing themselves in some cases, but by defying the authorities in others.

Defining Homosexuals

Insofar as the term *social movement* denotes individuals organized to achieve social, cultural, and political change on their own behalf, persons in the United States who suffered discrimination on the basis of their gender identity and/or sexual practices did not qualify until after World War II. But 1870 remains a significant year for what would become the lesbian/gay/bisexual/transgender civil rights movement. As of that year, in French philosopher Michel Foucault's terms, "the homosexual was now a species." He meant that defining persons in terms of their gender of sexual object choice was a new idea, one that had as much to do with power relationships as it did with sex. Foucault's characterization has produced vigorous dissent, with scholars from various disciplines insisting that we can sensibly speak of "homosexual," "lesbian," or "gay" individuals and cultures throughout Europe, if not the rest of the world, at least since the Ancient Greeks.

Regardless of one's position on this academic question, it is clear that few social movements have focused so intently on the question of how to define their participants and on struggles between movement activists and various types of experts over those definitions. One of the landmark events in the history of LGBT activism illustrates the point: the decision of the American Psychiatric Association in 1973 to remove "homosexuality" as a mental illness from its official list of disorders, resulting from changes within the profession but also from protest by lesbian/gay social movement activists. Although LGBT activists in the post–World War II period may not have realized it, their debates necessarily revolved around categories and definitions that had changed dramatically and become the explicit focus of intellectual, social, and political contest since the second half of the nineteenth century.

Foucault chose 1870 as the date when "the homosexual" became "a species" because in that year the German researcher Karl Westphal published an article in *Archiv fur Neurologie* describing "contrary sexual feeling." Subsequent scholars usually give 1869 as the key date because Westphal also published a major article on the subject that year. Reflecting the simple fact that the United States during the late nineteenth century remained something of an intellectual backwater compared to Western Europe, the major debates about definitions of and terminology for what would become "homosexuality" initially occurred among German and English authorities.

Such debates gradually came to have a significant impact on American society, especially after 1900. On one hand, as scholars such as Blanche Wiesen Cook have insisted, the large cohort of never-married women who led many of the major reform activities associated with the Gilded Age and Progressive Era must have included many whom we would now call "lesbians." On the other hand, considerable evidence indicates two things: first, that the profuse declarations of love and commitment characteristic of ardent "romantic friendships" between persons of the same sex during the nineteenth century did not necessarily indicate that the friends also had sex with each other; and second, that individuals who did engage in same-sex sexual activity did not necessarily organize their identities and lives around such activity in the manner that we now expect from lesbians and gay men.

That is, sexologists and psychiatrists of the late

nineteenth century created the category "homosexual." Police and medical authorities used it as a reason for arrest, treatment, and other forms of discrimination before World War II, but it did not enter most people's vocabularies until during and after the war, when it increasingly served not only as a reason for discrimination, but also as the basis of resistance by those who suffered such discrimination.

This is not to suggest the complete absence of lesbian and gay subcultures in the United States before World War II. Cities provided a combination of reliable employment and anonymity that allowed gay men especially, but also lesbians (including cases of women who successfully disguised themselves as men for extended periods), to organize their lives around same-sex relationships and activities. Among the most famous American expatriates in Paris during the early twentieth century were the lesbians Natalie Barney, Alice B. Toklas, and Gertrude Stein. But the simple dichotomy "homosexual/heterosexual" utterly fails to capture the complexity of same-sex activity and the range of identities, choices, and cultural forms that participants in such activity created for themselves.

Instead, that dichotomy served well during the late nineteenth and early twentieth centuries as an anchor for middle- and upper-class men who found their masculinity under siege from larger economic, social, and cultural changes. The growing number of men who made their livings as office workers in this period seemed to lack important characteristics of masculinity. This problem coincided with other disturbing phenomena: factories, stores, and offices provided new employment options for women; both male and female factory workers became increasingly militant; the largest wave of immigration in the nation's history brought families with many more children than those of native-born couples; and women suffrage activists challenged gender norms directly. What middle- and upper-class men seemed to be losing in terms of political and cultural authority they could possibly regain by explaining resistance to the prevailing order as a sign of disease. The sexologists, eugenicists, and psychiatrists who conducted research on sexual minorities, creating such categories as "homosexual," "invert," "pervert," and "heterosexual," saw themselves as dispassionate scientists who simply described the world around them. In retrospect, however, anxiety about apparently eroding distinctions of gender and sexuality, but also race and class, clearly motivated their work.

Combining Sexuality with Race, Class, and Gender

Researchers, European or American, between 1870 and 1930 typically condemned lesbian identity much more vigorously than gay male identity. They also found evidence of perversion and its deleterious effects much more widespread among the poor and racial and ethnic minorities. The displacement of political issues into supposedly dispassionate scientific research was perhaps most obvious in the growing tendency to denounce women's rights activists as pathological and describe their alleged betrayal of their sex as an indication of probable lesbian identity. The proposition that "homosexuality" was a disease led most European authorities to oppose criminal penalties for same-sex activity in favor of medical treatment. American doctors, by contrast, often saw criminal penalties as a necessary deterrent to a malady that they associated with the stresses of modernity, one that might therefore spread with the economic and social changes that comprised modernity. In 1917, public health experts consulted with Congress on the creation of psychiatric exclusion categories for an immigration law that had the effect of barring lesbian/gay aliens from entering the country. That prohibition would persist in varying forms until 1990.

Regardless of whether a given expert hoped to help sexual minorities, or protect the larger society from them, their efforts to taxonomize and study sexual and gender deviance created the widespread, deeply entrenched belief that lesbian, gay, bisexual, and transgender identities define the individuals who exhibit them as at least very different from "normal" and at most seriously ill. This belief in turn created the context in which the post–World War II LGBT civil rights movement would emerge. It spread through American culture only gradually, however. In 1870, a man who had sex with other men, even on a regular basis, could maintain his status as "normal" as long as his general deportment and his role in sexual activities remained properly masculine. Middle-class men and women, quicker to absorb the values and beliefs of medical professionals, first came to think that one's sexual object choice could define one's identity in all areas.

Sexuality and the Emergence of Queer Culture

If "normal" men who had sex with other men remained largely below the radar of sexologists and reformers between 1870 and 1920, "pansies," "dykes,"

and other, more obvious gender and sexual outlaws were highly visible, especially in major cities, demonstrating the limits of conceptual and political control by experts and authorities over the sexual practices and identities of ordinary people. Men had a wide range of options for same-sex sexual expression that involved degrees of gender nonconformity, from masculine "trade" who might lead otherwise ordinary lives as married men but step out for some man sex on occasion, through otherwise unremarkable gay men who remained unmarried but mostly invisible as gay men, to highly visible "fairies" who deliberately flaunted their sexual identities by wearing makeup and women's clothes and congregating in those public establishments that would have them. Even so, where control in the form of taxonomies alone failed, routine police repression remained an important tool for maintaining the boundaries of gender and sexuality.

The sole known effort at gay rights organizing before World War II illustrates how sexual minority identity could make outlaws of individuals. In 1924, Henry Gerber became secretary of a new homosexual rights organization in Chicago, the Society for Human Rights. In 1925, he suffered arrest and several hearings for distributing an allegedly obscene publication, *Friendship and Freedom.* Although a judge eventually dismissed the charges and reprimanded the police for invading Gerber's apartment and arresting him without a warrant, he had already spent several nights in jail and he never recovered all of his property.

Gerber's experience notwithstanding, the 1920s saw a marked upsurge of overtly queer culture, especially in New York City. However, with the beginning of the 1930s and the Great Depression, officials cracked down on the drag performances and balls that had been common since 1870. Paradoxically, Prohibition had the effect of increasing the visibility of gender and sexual nonconformity as the widespread corruption of the period reduced respect for law and order generally. The end of Prohibition, and the beginning of the Great Depression, brought renewed concern for order and for limits on gender and sexual deviance. Whatever their daily visibility and defiance during the late nineteenth and early twentieth centuries, LGBT persons remained susceptible to the whims of elected officials and police until well after World War II.

Lesbian, Gay, Bisexual, and Transgender Movement

1920s–1969

Although the American gay and lesbian political and social movement developed dramatically in the last third of the twentieth century, its origins lay in the cultural and political shifts of an earlier period. The middle third of the century was marked by two vital developments. First, homosexually active men and women were increasingly labeled and understood as possessing a particular identity. That labeling was often done by medical professionals and legislators who sought to treat or punish them, but ironically, homosexually active men and women also began to understand themselves differently as a result. Second, as part of that new self-understanding, homosexuals began to conceive of and act on the communal and political implications of that identity; they began to see themselves as a potential social and political constituency.

Historians have maintained that the notion of "a homosexual"—that is, of a person defined solely by a consistent sexual desire for individuals of the same physical sex—came into existence only in the latter half of the nineteenth century and required several decades to take root in American popular culture. Although particular sexual activities might have warranted labels at that time, those labels did not identify individual people. Even in the first decades of the twentieth century in New York City, participants in male same-sex activity were more defined by their gendered behavior than the sex of their sexual partners. Thus, many of the men who frequented the bars or bathhouses where they could meet and have sex with other men were understood as "normal" because they maintained a masculine demeanor and style. Only the "fairies" or "pansies"—men who not only sought out sex with men, but who behaved or dressed according to feminine gender rules—were perceived as possessing a fundamentally different identity. Sexual activity was not widely conceived as the foundation for an identity, and therefore there was only a very narrow basis for establishing a strong social movement. Unlike African Americans and women, homosexually active men and women in the United States first had to understand themselves as sharing a social identity in order to begin to organize for change.

Importantly by contrast, in these same early decades an identity-based rights movement had firmly taken hold in Germany; indeed, that movement inspired the first spark of an organized American movement to flare briefly in Chicago in 1924. Henry Gerber, a German émigré, served with the American occupying army in Germany from 1920 to 1923 and became inspired by the movement he discovered there. Upon his return, he teamed up with a handful of other men interested in same-sex liaisons to form the Chicago Society for Human Rights (SHR). The group even received a state charter, specifying its goals of aiding those who are "abused and hindered in the legal pursuit of happiness which is guaranteed them by the Declaration of Independence, and to combat the public prejudices against them by dissemination of facts according to modern science." Gerber found, however, that homosexually active Americans in the 1920s proved difficult to politicize. "One of our greatest handicaps," he later wrote, "was the knowledge that homosexuals don't organize. Being thoroughly cowed, they seldom get together." SHR was quickly squashed when one member's wife turned him into the police, who arrested two others, including Gerber.

The American focus on gender seemed at its peak at the start of the Great Depression. In cities like New York, Chicago, and Los Angeles, in the early to mid-1930s, nightclubs boasted what historian George Chauncey has deemed a "pansy craze," with gender-flaunting men serving as celebrated hosts and star performers. As the Depression extended, however, throwing countless breadwinning husbands and fa-

thers into unemployment, there was fairly widespread anxiety about national gender roles. Women were urged to give up their jobs and men were told to stiffen their masculine resolve. In this context, pansies were deemed abhorrent, and a crackdown moved from city to city: police squads closed clubs, arresting proprietors and performers, and celebrity careers ended. Significantly, more and more police departments moved not only against pansies, but also against gender-conforming men who had sex with other men. Indeed, in some states, the new post-Prohibition power to regulate and license bars was used to shut down those watering holes where men and some women went to meet people of the same sex. These policing actions marked a transition toward a social system that tied personal to sexual activities.

Sexuality and World War II

During World War II and its concomitant military service, this oppressive labeling and persecution increased. During the war, psychiatrists convinced the federal government of their ability to help develop a combat-ready military by screening out the emotionally unstable from the recruits. As a result, millions of young men were asked if they had homosexual feelings, if they liked girls, if they had sex with men, or, as *Time* magazine reported, simply, "How do you get along with girls?" (Eventually, similar standards were developed for screening women.) Despite the failure of these questions to yield honest answers—of the millions of inductees, only 4,000 or 5,000 were rejected for homosexuality discovered during their screening—their widespread application and the conversations they provoked began to solidify a notion of homosexual identity for a generation of Americans. Ironically, for those soldiers who lied about their desires and were discovered, their prosecution or hospitalization and eventual dishonorable discharge only served to further codify this growing sense of a particular social identity.

Beyond the oppression, however, military service also uprooted millions of young Americans and placed them into camps and units together. Thousands of men and women not only uncovered their own desires in the same-sex world of the military, but simply because of the numbers of soldiers, many of them found one another there; they found others like themselves. This was a significant watershed; as historian Allan Bérubé has written, "Gathered together in military camps, they often came to terms with their sexual desires, fell in love, made friends with other gay people, and began to name and talk about who they were." Both because of assignment and self-selection, certain military positions—male typists or nurses, female drivers—became dominated by homosexually identified men and women. Others found refuge in the all-male performance troupes that put on shows wherever GIs set up camp. Thus, there developed pockets in the military where a sense of shared identity could take hold.

This experience of group discovery also permeated the many port cities like Los Angeles, San Francisco, Seattle, and New York that were centers of the military mobilization. These cities developed a rich social scene with bars and parties that catered to some degree to homosexually active men and women—often mixed up with or close to the other military-friendly bars. Those urban social worlds were similarly significant gathering points and sites of self-discovery for the curious men and women of small-town America headed off for service, and many of them chose to make these large cities their new homes when they were discharged from duty. Thus, much as World War II served to urbanize a wide swath of African Americans, drawing them into the nation's cities to participate in the military buildup, it equally served to gather a generation of homosexuals, both placing them within the same-sex world of military service and near to the sexual demimonde of the nation's major metropolises.

This nationwide process of oppressive identification and group discovery showed some impact in the 1940s. In Los Angeles, in 1947, for instance, a young woman who had only recently discovered the lesbian bars of the city began writing and circulating a newsletter "for gay gals" called *Vice Versa* that included book and movie reviews, essays, and poetry. And veterans throughout the country stayed in contact with one another after the war, creating networks of support for themselves and for others. Although these activities represented an expansion of the social arena of same-sex activity beyond bars and parties and cruising, an additional influence was required to shift these social and cultural activities toward a more coherent political movement. That influence came from the Communists and leftists of Los Angeles.

In the late 1940s, Los Angeles leftists, among other things, were very involved in fighting racial injustice in the city. Just as the war had brought thousands of African Americans into the cities, it also sparked heated racial violence and left lingering antipathy against blacks, Mexican Americans, Japanese Americans, and Jews. The Communist Party had long

HENRY "HARRY" HAY JR.

(1912–2002)

Henry "Harry" Hay Jr. helped found the American homosexual rights movement in the 1950s and fought steadily for his vision of the unique role homosexuals could play in society. Born in England in 1912, Hay moved to Los Angeles with his family in 1919. After college, he became active in LA's overlapping worlds of theater and leftist politics. Introduced to the Communist Party by a long-term lover, actor Will Geer, Hay became increasingly political: he moved from labor protests and agitprop theater to campaigning for the recall of the mayor, developing a repertoire of "people's" songs for activists, and teaching Party courses in political economy, music history, and revolution. He also decided to marry another Party member.

Nevertheless, Hay's homosexual activities continued, and, in 1948, inspired by a discussion of presidential politics and fearful of the McCarthyite tendencies of the federal government, Hay wrote a proposal for an organization to aid and protect homosexually active men. In Hay's vision, the group, with the elaborate name of the International Bachelors' Fraternal Order for Peace and Social Dignity, would strive to secure "socially, economically, politically, and morally, the integration of the best interests of the Androgynous minority with the common good of the community in which we live." It took two years before Hay's proposal found any supporters, and then the renamed Mattachine Foundation began. Hay separated himself from the Party and his family and threw himself into Mattachine.

Those initial Mattachine meetings were a time of profound and challenging discovery as the participants, lacking a shared vocabulary, tried to analyze their lives and relationships. To Hay, the discussion sessions were thrilling: from them, "we get this sense of a brotherhood, we get this sense of a belonging, this sense of a being together." Hay's excitement over Mattachine's success, however, was mirrored by his depression when his leadership, structure, and goals were soundly rejected in 1953 and he came close to suicide.

After being called before the House Un-American Activities Committee in 1955, Hay spent several somewhat melancholy years investigating the cultural history of homosexuals and participating in ONE seminars. In 1963, however, Hay found a life partner in John Burnside, and together they initiated business and activist ventures. By the late 1960s, they had rejoined other homophiles to establish the North American Conference of Homophile Organizations, worked in the American Indian Movement, and helped launched the Los Angeles Gay Liberation Front.

During the 1970s, Hay and Burnside settled in New Mexico where Hay deepened his studies of *berdache,* or third-gender individuals, in Native American communities. By decade's end, back in Los Angeles Hay became instrumental in developing a new, spiritually focused, gay liberation group, the Radical Faeries. Hay had long maintained that gay people had a particular consciousness and style of social relations, both of which placed them in a unique role in preserving social balance. The Faeries, using consensus, ritual, and celebration, became an invitation to embrace that uniqueness, to "throw off the ugly green frogskin of hetero-imitation to find the shining Faerie prince beneath." Having suffered from lung cancer, Hay died October 24, 2002.

Gerard Sullivan

fought against racial divisiveness and had developed a language, shared by other progressive activists, for articulating the position and plight of oppressed social minorities. Indeed, through organizations like the Civil Rights Congress, the progressive and far left waged fights against racial violence, restrictive housing covenants, and police brutality. In the late 1940s, Harry Hay, a Communist Party member and instructor, borrowed the language and style of the Party to envisage an organization that, with a similar secret cell structure, would take up the cause of an unprotected social minority, what he deemed the "androgynous" or homosexual minority. In 1950, a handful of men, many of them former leftist activists themselves, determined to join Hay in starting such an organization. They called it the Mattachine Foundation (the group takes its name from *les Mattachines*, groups of unmarried men that performed dances during the French renaissance that Hay had discovered in his studies), and with their group was born the Homophile Movement, the first phase of the long-lasting movement for gay and lesbian rights.

THE HOMOPHILE MOVEMENT 1950s

Initially, the Mattachine Foundation consisted of half a dozen men who set in motion a project of identity

Shortly before his death in 2002, gay rights pioneer Harry Hay (left) sits beside his life partner John Burnside at their home in San Francisco. *(AP Wide World Photos)*

development: trying to figure out what being homosexual meant, not as defined by psychiatry or criminal laws, but by the men and women who lived it. They identified three goals for themselves: constructing a sense of community, in part through self-education; teaching the larger society to relinquish their prejudices; and mobilizing public action. Their principal tactic—and a strategy that remained prominent within Mattachine and the homophile movement long after the founders had departed—was regular discussion sessions. These sessions, similar to some of the organizing meetings of the Communist Party as well as the consciousness-raising meetings used later in the black civil rights and women's movements, initially involved only the founders; as the organization grew and participation spread, discussion meetings were lead by one of the founders but in a variety of people's homes. These discussions turned on questions as varied as how to handle arrest, why homosexual marriages seemed to fail, and whether there was truly a homosexual culture. They largely constituted an effort to swap stories and discover not simply shared sexual desires but shared experience, the cornerstone for a shared sense of identity. In addition, Mattachine organized more public meetings as a kind of recruitment tool, drawing a wider crowd to a lecture from some (often critical) expert speaking about homosexuality or a general discussion of the 1948 Alfred Kinsey study of male sexuality. By late 1952, between 50 and 100 groups were meeting regularly around Southern California, with a handful of other groups starting in northern California; some 2,000 to 5,000 Californians participated in Mattachine activities. Over the next twenty years, the organization changed shape, direction, and central location but remained a vital force in homosexual activism.

As Mattachine grew, its more radical founders, and especially Harry Hay, pushed for it to take more public action. They sent questionnaires to local office-seekers, asking their views on antihomosexual poli-

cies. They organized a successful legal challenge to the entrapment and arrest of Dale Jennings, an early member, by a Los Angeles police officer who had in fact attempted to seduce him. They even joined a left-leaning chorus of protests over the violent arrest of several young Mexican Americans, claiming that the violation of one minority group's rights clearly threatened the rights of every other minority. In Hay's eyes, these actions constituted a central piece of laying claim to the oppressed minority identity that he believed homosexuals shared with Mexican Americans, blacks, and Jews.

When a Los Angeles columnist caught wind of the election questionnaire, however, and began investigating the organization and writing about it, a large portion of the membership voiced their disagreement with Hay's views. Many members were also provoked by the secrecy surrounding Mattachine's own leaders, who used false names or hid behind the names of individuals (such as Hay's mother) who were not truly involved in the organization. In 1953, at a constitutional convention rife with fears about Communist control and threats to turn over the membership rolls to the Federal Bureau of Investigation (FBI), an anxious and vocal majority ousted Hay and his cofounders, rejecting both his view of homosexuals as a distinct minority group and their efforts at public action. According to historian John D'Emilio, the leadership change marked a sorrowful abandonment of the sense of collective identity and action, as "accommodation to social norms replaced the affirmation of a distinctive gay identity."

While Hay and others drifted away from organized activities, a handful of the early members and others, including Don Slater, Jim Kepner, Dale Jennings, and Ann Carll Reid, coalesced around *ONE*, a magazine that a group of Mattachine members had just started to provide a forum for discussing their efforts. After the constitutional convention, *ONE* magazine did carry on some of the early Mattachine's more radical goals. Building up a subscriber base of some 2,000 (though the readership was likely much larger), the staff not only indignantly publicized news from around the country about police harassment, but also published essays and letters criticizing the legal and medical treatment of homosexuals and debating various aspects of homosexual identity. A letter writer to *ONE* felt comfortable, for instance, decrying the impulse to "excommunicate any homosexual who belies the . . . thesis that we aren't different." And another used the pages to insist, "If we must have a crusade it must be for civil rights and equality." In one of the first cases that brought the gay rights movement into the legal arena, *ONE* was seized by the Los Angeles postmaster in the fall of 1954 for being "obscene, lewd, lascivious and filthy." *ONE* fought the case clear to the U.S. Supreme Court where, more than three years later, the group was vindicated and homophile publications became safe items to send through the mail. That ruling broadened the avenues of communication necessary for sustaining a movement.

In addition, the *ONE* staff began to offer an educational program, seminars and courses, within what became the ONE Institute of Homophile Studies. These classes, in many ways, set out to cultivate and substantiate the ideal of a homosexual culture and community that had motivated Hay and his supporters. Beginning in 1955, ONE started offering a "Midwinter Institute," a day or two of paper presentations and roundtable discussions. By the end of the 1950s, however, ONE was offering semester-long courses on homosexuality in history, the sociology of homosexuality, and homosexuality in literature.

Meanwhile, the new Mattachine leadership slowly shifted the center of operations up to San Francisco. Under the direction of Hal Call and Donald Lucas, the organization, renamed the Mattachine Society, focused on public outreach and social services. Their first outreach efforts entailed publishing the *Mattachine Review* in 1955, which offered news of the organization, more general news, and prose accounts of homosexual life; though it was much less confrontational in its tone than *ONE*, people around the country discovered Mattachine by receiving a copy of the review from a friend. From the newsletter, Call and Lucas also ventured into general publishing, both printing books about homosexuality and helping distribute books from other presses. At the same time, Mattachine began to offer legal, emotional, and employment assistance to local San Franciscans and others who contacted them from farther away. In part, volunteers simply offered sympathetic ears and the wisdom of their own experiences. In situations that exceeded their expertise, however, Mattachine members began referring local clients to doctors, psychiatrists, and even employment agencies whom they had screened as supporting the goals of sexual equality. Indeed, Mattachine cultivated relationships with professionals, often inviting those who were critical of homosexuals to address Mattachine meetings. Such lectures, though criticized by later activists and scholars, were seen as providing at least some kind of discussion of homosexuality, and also served to forge ties

DEL MARTIN (1925–) AND PHYLLIS LYON (1928–)

Del Martin and Phyllis Lyon founded the Daughters of Bilitis (DOB) in their San Francisco apartment in 1955 with six other women, and while the other women drifted away, Martin and Lyon became the group's emotional and administrative core. They edited and wrote much of its monthly magazine, hosted hundreds of meetings, and donated their own money to keep it going.

Martin, born in San Francisco in 1925, married, had a child, and divorced before she began exploring the lesbian worlds of first that city and then Seattle. Lyon, born in 1928 in Tulsa, Oklahoma, eventually moved to Seattle and went to work at a publishing company where she met Martin. The two became friends, then lovers, and then moved back to San Francisco together in 1953. While they tentatively and unhappily explored the bar scene, they jumped at an invitation to form a lesbian social club with three other couples and thus began DOB. Martin and Lyon, inspired by their exposure to the Mattachine Society, strove to make the group an advocate for changing public attitudes about lesbians and began to host similar public lectures and discussions. As they explained, "It wasn't until [much later] that we realized we knew a whole lot more about homosexuality than Joe Psychiatrist and Joe Lawyer. Back then we didn't know. . . . We needed support from the establishment." At the same time, Martin and Lyon were sensitive to the importance of creating a separate refuge where lesbians could feel safe, and incorporated self-help elements into the DOB program. Within the context of the male-dominated homophile movement, they fought for recognition of the separate needs of homosexual women.

By the mid-1960s, while DOB remained focused on assisting women and providing social support, Martin and Lyon became more radical in their concerns. Lyon, who had served as the editor of *The Ladder* for several years, had already broken a taboo by using her real name on the masthead. During 1964, the couple participated in a series of discussions between gay men and lesbians, and Christian ministers, which yielded "unexpected avenues of communication and cooperation between the two groups," according to Martin, and led to the creation of the Council on Religion and the Homosexual (CRH). When a CRH-sponsored New Year's dance was raided by the police, the ministers, joined by the American Civil Liberties Union, responded with publicized outrage that gave new legitimacy to complaints of homosexual harassment.

During the 1970s, the women began focusing their efforts explicitly on women's lives. In 1972, their co-written *Lesbian/Woman* was published, a combination autobiography and account of the diversity of lesbian experiences, from self-discovery to living together to parenting. Five years later, Martin published a seminal study of domestic violence, *Battered Wives*, in which she criticized marriage as an institution and called for criminal laws focused specifically on spousal abuse. In 1979, they helped establish a women's health clinic, which now bears their names. Most recently, the couple has been advocating for Social Security and Medicare reforms, and, in 1995, both served as delegates to the White House Conference on Aging.

Gerard Sullivan

with experts who might help society accept the homosexuals in their midst.

In 1955, the efforts of ONE and Mattachine were supplemented by the Daughters of Bilitis (DOB), an organization founded that year by Del Martin, Phyllis Lyon, and six other women determined to provide a social alternative to bars for middle-class lesbians. (According to some founders, Bilitis was a contemporary of the Greek lesbian poet Sappho.) Although the other women dropped out of the organization, Martin and Lyon devoted themselves to sustaining it financially, spiritually, and intellectually. They also helped push the group beyond social activities toward shaping the public perception of lesbians, in many ways following the model of Mattachine. An important DOB goal was to provide communal support for women struggling with their identities, and they used their monthly magazine, *The Ladder*, not so much to rouse political attitudes as to reach isolated women with bits of poetry, biography, and fiction. Like Mattachine, however, DOB also sought to encourage lesbians themselves to behave in a manner more acceptable to society. One early issue of *The Ladder*, for instance, carried the message from the president that "our organization has already converted a few to remembering that they are women first and a butch or fem secondly. . . . There is a place for them in society, but only if they wish to make it so."

BARBARA GITTINGS (1932–)

Barbara Gittings played a vital role in pushing the homophile movement, and especially homophile women, toward a more radical activism and vision. Born in Vienna, Austria, in 1932, Gittings grew up in Wilmington, Delaware. While attending Northwestern University, she tried to put a "homosexual label on myself and tried to come to terms with what it meant to be gay." Searching for information, she devoured novels as well as psychology and legal texts; she also stopped doing her course work and flunked out. Eventually settling in Philadelphia, she discovered bar life and then, through a friend, encountered ONE, Mattachine, and the Daughters of Bilitis (DOB). In San Francisco in 1958, Del Martin and Phyllis Lyon asked Gittings to help start a New York DOB chapter, the organization's first East Coast chapter. She accepted the challenge and became its president.

Gittings was soon a regular weekend commuter between New York and Philadelphia, organizing social events and lectures, and successfully launching the new organization. More administrator than leader, Gittings nevertheless built up a mailing list of over 300 and issued a regular newsletter. But under the influence of her partner, Kay Tobin Lahusen, as well as Frank Kameny and Randy Wicker, Gittings moved toward making more radical demands of the national DOB and the wider movement. From late 1962 to 1966, Gittings used her position as editor of *The Ladder*, the national DOB magazine, to challenge the conservative leadership, who opposed tactics like public picketing and believed homosexuals should rely on experts to convince the public to accept them. She also increased the visibility of the magazine by subtitling it "A Lesbian Review," and placing photographs of real lesbians on the magazine's cover instead of artwork by readers. By 1966, however, Gittings grew too frustrated with DOB and left to join other groups.

As gay political action became steadily more radical, Gittings and Lahusen moved with it. Regular fixtures of the late-1960s pickets in Philadelphia and Washington, D.C., they soon joined the Gay Liberation Front and then the Gay Activists Alliance, which Lahusen helped found. Gittings, who by 1970 was doing a weekly fifteen-minute gay radio show in New York, also began working with a gay group within the American Library Association to promote gay literature and develop a "Gay Bibliography" for librarians to use in ordering books. Gittings, who led the task force for fifteen years, wanted to ensure that gay teens would have easy access to their history and culture in a way she had not. In addition, she became very active in the campaign to press the American Psychiatric Association to remove homosexuality from its list of illnesses. She coordinated discussion panels at American Psychiatrist Association national conferences and even hosted booths there entitled "Homophobia: Time for a Cure" and "Gay Love Is Good Medicine"; by 1973, the campaign succeeded. Gittings also helped to start the National Gay and Lesbian Task Force, and the Gay Rights National Lobby, a D.C.-based lobbying group and a forerunner of the Human Rights Campaign.

Gerard Sullivan

It is important to recognize that homosexual life was hardly exclusive to organization meetings. The vast majority of homosexual gathering occurred in bars. And while there was often a contentious relationship between bar patrons and homophile activists, it would be wrong to view bar life as apolitical. Certainly, the founders of DOB created the organization out of a desire to have an alternative to the bar scene and often viewed it with disdain. At the same time, activists seeking new recruits could be treated with equal contempt by bar regulars. Nevertheless, not only did homophile groups often assist clients in finding bars and coping with the harassment they experienced there, but bar attendance constituted its own kind of political activism. As scholars like Elizabeth Kennedy and Madeline Davis have argued, because of the regular and legal police harassment of bar patrons, participation in the gay nightlife represented its own act of resistance. The consequences of claiming a piece of public social space for bar habitués could be beatings, arrest, public notoriety, and the collapse of family relations and social status. The risks were even greater for the butches of the lesbian world, dressed and styled in male-gendered fashion, or the men who adopted female gender styles; they challenged the legal and cultural codes from the moment they left their homes. By inspiring these daily acts of resistance, then, the gay and lesbian social world proved a critical crucible for cultivating radicalism.

By the start of the 1960s, however, as an organized movement, the homophiles remained weak and troubled. Although Mattachine and DOB chapters had spread from California to New York, Philadelphia, Chicago, and Detroit, active members for Mattachine

numbered 230 and half that for DOB. While the San Francisco Mattachine found experts to aid their clients and the Los Angeles chapter began to work with Evelyn Hooker, a psychologist whose research undermined the notion of homosexuality as an illness, most chapters continued to host lectures and publish essays by professionals who took just the opposite stand. As New York DOB president Barbara Gittings later explained, "Just to be mentioned, no matter what they said, was important at first. It broke the taboo of silence about homosexuality." In San Francisco, a 1959 mayoral election featured widely publicized allegations that because of Mattachine the city had become a magnet for homosexuals—charges that briefly yielded greater leniency toward the homophiles. By contrast, however, a Denver Mattachine convention that same year led to raids of local leaders' homes and arrests. And dissent among homophiles themselves so divided the movement that by 1961 DOB and ONE were barely in contact, and Mattachine dissolved itself as a national organization, leaving each local chapter to determine its own course.

THE HOMOPHILE RESURGENCE 1960s

In the early 1960s, a mix of new and old leaders injected the homophile organizations with a new activist impulse, compelled both by their own desires for change and by the wider culture of activism that was working its way across the country. In 1961, Franklin Kameny and Jack Nichols formed a Mattachine chapter in Washington, D.C., that became the avant garde of homophile activism. Kameny, a Harvard Ph.D. who had been fired by the federal government when his homosexuality was discovered, had a firm belief in the rights he had been denied and in using the political system to correct the government's flaws. Having challenged his own dismissal to the U.S. Supreme Court, he similarly urged homophile activists to lay claim to their rights. At the same time, he had little regard for the experts to whom his homophile colleagues were so deferential. Rejecting the notion that homophiles should provide a forum for debating the immorality or illness of homosexuality, Kameny insisted that they instead lay claim to their rights as moral adult citizens. He called on the D.C. chapter to be "an activist militant organization," which, as he later recalled, "were very dirty words in the movement." The Washington chapter met steadily with federal officials, demanding they change their discriminatory hiring practices, and won the support of the local American Civil Liberties Union (ACLU). The local ACLU both successfully challenged the case of a rejected job applicant and convinced the national ACLU to begin to consider the injustice of antihomosexual discrimination.

Demanding dignity, freedom, and an end to discrimination against homosexuals, Barbara Gittings and other activists picket Independence Hall in Philadelphia on July 4, 1966. *(Kay Tobin Lahusen)*

The Washington group's activist attitudes were echoed by a handful of Mattachine and DOB members elsewhere, especially in New York. There Randy Wicker formed his own Homosexual League and waged a publicity campaign that yielded coverage by *Newsweek*, *Harper's,* and the *New York Times* on homosexual life and efforts by homosexuals to speak for themselves. Gittings, president of the New York DOB and editor of *The Ladder*, used the magazine to argue for more public actions and for faith in homosexuals as their own authorities. As she later explained, "By the 1960s, we began to see that discussing the cause and the nature of homosexuality would not help us. We began to insist on our rights, to spell them out clearly." By 1963, the organizations formed a loose co-

FRANKLIN KAMENY (1925–)

Franklin Kameny was one of the most determined fighters in the East Coast homophile movement, inspiring others by his willingness to challenge directly the discriminatory practices of the federal government. Born into a Jewish New York family in 1925, Kameny enlisted in the army at the age of eighteen and fought in Europe during World War II. Afterward, he earned a Ph.D. from Harvard and joined the U.S. Army Map Service. In late 1957, however, a civil service officer confronted Kameny with allegations of homosexuality—which Kameny neither confirmed nor denied—and arranged for his termination. (President Dwight Eisenhower had explicitly deemed "sexual perversion" as grounds for dismissal of federal employees.) Kameny then began a long battle, appealing through the civil service system, to Congress, and even requesting a hearing before the U.S. Supreme Court—deeming the federal policy a "stench in the nostrils of decent people"—but his requests were denied.

As a result, Kameny turned his energies to collective action. He contacted the New York Mattachine Society and, in the fall of 1961, founded a Washington chapter. Closely watched by the Federal Bureau of Investigation (FBI), the chapter became the radical cutting edge of the homophile movement, driven by Kameny's insistence that homosexuals demand their rights as citizens. In that spirit, the D.C. Mattachine placed J. Edgar Hoover on their mailing list, believing that if the FBI was helping African Americans in their civil rights struggle, they should do the same for homosexuals. The Washington chapter also met steadily with federal officials, insisting they change their discriminatory practices, and Kameny was vital in coordinating the pickets in front of the White House, Pentagon, State Department, and Civil Service Commission.

In addition, Kameny pushed the larger homophile movement to stop its long-standing practice of inviting "expert" lecturers who argued that homosexuality was a sickness or a perversion, simply because they spoke on the subject. "My answer to that was, '*Drivel!* We are the experts on ourselves!' " Kameny coined and promoted the phrase "Gay Is Good" to express his attitude, and in the early 1970s, he joined Daughters of Bilitis veteran Barbara Gittings in challenging the American Psychiatric Association to drop their designation of homosexuality as a mental illness; by 1973 they had succeeded.

Although Mattachine's leadership role declined following the Stonewall riots in New York City in 1968—and the Civil Service Commission finally (in 1975) dropped its policy excluding homosexuals from federal employment—Kameny has continued to be an outspoken activist. In 1971, he ran for Congress as the first openly gay candidate; in 1975, he was named to the D.C. Human Rights Commission; and in 1979, he joined the first contingent of gay leaders to be invited to the White House. As a veteran, Kameny has also fought for protection of gay servicemen and women, including challenging the 1990s "Don't Ask, Don't Tell" policy. The night that President Bill Clinton spoke at a Human Rights Campaign function in 1997, Kameny deemed the event "clear evidence of the astonishing success of the gay movement over the past four-and-a-half-decades."

Gerard Sullivan

alition, East Coast Homophile Organizations (ECHO), which also included a Philadelphia group and provided a network and forum for the more militant activists to communicate and strategize.

In April 1965, press reports of Cuban imprisonment of homosexuals inspired a handful of militants to picket the United Nations and the White House; by May, ECHO had scheduled a series of pickets including the Civil Service Commission, the Pentagon, and a Fourth of July protest at Philadelphia's Independence Hall. These were small, peaceful, and orderly demonstrations of men dressed in suits and women in dresses who, with carefully lettered signs, called on the federal government to stand by its principles. White House picketers' signs made direct claims like "Denial of Equality of Opportunity Is Immoral," and "Sexual Preference Is Irrelevant to Federal Employment." Nevertheless, one magazine insisted that the picketers were hired actors because, as Kameny explained, for "some people it was inconceivable that actual, real gay people would do such things publicly." At the same time, although the old guard in DOB forced Gittings out and reinforced their own authority, the militant activists gained control of the leadership of New York's Mattachine chapter.

Meanwhile, during the early 1960s in California, the daily politics of bar life and that of activist organizing began to converge. At the decade's start, in the wake of revelations of the San Francisco police's extortion of gay bars and the portrayal of the city as a gay magnet in the mayoral campaign, police and city officials moved into a three-year-long assault on ho-

mosexuals. They raided bars, patrolled parks where men cruised for sex, revoked liquor licenses, and shut down publication networks. Bar patrons and owners slowly began to respond. In 1961, José Sarria, a drag performer at the Black Cat, one of the city's more bohemian bars, entered the race for city supervisor. The following year, employees and owners of several gay bars formed the Tavern Guild, coordinating efforts to fight bar raids while also providing support for gay voter registration drives. In 1964, a new organization formed in close alliance with the guild, the Society for Individual Rights (SIR), which sought to combine the social world of bars and the activism of politics. SIR sponsored dances, bowling leagues, and art classes, but it also opened a gay community center in 1966 (the first such in the country), coordinated a venereal disease campaign, and, beginning in 1965, held candidates' nights to help situate gays as a voting bloc. During the same time, the city's gay organizers were joined by a handful of Protestant social justice clergy eager to work against homophobic discrimination. When the police raided a party to celebrate this new joint venture, the ministers spoke with outrage to the press and garnered support from the ACLU. Eventually, under increasing public pressure, the police department established liaisons with the gay community and largely stopped raiding gay bars. Thus, in San Francisco, the 1960s witnessed a new kind of organized activism: one that was firmly rooted in the social world of gay bars, but that also had firm support from outside the homosexual milieu. This proved a powerful combination.

By 1966, East and West Coast activists began, very slowly, to coordinate their activities once again, setting up the North American Conference of Homophile Organizations (NACHO). The growing public actions supported through NACHO seemingly inspired other groups to organize so that, by the spring of 1969, there were some fifty groups around the country; many of them operated outside of California and the Northeast New York–D.C.–Philadelphia triangle, including groups in Chicago, Kansas City, Seattle, Cincinnati, and Richmond, Virginia. In San Francisco, politicians began courting gay voters, with many of them attending candidates' nights organized by the various groups, and municipal officials met with DOB leaders to discuss their concerns. Nevertheless, the drop in bar raids also diminished the attendance at group meetings as the sense of urgency shrank. In New York, organized pressure against the police yielded a decrease in entrapment cases and court challenges. With the support of the New York Civil Liberties Union, stricter standards for shutting down gay bars were established, largely lifting the municipal ban on hiring homosexuals. Indeed, by the end of the 1960s, the national ACLU had declared itself firmly opposed to legal constraints on consensual sexual activity, and local chapters worked to challenge state laws against gay bars as well as federal employment restrictions. These supporters were joined by a growing number of clergy, as well as a handful of medical professionals who were keen on overturning the assessment of homosexuality as an illness.

In the last years of the decade, the growing militancy of the black civil rights movement and the emerging energy of the women's movement was reflected in increased passion among gay activists. A violent 1967 New Year's bar raid in Los Angeles provoked the largest public gay demonstration yet. Gay student groups began proliferating on college campuses, inspired by the rich atmosphere of student activism. Many of the younger activists tried to articulate and build connections between homophile activism and the other movements unfolding around them. The DOB president in 1968, for instance, insisted that lesbians needed to join the women's movement because even if "you've accomplished your aims in the homophile movement, you can proudly point to the fact that now lesbians have *full* second class citizenship, along with all women. That's nowhere near enough for me." Similarly, the new editor of *SIR's Vector Magazine* called on gay activists to build alliances with antiwar protesters and the Black Panthers, insisting that they "demand our personal liberty and freedom right NOW!" Clearly, the spirit of revolution that was inspiring young people across the country was shaping an increasingly militant gay activism as well.

That militancy displayed itself most famously late on a Friday night in June 1969 at the Stonewall Inn, a divey gay bar in the heart of New York's Greenwich Village. When the police raided the bar for liquor violations and directed most of the patrons to leave, the customers defiantly refused to go home. Instead, they gathered outside the bar and began to harass the police: first verbally, then physically, throwing coins, bottles, bricks, and a trash can. The police barricaded themselves in the bar until other officers eventually arrived to drive away the crowd. Yet crowds nearing 1,000 returned the following night and again later in the week and clashed more openly and violently with police in the surrounding streets. They taunted and sometimes chased the police, who returned their vol-

leys with blows from nightsticks and charges on horseback.

These Stonewall Riots and the resistance they embodied were thought to mark a dramatic turning point in gay and lesbian history, as the more conservative homophiles were suddenly superseded by younger, more aggressive activists demanding "gay liberation." Political and social organizations like the Gay Liberation Front and the Gay Activists Alliance quickly formed in New York City to build on the excitement of the riots, and similar groups soon spread across the country. In fact, gay activism and community building took off in the 1970s, and the growth in organizations and businesses quickly outstripped anything that had existed in the preceding decades. The homophile organizations soon faded away, and for those who had been unaware of the homophile efforts, gay liberation appeared to be a wholly new movement, born without precedent outside the Stonewall Inn. Indeed, most American gay pride parades occur in the last weeks of June to commemorate the riots as marking the birth of a gay rights movement.

Nevertheless, many of the achievements during and after the gay liberation era marked the full bloom of seeds planted much earlier by the homophile activists. Certainly, the gay liberationists' notion of homosexuals as an oppressed social minority, comparable to blacks, Mexican Americans, and even women, was an idea well articulated by Harry Hay and his leftist cofounders of the Mattachine Foundation. The social service and community centers that began to proliferate around the country during the 1970s—and became social welfare organizations during the AIDS crisis—drew upon the assistance and social support that the Mattachine Society and the Daughters of Bilitis provided to their members and clients in the 1950s. Only in the 1970s did the challenges to the federal Civil Service Commission and the psychiatric designation of homosexuality as an illness finally succeed, but those successes grew out of long campaigns begun in the 1950s and 1960s. The homophile activists of those decades laid down the foundation for much that would be built after them.

At the same time, their ability even to imagine a homosexual rights movement in the early 1950s was the product of a transformation that preceded them. The apparent Depression-era collapse of a culture celebrating gender marked a fundamental shift in how homosexual activity was perceived. Increasingly, same-sex activity became understood as the mark of a particular identity. This notion was reinforced in the 1930s and 1940s by the critical insistence of psychiatrists, police crackdowns, and military screenings and discharges. As these authorities attached negative identity labels to men and women seeking same-sex activity, those men and women began to celebrate and enjoy their discovery of one another. This combination of positive self-identification and negative authority labeling yielded a growing sense of individual and communal identity. And it was upon this emerging sense of identity that homophile activists, inspired by the cultural politics of postwar America, began to build their own social and political movement.

Lesbian, Gay, Bisexual, and Transgender Movement
1969–Present

Most scholars trace the birth of the modern gay rights movement to a 1969 New York police raid on a gay bar in Greenwich Village called the Stonewall Inn. Angered by the raid, bar patrons began a riot that lasted several days and mobilized the gay community throughout America. Newly mobilized homosexuals created new organizations that were more radical than the old homophile organizations, and developed the tactics and strategies still used by the movement today. The modern movement consists of a variety of political and social groups with hundreds of thousands of members and annual operating budgets in the millions. The movement has progressed on multiple fronts, gaining legal protections and helping to create an observable shift in public attitudes toward homosexuality. Nevertheless, the advent of AIDS and the rise of politically active religious conservatives led to a significant backlash against gay civil rights.

This section outlines the evolution of the gay rights movement, with particular focus on the political participation of gays and lesbians, protest politics, gay interest groups, public policy and law, openly gay government officials, and public opinion toward homosexuality. Each subsection examines change in each of these areas chronologically.

Political Participation: Voting and Political Parties

Political participation can include any activity from voting to writing a letter to an elected official to joining an interest group or political party. This section focuses on the electoral involvement of gays and lesbians, with particular attention on voting behavior and political party involvement.

Voting Behavior and Electoral Involvement

Voting in an election is clearly an individual act that may or may not be influenced by group affiliation or identification with a movement. However, scholars have argued that gays and lesbians do, more often than not, vote in a similar manner and thereby act as a voting bloc in the electorate. Mark Hertzog refers to this notion as the Lavender Vote thesis. Based on exit poll data from the 1980s and 1990s, Hertzog's research does support the Lavender Vote thesis. Although his research applies only to openly gay, lesbian, and bisexual persons who identified themselves as such to pollsters, he finds that gay voters constitute between 3 and 10 percent of the electorate, with higher representation occurring in urban areas. Gay voters also tend to have a group consciousness and to identify themselves with the gay movement, and gay voters make choices that are influenced by their sexual orientation. Hertzog concludes that although gay voters are not uniform in their beliefs, group consciousness or purposeful mobilization could ensure that LGB voters vote as a cohesive group.

In exit polls during elections, a small, but significant, portion of the voting population identifies itself as lesbian, gay, or bisexual. The size of the gay voting population is comparable to many racial, ethnic, and religious groups, including Hispanics and Jews. For example, in 1996 gays and lesbians constituted 5 percent of the electorate, comparable to 5 percent for Latinos and 3 percent for Jews. During the November 1998 midterm elections, exit polls suggested that 4.2 percent of voters were lesbian, gay, or bisexual. The figure was 4 percent in 2000, 5 percent in 1996, 2.2 percent in 1992, and only 1.2 percent in 1990. Furthermore, scholars find that the sexual orientation of voters has a significant influence on voting behavior, even after controlling for party affiliation, ideology, and issue positions.

Gay voters tend to vote for Democratic candidates and liberals. For example, according to Robert Bailey, in 1998 gay voters were almost twice as likely to vote for Democrats over Republicans. Gay voters sup-

ported Democratic congressional candidates by margins of 61 percent in 1990, 77 percent in 1992, 73 percent in 1994, 72 percent in 1996, and 85 percent in 1998. Gay Democratic support was strong even in years when most voters went Republican, such as 1994. But gay voters in each of these elections did support Republican congressional candidates in sizable numbers—39 percent in 1990, 23 percent in 1992, 26 percent in 1994, and 28 percent in 1996. Similar patterns of support for Democrats have occurred in each presidential election since 1988. In fact, during the 2000 election, exit polls suggest that 70 percent of gay voters went for Gore, 25 percent for Bush, and 4 percent for Nader.

The pattern of gay voters behaving as a voting block has been reinforced by gay movement efforts to register and mobilize gay voters. These efforts began during the 1980 presidential campaign when movement activists started Gay Vote 1980, a nationwide drive to pressure the major parties to adopt gay rights planks in their platforms, register gay voters, and mobilize these new voters to vote for gay-friendly Democrats. Similar efforts have been made in each presidential election cycle since 1980.

As gays have increasingly demonstrated their tendency to vote as a bloc, their ability to influence election outcomes, and thereby ensure the representation of their interests, has increased as well. Thus, the gay movement, by organizing voters and encouraging the identification of gay-friendly candidates, has been able to court political candidates and achieve movement policy goals, especially at the local and state level. In just one example, during the 1998 California race for governor, gays backed Democrat Gray Davis throughout the campaign. Even so, all three Democratic candidates attended a debate held by the Stonewall Democrats, a California gay political group. On Election Day, Bailey found that gay voters comprised 5 percent of the electorate, and gay voters may have provided Davis with his victory margin, with 73 percent of gay voters supporting him. Davis went on to be the most gay-friendly governor in California's history, signing key civil rights legislation addressing discrimination and same-sex couples, among other issues.

Political Party Involvement

Historically, most social movements that survive for any length of time tend to become involved in party politics by forming party-related groups, by ensuring members are selected as delegates to party conventions, by forming caucuses within the party, and by working for and contributing to the campaigns of party members. The gay rights movement has followed a similar pattern, first becoming involved in party politics at the local level in cities such as San Francisco, Los Angeles, and New York during the 1960s and 1970s. However, involvement in party politics quickly spread to state and national political parties as well. Indeed, during the 1972 Democratic National Convention, two openly gay delegates, Madeline Davis and Jim Foster, made history when they were allowed to give a televised address before the convention. In return for the strong primary election support from lesbians and gays in the party, 1972 Democratic presidential candidate George McGovern issued a seven-point gay civil rights plank that satisfied the demands of many gay activists at the time.

Although most movement activity in party politics in the United States has been with the Democratic Party, as early as 1972 gay Republicans were involved in party politics, even forming a group to reelect President Richard Nixon. But the Republican Party's focus on traditional family values has led to the belief that Republicans oppose nontraditional gender roles and homosexuality. Both elite and mass Republicans appear to hold these beliefs as public opinion polls show that Republicans are less likely to support gay civil rights. Nevertheless, gay Republicans have made their presence felt. The first time there was an organized and visible gay presence at a Republican National Convention was in 1984, when Ronald Reagan became his party's nominee for a second term. However, this presence did not prevent a conservative faction of the GOP from trying and failing to oust the newly formed Log Cabin Club, a gay Republican group, from the party in 1987. Gay Republicans gained strength, and in 1988 the party's nominee, Vice President George H.W. Bush, endorsed a plan to protect persons with AIDS from discrimination.

But the strongest relations between the gay movement and political parties have been with the Democratic Party. After courting the gay vote in 1976, and backtracking on a few promises, in 1977 President Jimmy Carter invited fourteen gay and lesbian activists to the White House for the first-ever official White House meeting between presidential staff and gays. In addition, in 1979 President Carter appointed open lesbian Jill Schropp to the National Advisory Council on Women in a White House ceremony. Following Carter's campaign, gay activists have been involved in the campaign of every major Democratic presidential candidate.

A nationwide drive to secure a gay rights plank

in the national Democratic Party platform, "Gay Vote 1980," resulted in about a dozen gay delegates in the Iowa caucuses. Indeed, gays were well represented at the 1980 convention. An openly lesbian delegate to the Democratic National Convention, Virginia Appuzzo, used her position to co-author the first gay civil rights party platform plank for a major political party in the United States. Appuzzo helped strengthen the language of the 1980 plank at the 1984 convention. The trend continued in 1982 during the Democratic Party's midterm convention in Philadelphia, where more than sixty-five lesbian and gay activists pressured the party to take a stronger stand on gay civil rights.

The 1992 election cycle proved to be a watermark, as gay activists jumped on Democratic candidate Bill Clinton's bandwagon, serving on his campaign and raising well over $3.4 million for his campaign and the Democratic Party. Clinton took notice and promised to drop the ban on gays in the military if elected. More movement activists also became directly involved in Democratic convention politics—at the 1992 Democratic National Convention 133 delegates were gay or lesbian, compared to 98 at the 1988 convention and 77 at the 1980 convention.

The Republicans responded by arranging a meeting between the chairman of the Bush-Quayle campaign and representatives of the National Gay and Lesbian Task Force in February 1992. Gay Republicans also took the opportunity to build their side of the gay movement, founding several new Log Cabin Clubs throughout the country, and gained media attention for the first openly gay delegates to the Republican convention.

In 1996, gays were again active on the Clinton campaign and with national Democratic Party activity, while Republican candidate Bob Dole initially refused a small campaign contribution from the main gay Republican group, the Log Cabin Republicans. Gay Republicans faced similar problems in state Republican Party politics. In 1998, the Texas GOP denied the Log Cabin Republicans (LCR) a booth at the state convention. State Party spokesman Robert Black even compared LCR to the Ku Klux Klan and said, "We don't allow pedophiles, transvestites or cross-dressers either." However, almost thirty LCR of Texas members attended the Republican Party of Texas State Convention in June 1998 as delegates or alternates. It was also the first year that gays held at least one precinct chair position in all major Texas urban counties.

In the 1990s, gay activists also made their voices heard in the Democratic Party through fund-raisers. From 1997 to 2001, gay activists raised record amounts for the Democratic Party through special dinners hosted by President Clinton. For example, in December 1999 gay activists raised a record-breaking $900,000 for the DNC at a luncheon hosted by President Clinton. The luncheon was the third gay fundraiser held by the DNC in three years, with the first event, in 1997, raising $290,000 and the second event, in 1998, raising $401,000 for the DNC. Furthermore, gay Democratic activists created the Stonewall Democrats in 1998, as a federation of forty-five local clubs with a total of 10,000 members. Most of the local clubs were previously independent local Democratic clubs involved in local and state party politics. In 1999, President Clinton nominated gay financial writer Andrew Tobias to be treasurer of the Democratic National Committee (DNC). The nomination placed Tobias in the highest-ranking position ever attained by an openly gay person in a major U.S. party. Tobias had made himself known to Democrats by making over $236,000 in political contributions, including $183,000 to the DNC since 1993.

The presidential campaign of 2000 involved the greatest amount of gay party activity and was exceedingly gay-friendly. The main Republican candidates softened their anti-gay rhetoric. For example, Senator John McCain (R-AZ) had supported gay staff members and gay officials and, like George W. Bush, did eventually meet privately with the main gay Republican group, Log Cabin Republicans. Senator McCain also was the first Republican presidential candidate to accept contributions from a gay group without hesitation. The Republican Party, led by George W. Bush, put on its most "diverse" face for its summer convention in its effort to attract female and minority voters. The Republican convention even featured the first openly gay person to speak at a Republican convention, Congressman Jim Kolbe (R-AZ).

On the Democratic side, openly gay people served on the DNC's site search committee for the 2000 national convention. Democrat Vice President Al Gore's presidential campaign had gays in key posts and gained the support of many national gay leaders. For example, lesbian Julian Potter campaigned for Gore in key primary states. Openly gay Jeffrey Trammell served as Gore's chief adviser on gay issues, and lesbian Donna Brazile served as Gore's campaign manager. As Gore faced the caucus and primary battles in early 2000, he met with twenty leaders of the National Stonewall Democratic Federation, a federation of local Democratic gay groups; Gore's Democratic opponent, Bill Bradley, also met with the group.

To capitalize on the gay vote, the National Stonewall Democrats (NSD) began a "Take Back the House" project, targeting swing districts where the gay vote was significant and where gay resources could influence the outcome. NSD endorsed twenty House candidates. In addition, the national Log Cabin Republican Federation endorsed thirty gay-friendly Republican candidates for the U.S. House. LCR made campaign contributions and ran its own radio ad campaigns that stressed the pro-gay voting records of endorsed congressional candidates in several key states.

In 2001, four openly gay people were named to positions in the DNC. Mark Spengler was promoted to base vote director, Campbell Spencer was named National Gay and Lesbian base vote director, Clay Doherty became the executive director of the Gay and Lesbian Leadership Council of the DNC, and Christine Kenngott was named the deputy director of marketing.

Lesbians and gays have also been involved in third-party politics, especially with the Libertarian Party, which is the third largest political party in the country. Through the work of gay members, the party has adopted several platform planks supportive of the gay rights movement. Since the 1980s, the party has endorsed a number of openly gay or lesbian candidates for local, state, and national office. In addition, gay activists have lobbied the Green Party to adopt a pro-gay party platform, and at least two openly gay people have run for local office under the Green Party label.

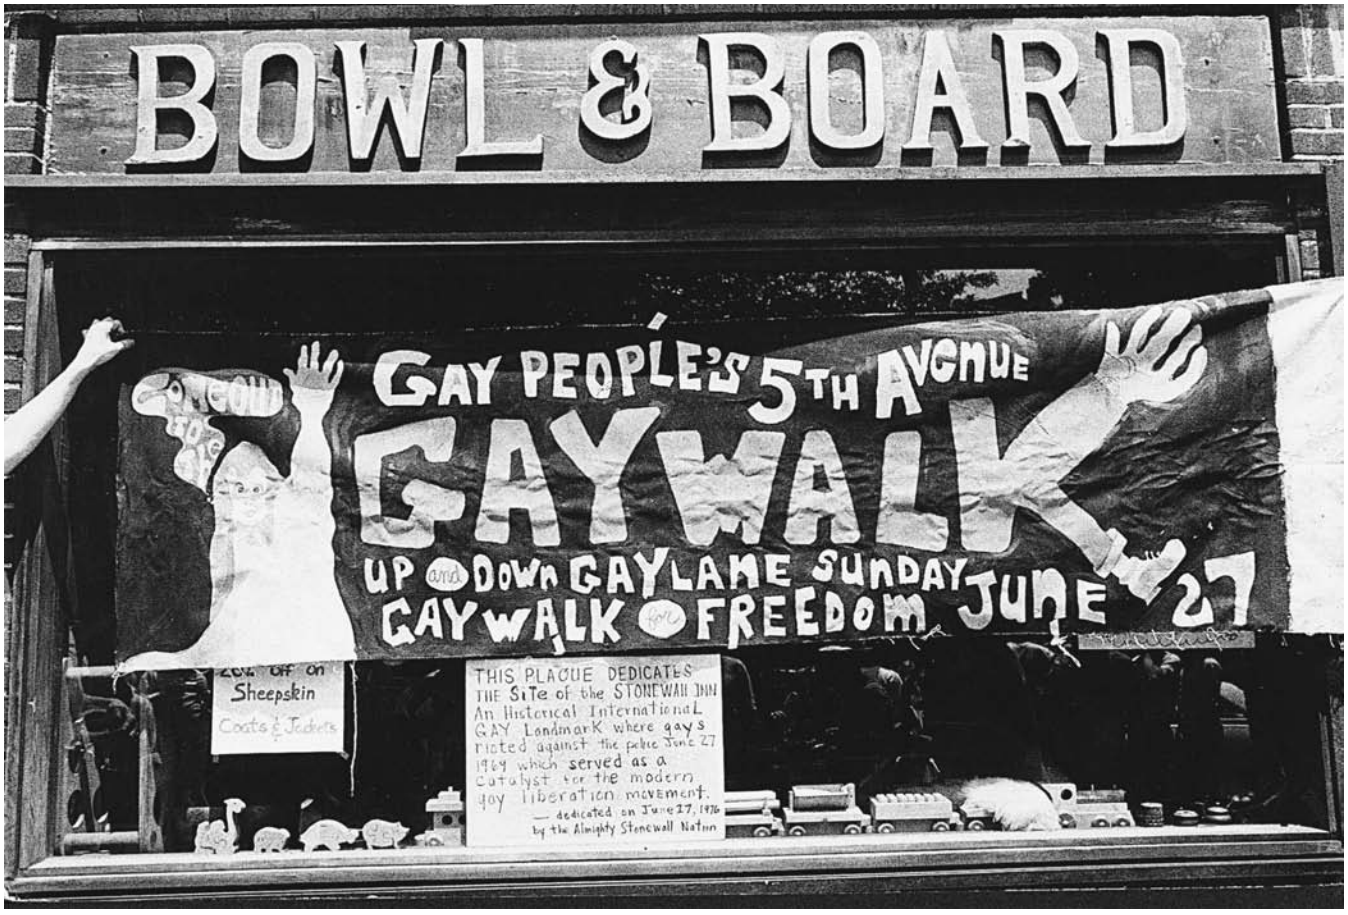
Protest Politics

Prior to 1969, the gay rights movement engaged in few activities that might be called protest politics or direct action tactics. Unlike most social movements, the early gay rights movement largely limited itself to private meetings, education efforts, and social activities. However, in the 1960s, some elements of what was then called the homophile movement began engaging in protest activity, largely at the local level, but some focused on the national government as well. The first use of collective protest at the national level to call for an end to employment discrimination against homosexuals is thought to have been a 1965 picket on several federal departments and agencies, including the White House. However, it was not until the late 1960s that such protest politics began to supersede conventional and assimilationist forms of political behavior within the movement.

The Stonewall Riots of 1969 gave rise to a relatively new branch of the gay movement, which some refer to as the gay liberation movement. The new branch focused on lesbian and gay liberation, as both personal liberation and societal liberation. They believed gay liberation could be achieved through unconventional lifestyles as well as through direct action or protest politics. In the years immediately following Stonewall, the basic unit of the movement became the consciousness-raising group, which focused on giving individuals space to develop a positive gay identity. As positive gay identities were developed, movement activists took to the streets and rejected formalized political participation. This faction of militants was "deeply suspicious of leaders, bureaucracies, and political parties," and directly challenged the movement structure homophile organizations had created. But as a whole the liberation arm of the movement was cemented in the notion that coming out and pursuing gay and lesbian visibility held the key to gay freedom. Protest politics was a natural activity given these beliefs.

New groups were formed following Stonewall, and although many focused on direct action as a political tactic, there were also those bent on using mainstream political tactics, such as lobbying, political party involvement, and campaign involvement. One example of these divisions started as the Gay Liberation Front (GLF), which formed immediately following Stonewall and primarily made use of more radical forms of political action, such as street protests. But soon after its formation, the GLF was divided over what political tactics to use and what issues to pursue. A faction supporting mainstream political tactics split from GLF to form the Gay Activists Alliance (GAA). However, GAA did combine direct action protests with more formal participation in political institutions. In fact, GAA both directly lobbied politicians and conducted "zaps" (organized protests) outside the homes and offices of politicians in its efforts to pass a New York City ordinance banning discrimination against homosexuals.

The gay movement became increasingly divided in the 1970s over the need for mainstream political participation versus street protests. Gay liberationists termed those who pursued mainstream participation "assimilationist." Furthermore, lesbians increasingly claimed there was a gender bias in the movement that was partly based on the notion of what forms of activism are appropriate. Although gay men increasingly focused on political participation within mainstream political organizations, many lesbians turned to creating a counterculture. The new lesbian counterculture was based in music festivals and other



When gay and transgendered patrons at Greenwich Village's Stonewall Inn in New York City resisted police harassment on June 27, 1969, it marked the emergence of the gay liberation movement. Seven years later, a "gay walk for freedom" commemorates the event. *(Bettye Lane)*

alternatives—clubs, bars, and bathhouses. Lesbians also formed new groups to reflect their opposition to a male-dominated movement, including Lesbian Feminist Liberation, which had previously been a faction of GAA. In addition, lesbian activists tended to favor protest politics and were opposed to hierarchical organizations and assimilationist politics.

Although protest politics continued to be included in the movement's repertoire of tactics through the 1970s, especially in states such as California, mainstream political activity became the norm for many movement activists. But with the advent of AIDS in the 1980s and growing frustration with slow government response, protest politics resurged in the movement. In the mid-1980s, AIDS drove a new generation of gay activists to focus on grassroots organizing and collective protest rather than legal reform and legislative lobbying. Groups such as ACT UP—an acronym for AIDS Coalition to Unleash Power—and the Lesbian Avengers formed and used protest politics in an attempt to speed the distribution of funding for AIDS, to promote the Food and Drug Administration's release of new drugs, and to end anti-gay discrimination.

Starting in 1990, chapters of a radical new gay protest group, Queer Nation, sprang up around the country. Queer Nation and the radical offshoot of ACT UP, Treatment Action Group (TAG), continued to practice direct action protests in the early 1990s, with Queer Nation holding kiss-ins and other events meant to garner media attention. Direct action also had an effect on the 1992 presidential campaign; the threat of protests by ACT UP in Little Rock, Arkansas, forced Democratic presidential candidate Bill Clinton to condemn an Arkansas sodomy law. But more moderate gay and lesbian activists routinely criticized the tactics of ACT UP and other protest groups, creating long-term divisions within the movement. And with

the exception of several marches on Washington and localized protest activities in the late 1990s, the tactic of direct action has been used less frequently. Evidence of the decline comes from a 1999 survey of gay groups in the 250 largest American cities. Only 20 percent indicated that they ever engage in street protests or marches, and none said that they used this tactic more frequently than mainstream tactics, such as meeting with public officials.

Interest Groups

As with most social movements, the gay rights movement has found a clear need to develop formal organizations to recruit members, engage in political activity, and more broadly educate the public. Indeed, some might argue that the gay rights movement, as a political movement, has always been an interest group movement, with most activity occurring within formalized groups. Although the movement clearly possesses counterculture and socially focused elements, gay interest groups have always been the most visible aspect of the political side of the movement.

Gay interest group activity, at one time limited to relatively secretive and anonymous low-activity groups, now includes every type of group and activity, from political action committees (PACs) to litigation and radical direct action groups. Gay participants in the movement and political system are also more diverse now than they were in the past, in terms of gender, race, ethnicity, and socioeconomic status.

The 1969 Stonewall riots mobilized many members of the gay community to form new social movement organizations at the local, state, and national levels. Older homophile organizations from the 1950s and 1960s, such as the Mattachine Society, the Society for Individual Rights, and the Daughters of Bilitis, did not adapt to the demands of the new generation of activists and were quickly replaced by new, more aggressive interest groups. In addition, the movement began to develop an increasingly national focus throughout the 1970s. Indeed, the oldest national gay group, the National Gay and Lesbian Task Force (NGLTF; originally the National Gay Task Force), was created in 1973 and set up shop in New York City. Meanwhile, existing and new local groups began to create specialized issue niches to ensure survival, as well as develop more democratic procedures for decision making within groups.

As the 1970s progressed, support for protest politics also declined within the movement. Many activists argued that it was time to shift the "battleground from the self and the streets to the corridors of power" by lobbying government, corporations, and the media. However, lobbying, litigation, and electoral campaigns require professional staff, fund-raising, and a network of communications. Thus, the need for more formalized, professional interest group organizations increased. Existing groups, such as NGLTF, responded to these pressures, but new groups, such as the Gay Rights National Lobby, which formed in 1978, were also created.

The rise of the religious Right and its anti-gay ballot initiative campaigns during the late 1970s also created pressures to establish new interest groups and coordinate the efforts of existing groups. For example, after the first round of anti-gay ballot initiatives to repeal gay civil rights laws in 1977, activists met in Denver at the National Gay Leadership Conference. The over 400 representatives from various gay groups determined that the movement had to focus on education, legislation, and organization.

With the advent of AIDS during the 1980s, the need for formalized permanent interest groups only became stronger. To raise funds for professional staff, including lobbyists and lawyers, groups became increasingly membership-based and sought large wealthy donors. Furthermore, AIDS focused more attention on Washington, D.C., and national groups came to dominate the movement over local groups. In fact, by 1986 the NGLTF had relocated from New York to Washington, D.C., and the movement's largest litigation group, the Lambda Legal Defense and Education Fund (LLDEF), increased its size and its caseload. In addition, the Gay Rights National Lobby, which had tried to build a national grassroots network to support lobbying at the national level, was merged with the Human Rights Campaign Fund (later the Human Rights Campaign [HRC]), and the new group restructured itself so that group leaders in D.C. had full control of the organization, its tactics, and strategy.

The movement also created new local and national groups specifically to address AIDS and to lobby government for research funding and services. In addition, state groups began to form in opposition to draconian AIDS proposals in state legislatures and in direct democracy initiatives at the ballot box. Elements of the religious Right were arguing that AIDS was God's punishment for immoral behavior; gay activists were forced to respond by increasingly professionalizing their staff and fund-raising techniques, nationalizing their focus, and framing their arguments so as not to offend mainstream heterosexuals. In fact, groups representing the new AIDS sector of the move-

THE NATIONAL GAY AND LESBIAN TASK FORCE

The National Gay and Lesbian Task Force (NGLTF) is the oldest surviving national gay and lesbian interest group in the United States. Formed in 1973, the group has a lobbying arm and a Policy Institute. The task force is not structured as a federation of local chapters, but the group's literature suggests that since 1996 it has been trying to build a grassroots movement with state and local groups. To accomplish this goal, the task force holds an annual Creating Change Conference attended by thousands of activists, started its Youth Leadership Training program in 1993, and has built partnerships with more than 120 groups through its Cooperating Organization program.

The task force sponsored the creation of the Federation of Statewide Lesbian, Gay, Bisexual, and Transgendered Political Organizations in 1997 and has provided critical support to its success. The goal of the federation is to build statewide organizations in all fifty states. In 1999, NGLTF, through the federation, launched a national campaign called Equality Begins at Home. The campaign organized 350 rallies and political and cultural events in all fifty state capitals.

The task force addresses many issues, including antidiscrimination policies for gays and lesbians, anti-gay ballot measures, general homophobia, harassment, and violence against gays and lesbians, sodomy laws, legal protections for gay and lesbian families, and funding of AIDS research and related healthcare. NGLTF goals and strategy are decided in the national office—the structure of the group allows for limited input from local members and lessens conflict within the organization. Although the task force often attempts to coordinate its activities with local and state groups, tensions between itself and other national groups (especially the Human Rights Campaign) have sometimes restricted its cooperation with most national groups.

By 1995, NGLTF had a budget of $3.1 million and, by 1996, 35,000 members and a staff of twenty-one. By the late 1990s, the group began to face some criticism as well as staff turnover and budget problems. Nevertheless, in 2000 NGLTF had grown to a full-time staff of thirty-five and a budget approaching $4.4 million. However, in 2001 the group's budget dropped to $3.6 million, and membership levels remained at about 35,000 as the NGLTF continued to face something of an identity crisis.

Even with its recent problems, NGLTF has built an impressive record of accomplishments. In 1975, the group convinced the U.S. Civil Service Commission to make a ruling allowing homosexuals to serve in government employment. That same year the group helped convince U.S. Representative Bella Abzug (D-NY) to introduce the first gay rights bill in Congress. In 1978, NGLTF released the first-ever study of sexual orientation discrimination in private companies. Between 1982 and 1984, the task force became the first national group to give significant attention to hate crimes. It launched a national project on hate crime, established a crisis hotline, and began a series of reports on anti-gay hate crime. The actions culminated in the group's leadership of the national hate crimes coalition, which passed the 1990 Hate Crimes Statistics Act. In 1991, the task force began a national antidiscrimination campaign against the Cracker Barrel restaurant chain, began the Families Project with the National Center for Lesbian Rights, gave the first briefing on people of color and AIDS to the Congressional Black Caucus, and developed the Fight the Right Action Kit for activists.

The NGLTF started its Policy Institute in 1995, as well hosting the first Youth Leadership Training camp and held the first Progressive People of Color Grassroots Organizers Summit. And in 1996 NGLTF coordinated simultaneous grassroots events in thirty-six communities across the country to raise awareness about the Supreme Court ruling on opposition to Colorado's Amendment 2. In the late 1990s, the task force began publishing important first-ever reports on everything from gay voting to gay-related legislation in the states. Indeed, NGLTF's publications on gay civil rights, voting, and state legislative activity, among others, have been indispensable for activists and researchers.

Donald P. Haider-Markel

ment felt these pressures even more keenly and quickly moved to become part of medical and service sector bureaucratic structures.

By the late 1980s and early 1990s, the universe of gay interest groups had become increasingly diverse, as new, more specialized groups formed, and older, more generalized groups tended to die out. At the national level, involvement with the movement has increasingly come to mean writing a check rather than more direct forms of participation, such as attending

meetings. The largest national groups were, and still are, the NGLTF and the HRC. Both groups have focused their attention on lobbying government officials, coordinating with local and state activists on policy issues, and becoming involved in political campaigns. Through its affiliated PAC, HRC has grown to become one of the fifty largest PACs in the country.

Lambda Legal Defense and Education Fund quickly became the largest national group focused on protecting and expanding gay civil rights through litigation, and in the 1990s the group expanded its operations by establishing several new regional offices. As a rule, the surviving generalized gay groups are much larger than the more specialized groups. However, Parents, Families, and Friends of Lesbians and Gays (PFLAG) is probably the greatest exception to this general rule. PFLAG has established over 100 local chapters around the United States, fosters grassroots input, and works to coordinate the activities of local groups. As its name suggests, however, PFLAG is largely composed of heterosexuals, which makes it more specialized than the other large groups.

Gay Republicans, while still being kept at arm's length by their party in the 1990s, began to play a larger lobbying role in the movement through their organization, the Log Cabin Republicans (LCR), a federation of local clubs focused on electing and educating moderate Republican politicians on issues such as AIDS. LCR first formed as a local group in California in 1978, but several local clubs merged in 1990 and finally became the LCR in 1995. In the 1990s, LCR assisted in the gubernatorial elections of Pete Wilson in California and William Weld in Massachusetts. Wilson was a disappointment on gay issues, but Weld became one of the most pro-gay governors in the country. LCR formed an affiliated PAC in 1996 and since then has contributed thousands of dollars to the campaigns of moderate Republican candidates. In April 2002, President Bush invited some fifty LCR leaders to an official White House briefing in an administration effort to indicate appreciation for LCR's campaign support in 2000. Although Democratic presidents or advisers had met with gay activists on several occasions, this was the first time a Republican administration invited gay activists to the White House.

Gay PACs became even more specialized in 1991 when movement activists formed the Gay and Lesbian Victory Fund, a PAC focused solely on electing openly lesbian and gay candidates to political office at all levels of government. By 2001, the Victory Fund had contributed over $2 million to hundreds of candidates; it typically sees at least 70 percent of its endorsed candidates elected.

At the national level, participation in and contributions to these groups increased significantly in the 1990s and early 2000s. From 1993 to 1995, the number of individual contributors to the largest six gay groups increased 161 percent, and from 1995 to 1997, the number of contributors increased 82 percent, from 203,000 to 370,000. During the 1990s, most national groups also saw their budgets significantly increase, and in 1997, the largest eleven national groups had a combined budget of almost $26 million. In 1999, the budgets of these groups increased to nearly $40 million, even though some groups, such as the NGLTF, began to see budget declines. Although these figures are impressive, the budgets of the largest six religious conservative groups opposed to gay rights, including Focus on the Family and the Christian Coalition, added to a combined total of $404 million in 1999. Finally, a 2001 survey of the eleven largest national gay groups by *The Washington Blade* found that the budgets of these groups grew 24 percent from 1999, to nearly $50 million.

State and Local Groups

National groups have clearly come to dominate the gay movement since the late 1970s, but local and state interest groups have played a critical role in the movement's evolution. Moreover, as national groups have increasingly begun to recognize that their lobbying and campaign activity is disconnected from grassroots lesbian and gay activists, they have turned their attention to building bridges and coordinating with these groups. Nevertheless, there is an ongoing debate in the movement over where efforts should be focused, nationally or in the states.

Outside of a few states, most gay movement activity at the state level was relatively haphazard until 1988. Prior to 1988, some groups had formed in states like California and Oregon to fight against anti-gay ballot measures, but most of these groups were temporary. In addition, key activists had lobbied on their own in state legislatures, such as Wisconsin and New York, but most lacked the resources of formal organizations. During the 1990s, statewide gay groups increasingly formed and began to lobby government officials, contribute to and participate in electoral campaigns, and initiate litigation in state courts to expand or protect the rights of lesbians and gays. Much of the state-level lobbying since the 1980s has been focused on passing laws banning discrimination because of sexual orientation, repealing homosexual

sodomy laws, obtaining AIDS funding and legal protections for persons with HIV/AIDS, ruling against hate crime, and more recently, allowing same-sex marriage.

Beginning with a scattering of groups in the late 1980s, the number of formal and continuously active gay groups active in state politics grew to thirty-six by 1998. According to a *Washington Blade* survey of those groups, about one-third had two or more paid professional staff, another third had only one paid staff member, and the remainder use all-volunteer staff. In addition, some of these groups are able to hire temporary professional lobbyists to lobby state government, a pattern similar to that used by other single-issue and social issue groups in the states. The number of state groups grew to thirty-eight in 2001, but fewer than ten of these groups appear to have much influence in state politics.

At the local level, the number and activities of gay groups have been difficult to track. Clearly, many gay activists in the movement have gotten their start with local groups, but many of these groups exist for only a short time, sometimes dying off, and other times being merged with other like-minded groups.

In 2001, about 800 local gay political groups were active, but perhaps twice that number of gay social and cultural groups were in operation. On average, these groups tend to be small, typically maintaining a membership base of fewer than fifty people. However, approximately 150 to 200 of these groups have some type of operating budget and even paid staff. Local groups engage in many of the same activities as national and state groups, including lobbying government officials, working on political campaigns, and educating the public. However, local groups are somewhat more likely to engage in direct action tactics, such as street protests, than are state or national groups.

Public Policy and Law

In one way or another, most social movement activity intends to directly or indirectly influence public policy—what government does. The political activities of gays and lesbians discussed so far, voting, party politics, protest politics, and interest group formation and involvement, are all efforts to indirectly or directly influence government policies regarding homosexuals and homosexuality. Although some government actions prior to 1969 were positive for the gay community, such as U.S. Supreme Court rulings allowing homosexual groups to use the U.S. mail, state actions to repeal homosexual sodomy laws, and laws to end local police harassment of gay bars, the movement achieved few policy victories until the 1970s.

National Policy

Of the multitude of federal court decisions that impact the lives of gay men and lesbians, four of the most significant legal cases to address homosexuality and the civil rights of lesbians and gays have been decided by the U.S. Supreme Court since 1969. The four cases were *Bowers v. Hardwick* (1986), *Romer v. Evans* (1996), *Boy Scouts of America v. Dale* (2000), and *Lawrence and Garner v. Texas* (2003).

In *Bowers v. Hardwick,* the Supreme Court rejected the right to privacy claims of a man convicted of illegal homosexual sex under Georgia's law banning sodomy. In *Boy Scouts of America v. Dale,* the Court ruled that the Boy Scouts of America could ban homosexuals from their organization in order to maintain the moral objectives of the organization. Thus, in these two cases, which have guided lower court decisions in a variety of gay-related issues, the Court upheld as constitutional discriminatory treatment of homosexuals and refused to accept the notion that privacy rights extend to homosexual behavior.

However, in *Romer v. Evans* the Court ruled that Amendment 2, a law passed by ballot initiative in Colorado that would have repealed existing gay civil rights laws and blocked the enactment of new laws, was unconstitutional because the law violated the equal protection rights of homosexuals. Specifically, the law would have unconstitutionally prevented homosexuals from using the political process to achieve policy goals. Furthermore, in *Lawrence and Garner v. Texas* the Court overturned a Texas law banning homosexual sodomy largely on the argument that the ruling in *Bowers* was wrong, and that the right to privacy embedded in the Constitution made all laws banning sodomy, heterosexual or homosexual, unconstitutional. Although the decisions in *Bowers v. Hardwick* and *Boy Scouts of America v. Dale* were major defeats that left gays vulnerable to discrimination and harassment, the rulings in *Romer* and *Lawrence* may have established the platform on which LGBT equality is assured.

In Congress gay and lesbian issues were largely ignored prior to the 1970s. A few exceptions to this rule included congressional investigations into gays as a security threat and a 1960s effort to end the political activities of a Washington, D.C.-based group. It wasn't until 1974 that any pro-gay measures were introduced in Congress. That first bill would have pro-

Army veteran Dane Hays, who served in both the Vietnam War and the Gulf War, marches in the Lesbian and Gay Pride March in New York City on June 25, 1995. Marchers urged an end to discrimination in the armed forces. *(AP Wide World Photos)*

vided civil rights protections to homosexuals and was proposed by groups such as NGLTF, which convinced two New York representatives to introduce the bill in the House. The bill did not even receive a committee hearing, but similar bills were introduced each year until committee hearings were finally held in October of 1980. The previous year, leaders of the Gay Rights National Lobby had convinced Senator Paul Tsongas (D-MA) to introduce a similar bill in the Senate for the first time.

In the late 1970s, gay interest group leaders increasingly gained access to Congress and were invited to testify in congressional hearings on a number of issues. The hearings covered diverse subjects, including the funding of venereal disease clinics that focused on homosexuals, homosexuality on television, alcoholism among lesbians, the impact of welfare reform on homosexuals, revision or elimination of Washington, D.C.'s sodomy law, homosexuality in prisons, the access of special interest groups to telecommunications, including questions in the census to identify homosexuals, and the repeal of federal welfare benefits to homosexuals under HR 4122, the Family Protection Act of 1979.

Anti-gay opponents, however, fought back. In the late 1970s and early 1980s, members of Congress opposed to gays used the amendment process to prevent the Legal Services Corporation from using any of its funds to deal with homosexual issues or to promote gay rights, and to prevent the District of Columbia from repealing its laws against homosexual sodomy. These efforts coincided with the rise of an anti-gay backlash, led by the religious Right, a backlash that was first manifested in several state and local direct democracy efforts to repeal or ban legal protections for gays.

As the 1980s progressed, it became clear that AIDS was decimating the gay community. Gay groups had mobilized to force government action on the issue, but Congress did not allocate specific funds until 1985. However, Congress began holding hearings on the disease that came to be known as AIDS as early as 1982, and once Congress began to act on AIDS, the gay movement began to find more support in Congress, largely from northern Democrats and moderate Republicans. However, conservatives in Congress, such as Senator Jesse Helms (R-NC), also consistently used AIDS funding legislation as a vehicle for passing amendments to prohibit the use of any federal funds in "promoting" homosexuality.

In the late 1980s, gay groups were largely able to defend against conservative attacks directed at the National Endowment for the Arts (NEA) in a series of battles that arose because of NEA funding of what some legislators referred to as "homoerotic" art. National gay groups were also successful in building liberal coalitions to pass the 1990 Americans with Disabilities Act, which included legal protections for persons with HIV/AIDS; the 1990 Hate Crime Statistics Act, which required the Federal Bureau of Investigation (FBI) to collect statistics on hate crimes motivated by bias toward the victim's race, ethnicity, gender, or sexual orientation; and the Ryan White CARE Act of 1990, which provided ongoing funding for AIDS treatment and research.

Some of these victories in the early 1990s were quickly followed by major defeats. In 1993, the movement, even with the support of the president, was un-

able to convince Congress to overturn the ban on homosexuals serving openly in the military. Instead, existing administrative rules were replaced with the now infamous "don't ask, don't tell" policy, and in 1996, Congress passed the Defense of Marriage Act, which banned persons in same-sex marriages from receiving a number of government benefits. In addition, following two decades without a floor vote, legislation that would have banned sexual orientation discrimination was narrowed to cover only discrimination in employment in 1994. When this watered-down bill (the Employment Nondiscrimination Act) finally reached its first floor vote in 1996, the Senate killed it in a tight (50–49) vote. The remainder of the 1990s saw minor victories and losses for the gay movement in Congress. But in December 2001 Congress finally lifted its ban preventing the District of Columbia from using federal funds to operate its domestic partner benefits program for city employees—Congress had upheld the ban since 1993.

Outside of Presidents Carter and Clinton, the executive branch has paid little attention to the gay rights movement, but movement lobbying did lead to some actions. In 1975, the U.S. Civil Service Commission ended the ban on the hiring or retaining of homosexuals, and in 1976 the Immigration and Naturalization Service limited its ban on homosexual immigration to only those who had been convicted of sex crimes. A policy barring gays from employment in the Foreign Service was lifted in 1977, the same year that gay and lesbian activists were invited to the White House for the first time, and the Internal Revenue Service canceled a policy that had forced homosexual education and charity groups to publicly state that homosexuality is a "sickness, disturbance, or diseased pathology" before being given tax-exempt (501) status.

After initially responding slowly in the 1980s to AIDS, federal bureaucracies such as the National Institutes for Health bowed to pressure from gay activists and increased their funding for HIV/AIDS research. President Clinton took office in 1993 after having heavily courted the gay community in the 1992 campaign. Although Clinton was unable to fulfill his promise of overturning the ban on gays in the military, he quickly began appointing open gays and lesbians to executive branch positions, some of which required Senate confirmation, and established the first official liaison office for the gay community. President Clinton also supported congressional legislation protecting gay civil rights and strengthening federal hate crime laws. When Congress refused to act, President Clinton signed an executive order in 1998 prohibiting civilian federal departments, agencies, and commissions from discriminating on the basis of sexual orientation. An attempt by Congress to overturn the order was blocked, and by 2002 most federal civilian departments, agencies, and commissions had instituted programs to reflect the order.

State and Local Policy

Although the movement has clearly made inroads at the national level, its greatest policy accomplishments have occurred at the state and local levels, especially in the areas of antidiscrimination laws, hate crimes, domestic partner benefits, and the repeal of laws banning homosexual sodomy. Figure 1 dramatically shows how the movement has built an impressive record of local policies banning sexual orientation discrimination. Gay activists have fought for and passed these laws in well over 200 localities since 1972. The laws typically cover public employees, but some cover discrimination in other areas, including private employment, credit, and housing. Based on state and local laws, about 38 percent of the U.S. population is protected from sexual orientation discrimination in private employment, and about half of the U.S. population is protected from sexual orientation discrimination in public employment.

Wisconsin was the first state to pass an antidiscrimination law when it banned discrimination based on "sexual preference" in 1982. Since then, another twelve states have passed statutes to ban discrimination based on sexual orientation in public employment; another five states have similar laws through gubernatorial executive orders. In 1993, Minnesota became the first state to add gender identity to its civil rights laws, and two other states soon followed. Another twenty-seven local governments have adopted similar policies since 1990.

In the absence of legal marriage, some movement activists have called for other forms of legal recognition for same-sex partners. One type of recognition is a domestic partner registry. Same-sex partners meeting certain criteria apply for the registry, pay a fee, and receive a certificate from the government that formally recognizes their commitment to one another. In some areas this registry also provides certain legal rights, such as hospital visitation rights. By 2002, at least forty-one localities in California had some type of domestic partner registry. In addition, Vermont adopted the first civil union law in 2000, providing legal recognition of same-sex partners and most of the legal benefits and obligations of marriage. Through

Source: Data compiled by the author based on information from the National Lesbian and Gay Task Force and keyword searches of LexisNexis newspaper archives.

legislation and litigation efforts by gay groups, eight states and eighty-three local governments have begun to offer domestic partner benefits for the partners of public employees. These benefits typically include health and dental insurance coverage. In addition, a few cities, such as San Francisco and Atlanta, have passed laws requiring companies with city contracts to offer domestic partner benefits to their employees.

State and local legislation addressing movement policy goals has generally been on the increase since the late 1980s. But prior to 1993, few pro-gay bills were introduced. Two additional areas of concern for the gay rights movement at the state level have been hate crime and laws banning homosexual sex. Early repeals of laws banning homosexual sex, typically called sodomy laws or laws banning "crimes against nature," began in the 1960s when many states were revising their criminal codes. However, activists began focusing on these laws in the 1970s, seeking legislative repeal. In those states where legislative repeal seems remote, gay groups have challenged these laws in court. Indeed, the *Bowers* v. *Hardwick* case discussed above was a challenge to Georgia's sodomy law. By June 2003, the Supreme Court nullified all sodomy laws in its ruling on the constitutionality of a Texas law banning sodomy. Only thirteen states had not repealed, through court decisions or legislation, laws banning homosexual sex.

Another area of significant concern for gay groups at the local and state levels has been hate crime. Hate crimes are crimes committed wholly or in part because of the victim's perceived status or group affiliation, such as being a homosexual. Starting in the 1980s, local and state gay groups have attempted to combat hate crime in several ways, including establishing street patrols, creating counseling services and hotlines for reporting hate crime, working with police on training programs for the identification and pursuit of hate crime, and lobbying for local and state policies that track hate crime, allow for civil penalties, and enhance criminal penalties for hate crime. By 2001, at least twenty-seven states and twelve local governments had adopted at least one of these policies.

The gay movement at the state and local levels has also faced political battles in direct democracy campaigns. In many U.S. localities and twenty-four states, citizens can petition the legislature (referendum) or directly place policy questions (initiative) before voters after collecting a set number of voter signatures. If the proposal passes by popular vote, it becomes law. Citizens draft these proposals, and they cover virtually every topic. The gay movement has been involved in these ballot contests by placing their own proposals on the ballot—typically measures to ban discrimination based on sexual orientation—but most of these measures fail. In fact, since 1972 at least thirty-two pro-gay measures have been voted on in

HARVEY MILK (1930–1978)

Born on May 22, 1930, in Long Island, New York, Harvey Milk graduated from Albany State College in 1951. Milk entered the U.S. Navy shortly thereafter and advanced to the rank of chief petty officer on the *USS Kittyhawk* during the Korean War. He was dishonorably discharged when his homosexuality was discovered. He returned to Manhattan to become a Wall Street investment banker.

Milk moved to San Francisco, California, in 1969 and operated a camera store. He served as an advocate for local businesses in dealing with the municipal government. To help his neighboring merchants cooperate more effectively with the city government, Milk founded the Castro Valley Association (CVA). Through the CVA, Milk organized the gay community along political lines and made alliances with labor unions and political leaders. After four unsuccessful attempts, he was elected to San Francisco's Board of Supervisors in 1977. His election came at the same time the national political scene was becoming increasingly conservative and less tolerant of minority opinion, epitomized by anti-gay activist Anita Bryant's campaign "Save Our Children."

One of the first openly gay elected officials in California, Milk was instrumental in passing the city's gay rights ordinance. After serving only eleven months, and at the peak of his influence in gay civil rights even on the national scene, Milk was shot to death. Former city supervisor Dan White shot and killed Milk and Mayor George Moscone on November 27, 1978. White had resigned his seat on the board following the enactment of the Gay Civil Rights bill, which he had opposed. White's attorney argued that the defendant could not be held accountable for his actions because the amount of junk food he had eaten on the day of the shootings had exacerbated White's depression. The "Twinkie defense," as it is now known, worked and White received a conviction of only two counts of voluntary manslaughter and a prison sentence of seven years and eight months. White's sentence triggered a riot in San Francisco's homosexual community. After serving only six years, White was paroled and committed suicide a short time later. Milk's assassination brought Milk something that was then rare for openly gay men—mainstream empathy.

James G. Lewis

local and state elections, but only 31 percent of these measures have passed. But perhaps most important, since 1977 opponents of gay civil rights have used the direct democracy process to repeal or ban gay civil rights laws. Gay rights opponents have been far more successful in these contests, passing 71 percent of the ninety-two measures voted on since 1977. And although the courts have frequently overturned these measures, it seems clear that gays and lesbians tend to lose when their civil rights are decided in a majoritarian arena. The upshot for the gay movement has been that the battles to defeat these measures have often led to the creation of new local or statewide gay interest groups that continue to mobilize the gay community even after the measures are voted on.

Openly Gay and Lesbian Public Officials

In any democratic system a central concern is political representation. One means by which we can evaluate the success of the gay movement is in terms of the movement's ability to achieve symbolic representation through the election or appointment of government officials that belong to or identify with the movement. Furthermore, research suggests that the likelihood that governments will adopt at least some of the policies discussed above is enhanced by the presence of openly lesbian or gay elected officials. The gay rights movement has clearly recognized these important elements of representative democracy and since 1969 has increasingly focused on the election and appointment of openly gay or lesbian officials at the national, state, and local levels.

There are over 500,000 elective offices in the United States and perhaps five times that number of government positions for which someone has to be appointed by a legislature or executive. Although gays hold very few of these positions, their numbers have been steadily increasing since the 1970s. The first openly gay person to run for public office was Jose Sarria, who ran for the San Francisco Board of Supervisors in 1961. Sarria lost his race but helped to inspire gays and lesbians, such as Harvey Milk, to run for public office throughout the 1970s. Most of these candidates lost their races as well, and by 1987 the movement could claim only twenty openly gay elected officials in the country. By 1990, a total of fifty openly gay officials had served in public offices across America. In 1991, there were only fifty-two openly gay elected officials; by April of 1998 there were at least

One of the nation's most prominent openly gay politicians, San Francisco Supervisor Harvey Milk acknowledges supporters during the Gay Freedom Parade on June 26, 1978. He would be assassinated five months later. *(AP Wide World Photos)*

146 gay elected officials holding office in twenty-seven states and the District of Columbia, and by 2002 that number had risen above 200.

By 2002, the movement could claim significant success at the ballot box, with increasing numbers of lesbians and gays running for and winning local, state, and national elections. In 2002, there were three openly gay members of Congress, including Rep. Tammy Baldwin (D-WI), the first open lesbian elected to Congress, and the first nonincumbent open lesbian or gay elected to Congress. At the state level, increasing numbers of gays have been elected to state legislatures and even executive branch positions. Arizona has been a leader in the election of openly gay officials, with a gay member of Congress, two openly gay state legislators, and a city (Tempe) that is the largest city in the country with an openly gay mayor. States such as California have considerable numbers of gay officials in state and local offices (thirty-six), while New York has at least seventeen. Moreover, some cities, such as Wilton Manors, Florida, even have a gay majority on their city councils.

The number of openly gay state legislators has risen dramatically since 1996, but the first openly gay state legislators were Elaine Noble (Massachusetts House) and Allan Spear (Minnesota Senate). Noble came out first in 1974 as an open lesbian after being elected and went on to serve two terms. Spear was first elected to the state senate in 1972 and came out in 1974, serving until he retired in 2000. In addition, the first transgender state legislator in the county was Althea Garrison, elected in 1992; she served only one term in the Massachusetts House of Representatives.

At the local level, gays have most often served on city and county legislatures but have held a variety of executive positions, including mayor and sheriff. Since 1983, at least twenty gay individuals have served at least one term as mayor. At least 130 openly

Leaders of the Spirit of Stonewall, one of many groups spawned by the gay liberation movement of the late twentieth century, speak to reporters on June 24, 1994. The legendary Harry Hay, founder of the Mattachine Society and the Radical Faeries, is third from left. *(AP Wide World Photos)*

gay persons have occupied seats on local legislatures, and representation has increased over time, especially during the 1990s. However, the first openly gay elected official (for any office) in the county was Kathy Kozachenko, who was elected to the Ann Arbor, Michigan, City Council in April 1974. Other positions held by open gays and lesbians at the local level include seats on special commissions, neighborhood committees, planning boards, local party organizations, school boards, community college districts, and courts.

Finally, movement representation through the appointment of open lesbians and gays to government positions has also been aggressively pursued by gay activists and has generally been on the increase since the 1970s. However, because many of these positions are relatively obscure, no systematic data exist on the number of open gays and lesbians appointed to local, state, or national positions.

President Carter was the first president to appoint an openly gay person to a national office, and Presidents Reagan and Bush did not appoint any open gays to office. President Clinton repaid the gay movement for its support of his 1992 and 1996 campaigns by appointing 150 open gays and lesbians to positions in the executive branch and the White House. However, the names of only twenty-six of these appointees were ever released, and only five of these appointments required Senate confirmation. Although President George W. Bush suggested during the 2000 presidential campaign that he would not appoint an open homosexual in his administration, the strong electoral support provided to him by groups such as the Log Cabin Republicans apparently convinced him to appoint seven open gays to his administration by March 2002 over the objections of religious conservatives. However, the White House never publicly stated any of these officials were gay, and the White

House press secretary, Ari Fleischer, "said a person's sexual orientation is irrelevant to the appointment process."

At the state and local levels, at least 200 gays and lesbians have been appointed to positions in government, but the actual figure is certainly much higher. These local and state positions have included seats on courts, coastal commissions, zoning boards, human rights commissions, and boards of trustees for state university systems. The first appointment to a local or state position occurred in San Francisco in 1973 when the mayor appointed lesbian Jo Daly to the city's Cablevision Task Force. Over time, appointments became more diverse and significant, offering gays access to the halls of power. In 1998, Reform Party Minnesota governor-elect Jesse Ventura even selected openly gay Steven Bosacker to lead his transition team. Bosacker went on to become Ventura's chief of staff in 1999. In California, Governor Gray Davis thanked the gay community for their 1998 electoral support by appointing at least thirty-seven high-level, open gays and lesbians to his administration by March 2002.

Public Opinion

Perhaps the most dramatic impact of the gay rights movement can be seen through changes in public opinion about homosexuals and homosexuality since 1969. Public support for the civil rights of lesbians and gays has increased considerably in the past thirty years, along with support for openly gay candidates and tolerance of homosexuality and same-sex sexual relations.

For example, the percentage of Americans who believe that homosexual sex should be illegal has generally declined over time. In 1977, the Gallup Poll asked national adults if "homosexual relations between consenting adults should be legal or illegal?" Almost 43 percent of respondents said illegal and 43 percent said legal. The percentage of respondents saying that homosexual sex should be illegal spiked in the middle of the AIDS scare in 1988 at 57 percent, but by 2001 the percentage of respondents saying it should be legal became a majority for the first time at 54 percent. Similar questions have been asked in the General Social Survey since 1972, and after 1991, the percentage of respondents believing that same-sex sexual relations are sometimes not wrong or never wrong nearly doubled.

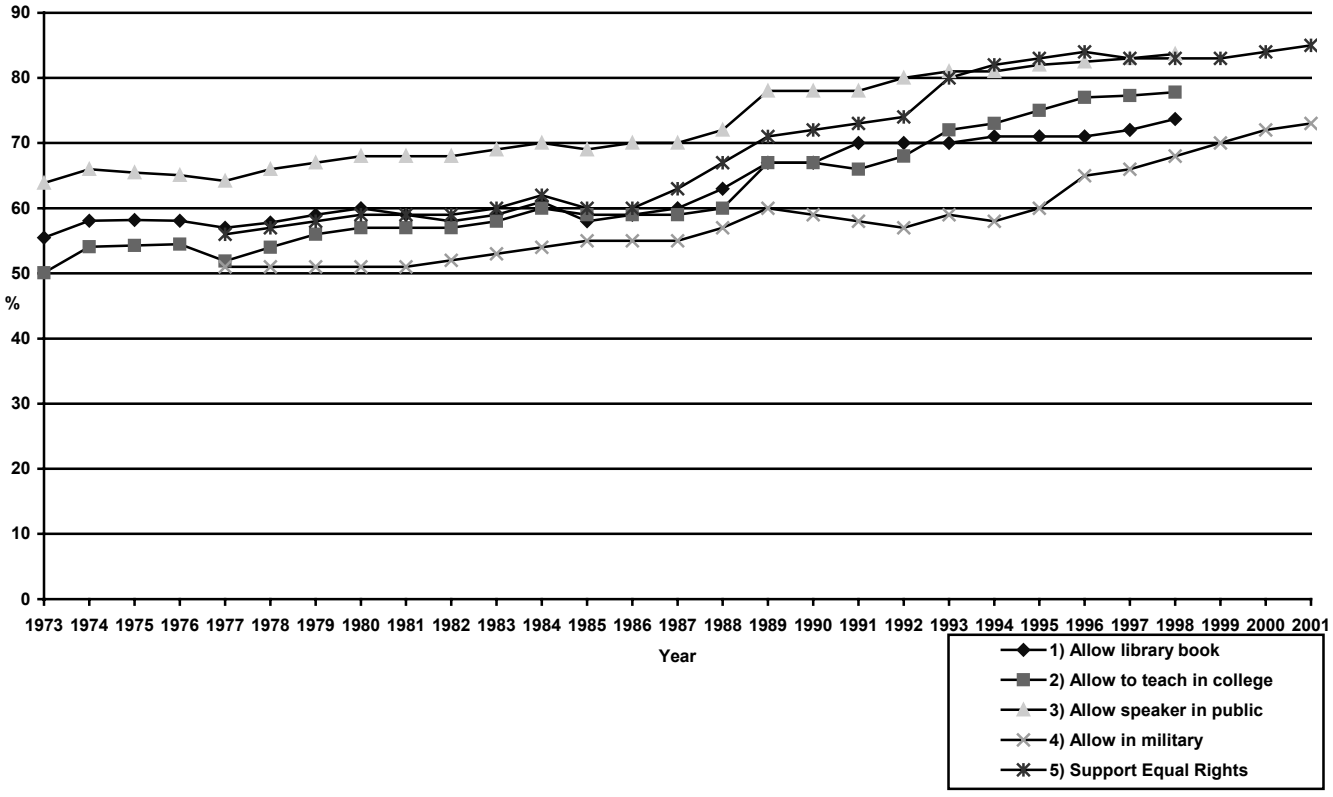
On specific questions concerning the civil rights and liberties of gays and lesbians, the public has become increasingly tolerant and supportive of legal protections against discrimination. Since the 1970s, the General Social Survey and the Gallup Poll have also asked survey questions on support for allowing homosexuals to speak in public, to teach, and to serve in the military, permitting books on homosexuality in public libraries, and for ensuring equal employment rights. The responses to each survey question are displayed in Figure 2 as the percentage of respondents supportive of gay civil rights and liberties.

Support for gay civil liberties and civil rights has increased significantly since the early 1970s, and the increase tracks well with the increasing number of government protections for homosexuals, as well as the increasing number of elected lesbian and gay officials. Moreover, these numbers correspond with the increase and growth of gay interest groups over time. Other national surveys also clearly show that large majorities of Americans now favor equal rights for gays in housing, employment, public accommodations, and credit practices. However, these same polls suggest there is weaker support for same-sex marriage, for the adoption of children by same-sex couples, and for allowing homosexuals to work in professions dealing directly with children.

Support for gay and lesbian political candidates has also been on the increase since the 1970s. The Gallup Poll has asked adults in several national surveys if they would vote for a homosexual presidential candidate. Specifically, in 1978, 1983, and 1999 Gallup asked if respondents would support their party's nominee for president if the party nominated a generally well-qualified person for president who happened to be a homosexual. In 1978, only 26 percent of respondents said yes, in 1983, 29 percent said yes, but by 1999, 59 percent said they would vote for a homosexual candidate for president.

Finally, since the 1970s, the gay rights movement has consistently argued that a major goal of the movement must be to educate the public about homosexuality. In order to accomplish this goal, gays and lesbians must be public about their sexual orientation—they must "come out." By coming out, gays and lesbians allow their friends, family, and co-workers to know a gay person, and thereby come to realize that gay people are just like everyone else. Movement activists believe this recognition leads to greater tolerance of homosexuality and support for lesbian and gay civil rights. Public opinion data support this perspective. The more gay people a person knows, the more supportive they are of homosexuality and gay civil rights and liberties, spanning issues from job protections to gay adoption and to same-sex marriage.

Figure 2. Support for Homosexual Civil Rights and Liberties, 1973 to 2001



Notes: Data compiled by the author from General Social Survey (GSS) and Gallup Poll questions asked of adults in the United States. The responses to each survey question are displayed as the percentage of respondents indicating a response supportive of gay civil rights and liberties. The questions were stated as: 1) "If some people in your community suggested that a book he wrote in favor of homosexuality should be taken out of your public library, would you favor removing this book, or not?" 2) "And what about a man who admits that he is a homosexual? Should such a person be allowed to teach in a college or university, or not?" 3) "And what about a man who admits that he is a homosexual? Suppose this admitted homosexual wanted to make a speech in your community. Should he be allowed to speak, or not?" 4) "Now I'd like to ask you about the hiring of homosexuals in specific occupations. Do you think homosexuals should or should not be hired for the following occupations: The armed forces?" 5) "As you may know, there has been considerable discussion in the news regarding the rights of homosexual men and women. In general, do you think homosexuals should or should not have equal rights in terms of job opportunities?"

Indeed, the only subgroup that has majority support for same-sex marriage is those people who know at least one gay person. One potential benefit of this phenomenon is that as more public figures and celebrities are open about their sexual orientation, the public may grow even more tolerant and supportive of gay civil rights and liberties because individuals come to see public figures as people they "know."

Referenda and the Anti–Gay Rights Movement

The gay liberation movement emerged in the late 1960s on the heels of the black civil rights and women's movements. From that time, gay groups became more aggressive in protesting discrimination. During the first half of the 1970s, the movement encountered little organized opposition and successfully lobbied for a number of legislative reforms. By 1982, twenty-five states had repealed sodomy laws prohibiting consensual sex acts conducted in private between adults. By the end of 1978, thirty-six municipalities, seven counties, and one state had enacted some form of legislation or executive order prohibiting discrimination on the basis of sexual orientation. These policies varied widely in wording and scope, but most included protection against discrimination in employment, housing, and public accommodations.

Miami Gay Rights Law

The first challenge that resulted in a referendum on a so-called gay rights law occurred in Florida in Dade County (which is coextensive with the Miami metropolitan area) in 1977. The previous year, forty-five of forty-nine candidates endorsed by a coalition of gay organizations were elected, and soon after the group began to lobby for passage of an amendment to the county antidiscrimination law to include sexual and affectional preference. Opposition formed, and the debate was quickly subverted to a discussion on the acceptability of homosexuality rather than a human rights issue. Conservative Christians, objecting on religious grounds, were the primary opponents of the ordinance. Other popular arguments against the ordinance were that children would be more exposed to homosexuality, encouraged to become homosexuals, and possibly molested. The ordinance did not apply to public schools but would have affected hiring practices in private schools.

When the ordinance passed, prominent Roman Catholic, local attorney, and sometimes public official Bob Brake arranged an initiative petition to repeal the law. An organization called Save Our Children (SOC) was formed to coordinate this effort, and singer Anita Bryant was elected president. Strong local and national media attention throughout the campaign resulted from her involvement. SOC gained most of its support from religious communities and laid plans to collect the necessary 10,000 signatures on a petition to force a referendum on the issue. Opponents also mounted legal challenges to the ordinance, which failed. The media in Miami largely opposed the ordinance. Forty-five percent of registered voters turned out for the June poll; 66 percent voted for repeal.

The SOC campaign encouraged a series of gay rights repeal efforts and other measures that occurred across the country: Later in June, U.S. Representative Edward Boland (D-MA) introduced the Stable Family Amendment, and Representative Lawrence McDonald (D-GA) introduced similar legislation designed to limit certain government services to homosexuals. In Minnesota, State Senator Florian Chmielewski praised Bryant and announced plans to introduce legislation to make sodomy a criminal offense. The Arkansas House of Representatives voted unanimously to commend Bryant and reinstated a law banning sodomy. In Florida, laws were passed prohibiting homosexuals from adopting children and same-sex marriages. In Broward County, Florida (Ft. Lauderdale), the Human Rights Advisory Board voted not to support a similar gay rights ordinance. In Austin, Texas, voters rejected a gay rights bill that the American Civil Liberties Union (ACLU) had expected to pass easily before the Miami campaign. In Dover, New Hampshire, City Councilor Arnold Peters announced that he was inspired by Bryant and proposed an ordinance banning gay school teachers. And though he later backed down, in November 1977, Nolan Estes, superintendent of the Dallas, Texas, school

system, stated that any schoolteacher identified as homosexual would be asked to resign. Conservative Christians around the nation, typified by leaders such as Jerry Falwell, became vocal in their opposition to gay rights

Extension and Repeal of Antidiscrimination Laws

In the eighteen months following the Miami repeal, Ingham County, Michigan, and six cities (Champaign, Illinois; Wichita, Kansas; Eugene, Oregon; Aspen, Colorado; San Francisco, California; and Berkeley, California) extended their antidiscrimination laws to protect gay people. New York City Mayor Ed Koch issued an executive order to this end the day after his inauguration. Two of these laws were withdrawn or repealed (Wichita and Eugene) a short time after passage. In addition, in two places, laws that had already been in existence for some time came under challenge.

In April 1978, St. Paul, Minnesota's four-year-old civil rights law amendment, which banned discrimination on the basis of sexual or affectional preference, was repealed after a referendum held in response to an initiative procedure resulting from a successful petition drive led by Richard Angwin, a Baptist minister. (In neighboring Minneapolis, a similar law that was enacted in 1974 went unchallenged.) The campaign tactics, arguments, and results were remarkably similar to the repeal in Miami a few months earlier, with both sides drawing on the experience of their Miami counterparts. The same was true of the Wichita repeal referendum, which also occurred in April and was run by a Baptist minister, Ronald Adrian, who was a friend of Angwin. The Wichita referendum repealed the gay rights law of nine months earlier.

In May 1978, a referendum was held in Eugene, Oregon, on its recently passed gay antidiscrimination ordinance. Eugene is a relatively liberal university town in a state that was a pioneer in marijuana and consensual sex law reform. Twice before 1978, Oregon had come within two votes of enacting a state antidiscrimination law protecting gay people, and so gay leaders were hopeful that the outcome of this vote would be different. Although many of the principals of the repeal effort and their supporters were religious (which may have been a major source of their objections), attempts were made to base the repeal campaign on more secular arguments—that is, there was no need for the law, and gays were a special interest group asking for special favors.

ANITA BRYANT (1940–)

Anita Bryant was a beauty queen who had several hit songs in the late 1950s. In the 1970s, Bryant was mostly known for co-hosting NBC telecasts of the Orange Bowl parade and for promoting Florida orange juice. She was featured in *People* magazine in 1976 and known to be a committed Christian. Bryant was instrumental in repealing legislation in Miami in 1977 that prohibited discrimination on the grounds of sexual or affectional preference. Shortly before the Miami legislation was introduced, Bryant's Baptist pastor, William Chapman, encouraged his congregation to become civically and politically active. Bryant endorsed her agent's wife, Ruth Shack, for a seat on the county commission. When Shack introduced the amendment adding sexual orientation as a protected category to (greater Miami) Dade County's antidiscrimination ordinance, Bryant was embarrassed and angry, and with other members of her church opposed the ordinance. A conservative Christian organization, Save Our Children (SOC), was formed to repeal the ordinance. Bryant was elected president, and her husband, Bob Green, treasurer. Bryant's involvement contributed to strong media attention in the campaign, which was essentially run by its secretary, Bob Brake, and a hired public relations consultant, Mike Thompson. The repeal effort succeeded, but these activities probably negatively affected Bryant's career. Gay rights leaders began a boycott of Florida orange juice and other products Bryant advertised. Although the boycotts did not have a major impact on sales, Bryant began to lose contracts. In 1978, Bryant and Green divorced.

The amendment to the city's antidiscrimination law was initiated by local Miami gay rights activists, Bob Basker and Bob Kunst, who were principals in the formation of the Dade County Coalition for the Humanistic Rights of Gays (DCCHRG), which was active in defending the amendment after opposition emerged. Jack Campbell, owner of the Steamworks chain of gay saunas, helped raise funds and encouraged the involvement of national gay rights leaders such as David Goodstein, then publisher of *The Advocate*, to defend the law.

Gerard Sullivan

Predictions of child molestation were also present, however, and claims were made that the issue being voted on was social approval of homosexuality. The law was presented as being the thin edge of homo-

Spurred by the civil rights movement, gay rights advocates demonstrate at the White House in 1965, demanding an end to discrimination against homosexuals. *(Kay Tobin Lahusen)*

sexual demands. Although those who supported the law put up a good campaign, consistent with the results of preceding referenda on this issue, 63 percent voted in favor of repeal. Gay rights leaders began to think that referenda results were inevitable.

Emboldened by the success of previous votes, the Save Our Moral Ethics (SOME) group organized an initiative and collected petition signatures that mandated a vote on rewriting Seattle's 1973 antidiscrimination law to leave out the sexual orientation clause and remove gay people as a protected class. In addition, the proposal included a provision to allow employers or landlords to "invoke the accusation" that an employee or tenant was homosexual as a basis for discriminating against them.

Gay rights activists were relieved by the results of the November 1978 poll when 63 percent of voters rejected it. SOME lacked leadership and failed to gain strong support. The initiative would have also tampered with the enforcement of antidiscrimination laws protecting women. By going too far in its opposition to antidiscrimination legislation and affecting the established rights of another very large group, the initiative lost support.

The same day an important referendum occurred in California. This was an escalation of previous antigay campaigns because it occurred at the state level, was initiated by an elected official, was not a reaction to legislation protecting gay people, and was positively discriminatory rather than merely repealing antidiscrimination legislation. Shortly after the Miami vote, State Senator John Briggs (R-CA) introduced legislation to ban homosexual teachers from California schools and sponsored a Senate resolution commending Bryant. When both measures failed to gain support in the legislature, Briggs organized a ballot initiative in an attempt to enact the measure into law. Briggs pulled together a coalition largely of fundamentalist Christians to support the measure, and although 2.8 million people voted for it, 58 percent of voters rejected it.

Although Briggs's initiative failed in California, it encouraged state senator Mary Helms (R-OK) to introduce similar legislation in Oklahoma. A resolution commending Bryant was passed by both houses of the legislature, and a bill very similar to Briggs's proposals became law in 1978. Helms's bill provided that school districts be permitted to refuse employment, or dismiss or suspend a teacher, student teacher, or teacher's aide who engaged in "public homosexual behavior," defined as "advocating, soliciting, imposing, encouraging or promoting public or private homosexual activity in a manner that creates a substantial risk that such conduct will come to the attention of school children or school employees." (In 1985, the U.S. Supreme Court, by tie vote, upheld a 10th Circuit Court of Appeals decision overturning the Oklahoma law.)

Repeal movements continued sporadically in subsequent years. In 1980, Christian coalitions organized referenda on ordinances banning discrimination on the basis of sexual preference in Santa Clara County and nearby San Jose, California. Both laws were repealed. In 1984, a court challenge was mounted against Mayor Ed Koch's executive order protecting gay people from discrimination. In 1985, Houston voters repealed the part of that city's antidiscrimination ordinance that included lesbian/gay people as a protected category. At the same time, legislators in

At the Statehouse in Boston on July 17, 2002, activists discuss a measure aimed at banning gay marriage. A Massachusetts court decision in November 2003 ruled that people had the right to marry members of the same sex. *(AP Wide World Photos)*

various constituencies continued to extend antidiscrimination laws to protect gay people.

1990s Repeal Movement

By 1993, eight states (California, Connecticut, Hawaii, Massachusetts, Minnesota, New Jersey, Vermont, and Wisconsin) had antidiscrimination laws, and eight more (Maryland, Michigan, New Mexico, New York, Ohio, Pennsylvania, Rhode Island, and Washington) protected gay employees in public employment; 128 cities and counties prohibited discrimination on the basis of sexual orientation (including some where they had previously been repealed by referenda); and 27 states had decriminalized sexual acts by consenting adults in private. In the long run, although conservatives won many individual battles to repeal lesbian/gay civil rights laws, they also inadvertently contributed to national organizing efforts by lesbian/gay civil rights activists.

During the early 1990s, a new wave of antigay initiatives emerged, with Christian conservatives now proposing discriminatory legislation rather than trying to repeal antidiscrimination laws. In 1992, in both Oregon and Colorado, initiatives resulted in statewide referenda aiming to reverse the tide of increasing gay rights.

In 1992, the Oregon Citizens Alliance (OCA) had placed on the November ballot a proposal to amend the state constitution to prevent the passage of any gay rights legislation. After Measure 9 did not gain enough votes to be enacted, OCA ran petitions leading to referenda in several Oregon cities and counties on a toned-down version of whether local governments should "recognize" or "promote" homosexual

rights. Voters in four counties and four cities approved this proposal before the state legislature voted to invalidate the new ordinances by passing HB3500, a bill prohibiting local governments from enacting any laws dealing with gender rights—pro or con. OCA challenged the law as unconstitutional and won a judgment that similar referenda could be held pending the outcome. Subsequently, voters in six cities and one county passed OCA-sponsored proposals, and referenda were planned for five more constituencies. OCA failed to gain adequate petition signatures to force a vote in fourteen municipalities, cities, or counties. Although OCA's successes have been limited, it remains active in pursuing an antigay agenda.

Also in November 1992, 53 percent of Colorado voters supported Amendment 2, which overturned local laws prohibiting discrimination based on sexual orientation and prevented the passage of new ones. A principal argument by adherents of the measure was that homosexuals should not have special rights. Gay activists responded by calling for a boycott of business with Colorado. The "gaycott" became controversial but was said to have cost the state millions of dollars in lost convention business and tourism. The Oregon and Colorado campaigns struck a chord among voters in many other constituencies. Organizations began work to pass similar measures in Florida, Idaho, Maine, and New Hampshire, as well as in Cincinnati and Ohio. The antigay movement was slowed by a judgment of the Colorado Supreme Court in July 1993, which upheld a lower court injunction against Amendment 2 issued in January, on the grounds that it was probably unconstitutional. This allowed antidiscrimination laws in Aspen, Boulder, and Denver to remain in force.

Supreme Court Ruling

The constitutionality of Amendment 2 was appealed to the U.S. Supreme Court, which ruled 6 to 3 on October 10, 1995, against Amendment 2 in the case of *Romer v. Evans* on the grounds that it contravened the equal protection clause of the Fourteenth Amendment of the Constitution. The ruling was important because it undermined the "gay rights are special rights" rhetoric of those opposed to antidiscrimination rights on the basis of sexual orientation and has been used to end antigay legislation proposed in Alachua County, Florida, as well as a gay harassment case brought against a school district in Wisconsin and a parental visitation case in Illinois. However, the U.S. Supreme Court judgment in *Romer v. Evans* made no reference to the earlier U.S. Supreme Court decision upholding Georgia's sodomy law in the case of *Bowers v. Hardwick* (1986), nor did it address the key equal protection issue of whether "sexual orientation" is a suspect or quasi-suspect classification analogous to race or sex. Thus, it left the legal status of lesbians and gay men somewhat uncertain. The culture war between gay rights advocates and opponents continues, with gay rights advances most successful at the local level.

Bisexual Movement: A Brief History

In the contemporary world of gay-versus-straight, bisexuals who are out and open about their identity present a confounding middle ground. Out bi women and men also have more than one closet to free themselves from; they cannot pass as heterosexual *or* homosexual. Ridiculed and questioned for who they are, out bisexuals often encounter distortions, disbelief, and hostility from gay and straight people alike.

Bisexuality Explained

What is so threatening? The open, sociopolitical assertion of bisexual identity refutes the assertion that sexual orientation is binary. When someone comes out as bisexual, he or she raises different issues. Coming out gay is more and more commonly perceived as a *reversed* orientation; that is, this person is oriented toward her or his *own* sex, not the *opposite* one. But coming out bisexual calls the categories themselves into question—not only the categories of sexual orientation but of gender as well. Both identities are based, at least at present, on seeing heterosexuality as the default and its prescribed gender roles as norms.

An openness to emotional, romantic, and/or physical relating that is not confined to either one's own or another sex challenges both homosexual and heterosexual identity. One of the greatest challenges in publicly expressing, and thus politicizing, bisexual identity has been making bisexuals visible in this either/or world.

Bisexuals have been part of, and apart from, the lesbian and gay rights and liberation movement since its origin, but they have not often been visible *as bisexuals* in these groups. Indeed, in the early phases of the gay liberation movement during the late 1960s and early 1970s, several bisexual activists contributed to "gay liberation" without feeling any need to insist on a separate bisexual identity. Many bisexual women activists saw political value in calling themselves lesbians to undermine the antifeminist practice of lesbian baiting.

Consider these little-known historical facts:

- An out bisexual man founded the first student homophile group at New York University in 1971 and went on to become an organizer against prison rape before he died of AIDS in the 1990s.
- An out bisexual was one of the first women to write about loving women in the national feminist news journal *off our backs* in 1972.
- An out bisexual man was one of the key organizers of the first ever gay people of color conference, the National Third World Lesbian and Gay Conference, which was associated with the national March on Washington for Lesbian and Gay Rights in 1979. He also co-founded the National Coalition of Black Lesbians and Gays and led the first delegation of black gays to meet with President Jimmy Carter's White House staff.
- It was an out bisexual man who conceived and spearheaded the successful national "gaycott" of Florida orange juice in response to Anita Bryant's homophobic Save Our Children campaign in Dade County, Florida, in the late 1970s.
- An out lesbian-identified bisexual mom ran for vice president on a bisexual/lesbian/gay civil rights platform during the 1984 Democratic Party convention.
- An out bisexual AIDS educator and therapist, one of the first innovators of safer sex teaching methods in the early 1980s, actively lobbied the San Francisco Department of Public Health to recognize bisexual men in official city AIDS statistics, thus setting the standard for health departments nationwide, which previously had recognized only gay men,
- In May 1989, an out bisexual veteran from New England, representing the National Gay, Lesbian

Marchers for sexual freedom parade in the Christopher Street Liberation Day celebration in New York City in June 1971. *(Kay Tobin Lahusen)*

and Bisexual Veterans Association, was the first veteran ever invited to testify before Congress on behalf of all lesbian, gay, and bisexual veterans. He pointed out, rightly, that you can be discharged from military service for being bisexual as well as homosexual.

Bisexual Organizing Strategy

Bisexuals often were, and are still, perceived as gays and lesbians by the media, society, and the LGBT movement. So bisexuals have realized the necessity of a dual strategy: (1) organizing a separate bisexual movement and (2) continuing to work in coalition within the lesbian and gay movements and other movements for sexual and gender liberation. How did the coordinated efforts of lesbians, gay men, bisexuals, and transgender people eventually become called the LGBT Civil Rights Movement? How did the "B" get in LGBT?

Early Gay Liberation Front slogans, such as "Gay is what we make it," used *gay* to mean all people who celebrate their same-sex attractions and feelings. *The Gay Manifesto*, frequently circulated in the early 1970s, stated: "The reason so few of us are bisexual is because society made such a big stink about homosexuality that we got forced into seeing ourselves as either straight or non-straight. . . . We'll be gay until everyone has forgotten that it's an issue. Then we'll begin to be complete people."

Only later, as gay and straight "sides" polarized, did the bisexual middle zone become "no man's, or woman's, land." The gay liberation movement during the mid-1970s changed from a culture-wide sexual liberation movement into a less militant, more reform-oriented mobilization for gay civil rights. In the

mid-1970s, the American Psychiatric Association and the American Psychological Association began declassifying homosexuality as a mental illness. Bisexual therapists were active in making sure that bisexuality was also written into the guidelines that the associations developed to promote positive approaches to sexual minorities. However, it took until 1997 to make the language of the American Psychological Association's guidelines fully inclusive of bisexuals.

When mental health professionals began declaring same-sex loving no longer a sickness, conservatives countered by calling it a sin, accusing gays, and bisexuals especially, of willfully choosing how they loved. Unfortunately, at this point gay legal strategists ceded ground on the freedom-of-choice basis, asserting that gays were "born that way" and could not change even if they wanted to, thus equating gayness with ethnicity and arguing that homosexuality was a "protected class." (Bisexuals were not considered part of the class or even a legitimate group under discussion.) This isolated bisexuals and eliminated the possibility of defining bisexuality as an equally valid orientation. Gay lawyers have yet to argue that same-sex love can also be a choice and, like religion, deserves defense on that ground.

AIDS, Bisexuality, and Activism

The AIDS pandemic helped mobilize the already growing bisexual movement when the federal government's Centers for Disease Control (CDC) labeled bisexuals as a major risk group, as a vector for HIV disease to enter the "general population." *Newsweek* and other major news media branded bisexuals social "pariahs." This scapegoating, combined with the fact that many bisexuals were already infected, dead, or dying of AIDS, increased bi militancy and catalyzed bi pride. During the mid-1980s, two other factors fertilized the ground upon which the modern U.S. bi movement was born: (1) a new generation of young people with more fluid identities became active in helping found campus gay, lesbian, bisexual (and sometimes transgender) groups and started demanding bi inclusion in the names and programs of these groups, and (2) a new generation of bi women—who had gained leadership in feminist groups, gay and lesbian groups, and other organizing efforts for social justice—began to apply their organizing theory and practice to their political/sexual orientation identity as well. By 1990, the first U.S. academic course on bisexuality was offered at the University of California/Berkeley. While still rare, courses on bisexuality are offered at several other universities today.

Although there had been individual "out" bisexual activists and local support and political groups organizing since the 1970s and 1980s, the first time bisexuals came together nationally was as a contingent of seventy-five bisexual activists from around the country who marched together in the 1987 March on Washington for Gay and Lesbian Rights. Not coincidentally, this was also the first time the Names Project/AIDS Quilt—an artistic homage to those who died—came to Washington. Many bisexuals who had already died in the epidemic were represented by quilt squares on the Mall, while their surviving family members, lovers, and friends marched down Pennsylvania Avenue in mourning and in rage. Networking from that 1987 contingent helped create the first National Bisexual Conference in June 1990 in San Francisco, planned to coincide with the International AIDS conference and the Lesbian and Gay Pride Day Parade. San Francisco's Board of Supervisors proclaimed a citywide "Bisexual Pride Day," and plans were laid for the national organization that was later to become BiNet USA.

BiNet USA organizers met again in Seattle in 1991, and in Minneapolis in 1992, to create a national and regional structure, elect national coordinators, and begin publishing a national newsletter. Bi activists also began providing staff training and board presentations to national gay and lesbian organizations to help educate them about bisexual issues and bisexual identity at this time. Most significantly, a regional alliance of bisexual activists and groups, the East Coast Bisexual Network, worked with Boston-area bi activists to form the Bisexual Resource Center (BRC). The BRC established a bi archives in Boston and publishes educational brochures and materials.

Bisexuals in the LGBT Movement

By the early 1990s, the term *LGBT* (sometimes *GLBT*) was beginning to catch on, especially on campuses and among younger people who tended to identify more as queer. Many bisexually identified activists were actively involved in organizing for the 1993 March on Washington for Lesbian, Gay, and Bi Equal Rights and Liberation. They lobbied successfully to get "bi" placed in the official title of the march, which represented a tremendous victory. And, for the very first time, an out bi speaker was chosen to speak on the main stage at the afternoon rally. BiNet USA, the Bisexual Resource Center of Boston, and AMBi—a local Washington, D.C., bi political action group—all cosponsored a national Conference Celebrating Bi-

sexuality and Bi Dance in Washington, D.C., that weekend.

The right wing's 1991 inclusion of bisexuals in the language of Colorado's antigay Amendment Two, which was soon copied in the early 1990s by many other states, inadvertently helped bisexuals educate resistant gay and heterosexual supporters. Using the slogans "Our enemy recognizes us, why don't you?" and "Don't let them divide us, we're all in this together," bisexuals mobilized in many states to fight homophobic and biphobic ballot measures. A notorious memo from the National Legal Foundation, which became Plaintiff's Exhibit 18-92 CV7223 in the legal challenge to Amendment Two, and subtitled "Re: Analysis of Language in Amendment Initiative," was called, by bi organizers, "The Smoking Gun Memo" because it exposed the right wing's strategy of including *bisexual* as well as lesbian and homosexual in the amendment language. The memo's stated rationale was that ". . . many persons who engage in same sex relations attempt to make their homosexual behavior appear more 'normal' or legitimate by saying that they also engage in heterosexual relations. From a moral standpoint of course homosexuality and bisexuality are indistinguishable."

Backlash Against Bisexuals and Transgendered People

In 1994, the right-wing backlash specifically aimed at bisexuals and transgendered people occurred in Minnesota. Norm Coleman, then mayor of St. Paul (and later elected senator from Minnesota in 2002), refused to sign a city proclamation declaring June as the month of the Gay, Lesbian, Bisexual and Transgender Pride Celebration. He said that though he supported human rights for gays and lesbians, he saw "no public purpose in promoting bisexual or transgender pride." Coleman used the protected class argument in his defense, asserting that gays and lesbians have legal status because of their sexual orientation, but that bis and trans didn't.

In 1995, BiNet USA developed a national media packet of informational materials that helped generate a ground-breaking *Newsweek* cover story on bisexuality. BiNet also established a Bisexual Youth Initiative that surveyed all U.S. organizations serving LGBT youth and then gave them the survey results in report form so that it could be used to help them improve their services to bisexual youth. Bisexual activists worked locally and nationally throughout the 1990s to increase bi visibility and gay, lesbian, and transgender understanding of bi issues at local, regional, and national conferences of organizations such as the National Youth Advocacy Coalition; GenderPAC; the Gay and Lesbian Alliance Against Defamation; the National Black Lesbian & Gay Leadership Forum; the National Latina/o Lesbian, Gay, Bisexual and Transgender Organization (LLEGO); Parents, Friends and Families of Lesbians and Gays; the Gay, Lesbian and Straight Teachers and Educators Network, and, most actively with the National Gay and Lesbian Task Force's popular annual activist/organizer training ground—the Creating Change Conference. In 1992, bisexual activists had instituted the tradition of same-sex Women's, and Men's, Dialogues at Creating Change. These dialogues began as an effort to help bisexual women and lesbians talk with each other as women and to help gay men and bi men communicate with each other as well. Several years into the experience, however, it was clear that transgender women and men also needed to be included in the women's and men's dialogues. When transgender women and men joined these Creating Change dialogues in the mid-1990s, the discourse quickly expanded beyond orientation politics to include complexities of gender identity as well.

At the 1996 Creating Change in Alexandria, Virginia, bisexual and transgender activists staged a confrontational yet peaceful Bi/Trans Action. The activists requested time during a plenary assembly when thousands of people were gathered in the auditorium together, to speak out about specific incidents of biphobia and transphobia experienced during the gathering. They called on everyone in the auditorium who was bi, trans, and/or intersexed (one whose reproductive and sexual anatomy does not conform to standard expectations about "male" and "female") to come forward to the front of the room. As one-quarter to one-third of the room came forward to face the audience, the visual, visceral impact of a truly LG AND BT community became evident and real.

The bi, trans, and intersexed spokespeople then asked those left sitting in the audience who had ever spoken up as allies to bisexual, transgender, and intersexed people in their organizations and in their communities to stand up in their rows. A large majority of the audience did. Lastly, they asked those who remained seated who had not done so yet, but now resolved to in the future, to stand. Very few were left sitting as the action dissolved into cheers and applause. During this conference week, bi/trans activists

also met with the White House LGBT liaison for the first time ever.

In 1996, NGLTF organized a roundtable entitled "Strategizing Change: A Roundtable on Law and Social Science," the largest and most influential council of LGBT organizations, and invited BiNet USA to join. The roundtable includes national lesbian, gay, and transgender groups such as NGLTF, the National Center for Lesbian Rights, Gender PAC, FTM International, Inc., the Human Rights Campaign, LLEGO, and Children of Lesbians and Gays Everywhere. During this period, BiNet also organized a national Allies Campaign where gay, lesbian, transgender, and other progressive organizations supportive of sexual orientation rights issues were asked to sign on as advocates of bisexual rights and to contribute to BiNet. The next year Harvard University hosted the Fifth International Conference on Bisexuality. Organized by the Bisexual Resource Center of Boston, the conference was attended by more than 900 people from twenty countries.

In 1998, bisexual activists responded to a call to counter the Religious Right's "Ex-Gay" Movement by mobilizing a major media campaign whose centerpiece was a poster featuring candid photographs of a wide variety of bisexual people and text meant to imitate recent full-page ads placed by fundamentalist conservatives in major newspapers that advocated "changing people back to straight." The effort was also designed to counter or supplement response ads that the Human Rights Campaign and PFLAG had developed, which spoke only for the most conformist, born-that-way elements of the gay community. Unlike these campaigns, in which bisexuals were invisible, the bisexual poster's text made clear that bisexuals are some of the people most easily and often harmed by such moral judgments and manipulations, since they do have attractions for different sexes. Imitating yet reversing the hate-filled language of the original poster, this bi response piece proclaimed, "The Truth Is, All of Us—Bisexual, Lesbian, Gay, Transgender, Heterosexual—Deserve the Right to Love Whom We Choose." The bi poster campaign was backed by the national bi magazine *Anything That Moves*, in conjunction with BiPOL San Francisco, the Bisexual Resource Center, and BiNet USA. It enlisted the bulk of LGBT organizations in the country for the first time (all but HRC, which didn't respond) in publicly endorsing an educational campaign designed to highlight bisexual people's rights and their vulnerabilities under right-wing attack.

In 1998, organizers of a proposed Millennium March on Washington solicited support from the U.S. bisexual movement. The movement, represented by BiNet USA, was one of the earliest national groups and the most united in raising questions about the flawed structure and strategy of the march for the next two years. National bisexual activists became active in the Ad Hoc Committee for an Open Process, the coalition of LGBT groups that questioned the march's top-down planning process. At a national meeting in November 1998, BiNet USA delegates unanimously passed a resolution to withhold endorsement of the march, to use HRC's and the Metropolitan Community Church's pushing of the march "as a teaching tool about how BiNet USA does grassroots organizing differently," and "to continue participating in the Ad Hoc Committee's critique, which is developing a larger, progressive LGBT agenda for our movement beyond the March." This resolution was also made into a flyer and widely distributed at that month's Creating Change in Pittsburgh.

In 1999, bisexual activists continued to work in local, state, and national coalition with lesbian, gay, and transgender activists through NGLTF's state-by-state Equality Begins At Home rallies, bringing bisexual issues to these forums. In 2001, BiNet USA reorganized its board, held a series of fund-raising house parties around the country, and opened a national office with its first paid staff person. Unfortunately, that effort did not succeed more than a year, but individual bi activists continue to work with other bi groups such as the Bisexual Resource Center and as out bi activists in many local and national LGBT organizations as well. Haworth Press, which has long published *The Journal of Homosexuality*, began publishing a *Journal of Bisexuality* in the new millennium. In 2002, bisexual leaders and the NGLTF Policy Institute began work on a publication on policy issues and bisexuality.

Conclusion

Some lesbian and gay political theorists still argue that there are no "bisexual issues," that all questions of bisexual rights are subsumed under lesbian and gay rights, and that bisexuals will be automatically liberated and accepted fully once lesbian/gay rights are won. In objection to this oversimplification, the emerging bisexual politic asserts that there are specifically bisexual issues and that they are integrally related to gay liberation and sexual liberation as a whole. One example: notice that same-sex marriage is a more accurate term than gay marriage. Bisexuals often partner with someone of their own sex while re-

taining their bisexual orientation. Their union is a same-sex one, not a gay marriage. One's bisexual orientation does not change according to the sex of one's partner(s). Identity is separate from the relationship(s). Another example is that bisexuals, although they share many issues of discrimination concerning their same-sex relationships with lesbians and gay men, are also sometimes discriminated against because they ARE bisexual—because they upset the dichotomies and refuse to choose sides in a world that is polarized with respect to both gender and sexual orientation. Hatred against bisexuals is also often disguised as generalized sex-phobia. Bisexuals are often the target of nonbisexuals' erotic fantasies and projections. During the title debate for the 1993 March on Washington, for instance, there was a very firm, majority view, that the words "gay" and "lesbian" could appear in the title but that the full word "bisexual" could not because it was "too sexual." It was suggested that bisexuals be included as just "Bi's." Bi organizers agreed to this compromise, and their orientation was included in the title of a national gay march for the first time in history.

Out bisexuals in the year 2002 are active in many LGBT and progressive causes and organizations. They continue to integrate bi issues into larger efforts for social justice and sexual liberation. There are now bisexual Internet chat rooms, a bisexual summer camp in New England, an annual national bi men's gathering in Southern California, a newly organized bisexual charitable foundation, and regular international bi conferences in Europe, Canada, Australia, and elsewhere in which many U.S. bisexuals participate. But the next steps of political organizing among U.S. bis, and between U.S. bis and other sectors of the U.S. LGBT movement, remain unclear. A number of first-wave U.S. bi activists have now diminished their activism or gone on to organize in other arenas, as out bisexuals focused on issues such as labor, the environment, or women's health. A new generation of young people now identifies more as queer and less as L, G, B, or T. They will probably write the next chapter in a way no one has yet conceived of.

AIDS Coalition to Unleash Power: The ACT UP Movement

Early Responses to the AIDS Crisis

Acquired immune deficiency syndrome (AIDS) was first identified in the United States in August 1981 when doctors noted a "rare cancer" among gay men in New York, Los Angeles, and San Francisco. Within the gay community, initial reactions included rumor and fear, sentiments fostered by a lack of medical knowledge about the new disease. Except for a small number of sympathetic scientists and physicians, the healthcare industry and the federal government ignored the epidemic as it emerged among gay men in the United States and Western Europe in the early 1980s. A wide range of organizations responded to this lack of knowledge and action in the early and mid-1980s. Most were based in the large cities where gay neighborhoods had developed in the 1970s. Staffed overwhelmingly by gay men, these groups focused on care, treatment, and emotional support for people with AIDS (PWAs) and their friends. The earliest was the Gay Men's Health Crisis, founded in New York City in 1982; other umbrella organizations included the San Francisco AIDS Foundation, Boston's AIDS Action Committee, and AIDS Project-Los Angeles. Groups like God's Love We Deliver (New York), Food and Friends (Washington), and Project Open Hand (San Francisco) delivered meals to homebound people with AIDS; San Francisco's Shanti and the Coming Home Hospice focused on care for the dying; the Names Project began work on the AIDS Memorial Quilt in San Francisco in 1987.

In later years, activists criticized these early responses to AIDS for not being more aggressively political. Yet these were difficult times in which to build a social movement: leading political organizers from the gay rights movement of the 1970s were lost to the disease, very little medical information was available, the medical establishment remained hostile to people with AIDS, and twenty states considered legislation in the 1980s that would have quarantined or tattooed people with AIDS or otherwise curtailed the civil liberties of gay men and people with AIDS. Considered in this context, the service work of early AIDS organizations—and the political work of existing gay and lesbian organizations on behalf of people with HIV and AIDS—appears more significant. These efforts required courage in the face of medical uncertainty and achieved defensive victories that prevented the implementation of even more drastic measures at a time of severe stigma and discrimination.

The Emergence of ACT UP

By the mid- to late 1980s, many had grown impatient with existing responses to AIDS. Some gay and lesbian activists, many living with HIV or AIDS or confronting society's resurgent homophobia, formed a new organization in March 1987: the AIDS Coalition to Unleash Power, often known by its acronym, ACT UP. Activists were angered by the slow pace of government action and frustrated by lesbian and gay rights organizations that they felt paid too little attention to the AIDS crisis. Many also criticized the social service orientation of existing AIDS groups and hoped a new organization could focus specifically on political action. ACT UP's origins are often traced to a March 10, 1987, speech by AIDS activist Larry Kramer at the New York City Lesbian and Gay Community Services Center, in which Kramer denounced the apathy and inaction of gay men in the face of the AIDS crisis and warned that two-thirds of the audience would be dead within five years unless they took more active steps to stop AIDS. In fact, while Kramer's speech was a key prompt for organizing ACT UP, many AIDS activists had by this time already begun to focus on direct political responses to the crisis. Sit-ins and civil disobedience had taken place regularly in San Francisco, including a vigil that started in October 1985 and would continue for nearly ten years;

ACT UP ORIGINAL WORKING DOCUMENT (1987)

ACT UP, founded in New York in 1987, is a direct action organization structured on the principles of ending the AIDS crisis. To draw public attention to the dire need for greater funding for treatment and cures, ACT UP engaged in civil disobedience actions in New York and throughout the country. What follows is the justification and structure envisioned for the organization's coordinating committee.

Proposal to Create a Coordinating Committee

Purpose

To create a coordinating committee which would streamline the administrative functioning of ACT UP without usurping the power and energy residing in the body as a whole.

Why we need a Coordinating Committee?

In the weeks since its creation, ACT UP has had considerable victories. We have focused the media's attention on the drug development bottleneck which exists within our government and on the greed of Burroughs Wellcome. We have shown governmental agencies that we are watching: they will be held accountable. And we have brought new energy and hope to the lesbian/gay community.

We can do much, much more. With planning, we'll have 600 angry people at our next demonstration, not 300, and the demonstration after that will have 1,200 people. As our numbers grow, our power will grow. We can continue to shed light on the drug situation and bring new insight to AIDS education, insurance discrimination, and other aspects of the AIDS crisis.

But to accomplish these goals—to continue to grow—we need more structure. We need to know who is authorized to make decisions in a crisis, who can spend money between meetings, and we need to ensure, on a day-to-day basis, that fundraising, outreach, publicity and other increasingly important tasks are handled consistently.

Each of us became involved with ACT UP because of frustration and anger with the U.S. government and its lack of interest and leadership in the AIDS crisis. We can't afford to squander the energy we've developed. But we will if we allow ourselves to become bogged down by details at weekly meetings. We need to trust ourselves enough to give up some administrative authority to permanent standing committees which will be better equipped to handle these details. . . .

Who will be on the Coordinating Committee?

The committee will consist of the following people:

A. One representative of the following five committees. Each committee will select its own representative to the coordinating committee. Alternates should also be selected to attend coordinating committee meetings if the regular representative can't attend.

Outreach: committee works on increasing the diversity of our organization involving people of color, women, and others affected by AIDS. Ensures that these groups' concerns are discussed at meetings.

Logistics: committee publicizes demos, interacts with police and works with outreach committee to ensure that demos are attended by all interested parties. Activates the phone tree.

Issues: committee researches and reviews our demands. Keeps in contact with health care providers and policy makers to keep abreast of new developments.

Media: committee ensures consistent and accurate coverage of our events.

Fundraising: committee coordinates all fundraising activities.

B. The following four people would be selected by the group as a whole:

Secretary: keeps the minutes. Makes sure our phone and mailing lists are up to date. Serves as historian.

Treasurer: Keeps all financial information. Signs checks. . . .

Time for Proposal

May 4. Proposal accepted by ACT UP. The five committees arrange to meet within the next two weeks and select their representatives and alternates.

May 18. The At-large members are elected at general meeting. Representatives of the five committees should be selected. Coordinating Committee arranges to meeting within next week.

May 25. Coordinating Committee gives its first report to the general body.

What is the Coordinating Committee not authorized to do?

Examples of some of the things the committee would not do are:

A. **Elect officers**. There will not be a President, Chair, or other executive in charge.

B. **Decide Policy**. All general policies will be decided by the body as a whole. The Coordinating Committee will ensure that policies are developed if needed, but will not have the power to adopt them for the group as a whole.

Amended version, May 4, 1987

a group calling itself the Lavender Hill Mob had engaged in direct action tactics in the winter of 1986 and 1987; and the People with AIDS Coalition's Community Research Initiative had already begun work on grassroots PWA-led drug testing initiatives.

Activists met regularly at the Community Center in New York following the speech. Only at their third meeting did they act on Steen Borher's suggestion to name the group ACT UP, and chose Avram Finkelstein's striking "Silence = Death" symbol as their logo. The organization's first public demonstration followed soon thereafter. On March 24, 1987, some 250 protesters chained themselves to the balcony of the New York Stock Exchange to protest the profiteering of Burroughs-Wellcome, a pharmaceutical company that marketed AZT (then the only AIDS treatment drug available) at the prohibitive price of $10,000 a year. Seventeen were arrested. ACT UP continued its protests throughout 1987, including its first demonstration in Washington, held in front of the White House in June 1987. In October of that year, ACT UP members participated in the March on Washington for Lesbian and Gay Rights, the nation's largest such demonstration to date.

ACT UP grew at an astonishingly rapid pace. Within two years, chapters had formed in over sixty cities across the United States and around the world. The group's membership is difficult to estimate: ACT UP maintained a highly fluid and decentralized structure that made formal membership irrelevant to the everyday workings of the group, and many more participated in ACT UP than ever formally joined it. By the end of 1988, ACT UP/New York (the largest chapter) had a budget of $300,000, counted 150 members at its weekly meetings, and could rely on several hundred or a few thousand to turn out for its demonstrations.

ACT UP's confrontational political tactics contrasted with its relatively moderate goals. The group sought to expand access to drug treatments, to achieve legal and political protections for people with HIV and AIDS, and to battle discrimination and fear of AIDS and homosexuality. What made ACT UP unique was the use of radical methods to achieve these goals. The group's tactics reflected its members' diverse experiences in the political process. Many came to the movement with experience in the social movements of the 1960s and 1970s and considered their work in ACT UP as a continuation of the radical aims of the early gay liberation movement. Through their cultural protest work, members of ACT UP challenged cultural assumptions about AIDS and about gay men through carefully staged actions that at times exaggerated cultural stereotypes or displayed positive and defiant images of gay sexuality. Protest marches, drawing on Gay Pride parade traditions, were often both angry and festive. Other highly visible methods included "zaps," which targeted a particular organization or individual, and the group's trademark "die-ins," which drew from traditions of 1960s guerrilla theater and frequently blended protest and theatricality. When the United States Civil Rights Commission held hearings in 1988 on the right to discriminate against people with AIDS, members of ACT UP engaged in silent protest while wearing clown masks. Other initiatives blended direct action street protest techniques with media savvy approaches staged to court controversy and maximize press coverage. When Chicago's Cook County Hospital refused in 1990 to treat a woman with AIDS because it had no women's AIDS ward, ACT UP/Chicago activists set up a makeshift ward on the street outside the hospital to draw attention and force quick action by hospital administrators. The new ward opened two days later.

Probably the group's most visible action, the "Stop the Church" protest at St. Patrick's Cathedral in New York City on December 10, 1989, gathered more than 4,500 activists to protest the antigay and antiabortion views of New York's Cardinal John O'Connor. Most protesters stood outside the church, but some entered the church and engaged in a "die-in" during the service. In a highly controversial action (which was neither planned nor supported by ACT UP), two participants in the Mass destroyed the Eucharist during communion service. Over a hundred were arrested.

These tactics, which addressed issues of institutional politics while simultaneously confronting the power of cultural symbolism, have been characterized by scholars as part of the broader trend among late twentieth-century "new social movements." Similar debates concern the distinction between ACT UP's tactics, which appear quite radical, and its political goals, which some have characterized as quite conservative. The visibility of the group's more dramatic protests drew attention in both the mass media and the gay press, and many in ACT UP hoped their work would radically transform the nation's political and cultural institutions, but the organization's agenda also included working within government institutions and the healthcare industry. In this sense, ACT UP continued the efforts of earlier AIDS organizations like Gay Men's Health Crisis (GMHC), drawing on and developing its substantial connections to govern-

mental and health bureaucracies. But unlike their counterparts in GMHC, ACT UP members were generally more willing to employ direct action tactics when confronted with political obstacles that could not be overcome through patient petitioning.

The complex interplay of ACT UP's tactics and goals demonstrates the simultaneously "inside" and "outside" nature of the movement. Some scholars have noted that many members of ACT UP, particularly the middle-class white gay men who made up its core constituency in its early years, joined in radical political action only after their HIV-positive diagnoses mobilized them politically. Acting with a faith that the political system could be made to work for them and that their middle-class resources could acquire AIDS treatments if they were developed more quickly, some members of ACT UP may have been politicized by their frustration at no longer being able to work the system from within. Other scholars have pointed out that many in ACT UP, especially those members who were not HIV-positive, saw their AIDS activism as part of a multivocal response to sexism, racism, and homophobia. Only their outsider status as gay men in a homophobic society allowed them insight into the connections among society's multiple forms of discriminations. In fact, the dichotomy is overdrawn. People joined ACT UP for a wide variety of reasons and brought with them a wide array of experiences and assumptions. On one level, the group's multiple approaches and sometimes conflicting styles only reflected the diversity of its members. Yet on a deeper level, this combination of insider and outsider status was one of the organization's strengths, allowing some members to deploy their social positions in the most politically effective manner in a given situation. The organization's politics cannot easily be boxed in to a single interpretation.

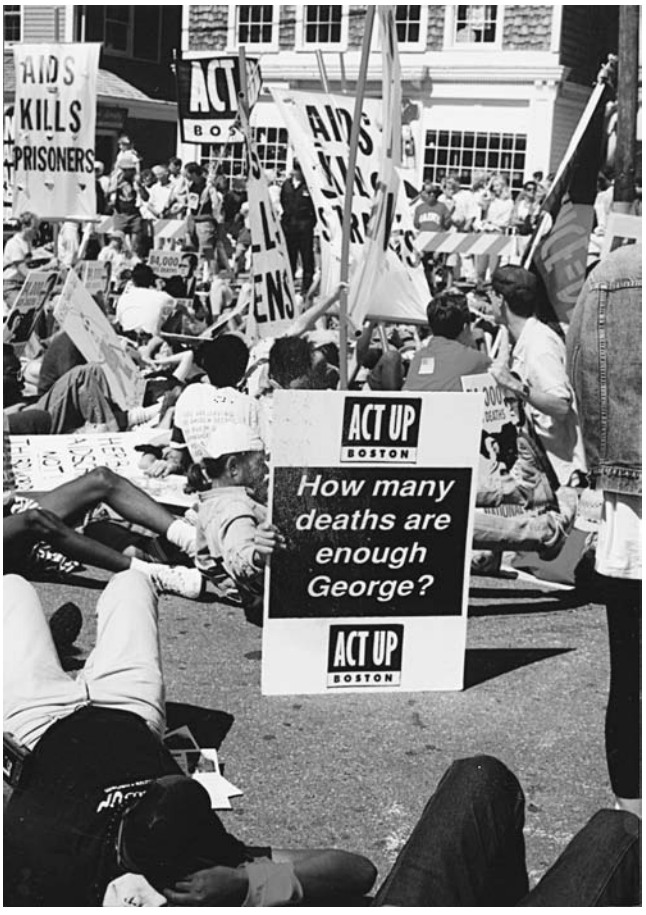
Assessing the Impact of ACT UP

ACT UP had many victories. Its first protest at the New York Stock Exchange contributed to media pressure that pushed down the price of AZT significantly. Civil disobedience and political petitioning combined to change laws, as when the success of ACT UP's clandestine needle exchange programs to protect intravenous drug users prompted many states and localities to liberalize laws regulating the dispensing of syringes. The group's single most important and direct achievement was the reformulation of drug approval procedures by the United States Food and Drug Administration (FDA). Beginning in 1989, ACT UP proposed what it called "parallel track testing" in which people with advanced cases of AIDS could participate in promising drug trials from which bureaucratic red tape had previously excluded them. Under pressure from protesters who established international AIDS drug-smuggling operations, the FDA likewise relented on an earlier policy and allowed people with "life-threatening illnesses" to import unapproved drugs for personal use. Members fought for and won the right for people with AIDS to have a say in the formation of research, development, and testing regimes; ACT UP members, most without formal medical training, frequently played prominent roles in the research community.

Some of ACT UP's activities contributed to long-term social changes of the 1980s and 1990s. Their grassroots healthcare activism opened doors for later activists on issues such as breast cancer research. ACT UP's challenge to the medical establishment's monopoly on knowledge and expertise also gave support to a growing interest in the late twentieth century in alternative medicine and natural remedies, which some ACT UP members explored as alternatives to costly and toxic drug treatments. In addition, AIDS activists in ACT UP and other groups dealing with death and dying also contributed to an emerging movement within American culture in support of a right to die for people with terminal illnesses.

ACT UP met with significant opposition from the social institutions that it targeted, from the government, and from within the gay community out of which it grew. ACT UP members experienced police brutality and harassment, including violence at the 1992 Republican National Convention in Houston and unnecessary and unconstitutional strip searches of protesters arrested during demonstrations in New York City and Portland, Oregon. Government harassment could also be more systematic. Freedom of Information Act requests have revealed that ACT UP was investigated by the Federal Bureau of Investigation's "domestic terrorism" and "civil unrest" arms as early as 1987; police in Philadelphia infiltrated the group's branch in that city.

Beyond this harassment, ACT UP also had to face the opposition of those who disagreed with its radical tactics. President George H.W. Bush, whose summer home in Kennebunkport, Maine, was the target of ACT UP in September 1991, called the work of ACT UP an "excess of free speech" and was one of many who argued that demonstrations like those at St. Patrick's Cathedral "set back the cause." The group's rush-hour sit-in that stopped traffic on the Golden Gate Bridge in San Francisco raised the ire of morning



ACT UP members demonstrate near President George H.W. Bush's summer home in Kennebunkport, Maine. *(Liz Highleyman)*

commuters and prompted a flare of anti–ACT UP coverage in the local press. Actions such as these led many, both within the gay community and outside it, to believe that the organization's confrontational style created as many enemies as friends and that its deployment of gay stereotypes and its explicit sexuality alienated many potential allies or confirmed their negative views of homosexuality. Representative Barney Frank (D-MA), an openly gay member of Congress, called the group's demonstration at St. Patrick's Cathedral "wrong and stupid," and throughout the late 1980s and early 1990s, the gay press bristled with heated debates about the implications of ACT UP. By contrast, some have suggested that the group's methods were essential to combat popular understandings: by fighting back, vocally and publicly, ACT UP challenged the labeling of people with AIDS as "victims." Another interpretation suggests that the radical tactics of ACT UP made the moderate approach of groups like Gay Men's Health Crisis more palatable to some people. In retrospect, ACT UP's radical tactics surely alienated many straight Americans, while at the same time doing much to mobilize and empower people within the gay community.

The movement was also torn apart by divisions within the organization over issues of race, gender, and class. As the demographics of the disease changed in the late 1980s and early 1990s, cases among women and people of color skyrocketed while infection rates among gay men remained steady. Women participated in ACT UP from the outset. ACT UP's women activists played a crucial role in publicizing the devastating effects of AIDS on women at a time when most Americans thought of AIDS as a disease that affected solely gay men. The primary manifestations of AIDS differ in the bodies of men and women; in the early years of the epidemic, most women were diagnosed with AIDS only after their deaths, prompting ACT UP's famous slogan "Women don't get AIDS. They just die from it." The group challenged the federal government's Centers for Disease Control to redefine the methods by which it measured the definition of AIDS, which gave women with AIDS access to treatments and social welfare services from which they were otherwise excluded. ACT UP also demanded that the National Institutes of Health take active steps to include women and people of color in its research trials, and the ACT UP Lesbian Caucus pushed the United States Health and Human Services Department to form a Lesbian AIDS Task Force in 1993. Many women in ACT UP came to the organization through their experiences with feminism and were active in both movements simultaneously. For these members (and many others), the group's work on AIDS could not be separated from a broader defense of women's reproductive freedom during a time of attack on abortion rights. Many grew frustrated at the unwillingness of many male ACT UP participants to include abortion in the group's agenda or to acknowledge sexism within the organization itself.

As people of color joined ACT UP in greater numbers, they, too, expressed dismay with the white members' domination of the group, and internal discussions about racism in ACT UP bitterly divided some chapters in the early 1990s. Some members formed People of Color Caucuses within ACT UP, while others left in the mid-1990s to mobilize movements that focused specifically on the political organization of communities of color to fight AIDS. Early groups like the Hispanic AIDS Forum and National

Minority AIDS Council have since been joined by the Asian and Pacific Islander Coalition on HIV/AIDS, the Latino Commission on AIDS, and New York's Audre Lorde Project.

All these factors—public opposition, government surveillance, internal division—did much to sap the organization's strength. But far and away the most difficult obstacle that ACT UP faced was the steady and tragic loss of its members to AIDS. While activists joined ACT UP for a variety of reasons, most were politicized by their own HIV-positive diagnoses. As the disease continued to claim victims, the organization's membership core was constantly under attack. Membership in the group began to decline in 1991, and its visible public protests began to diminish soon thereafter; by 1995, many of the group's chapters had disbanded.

A Changing Disease, a Changing Movement

In part, ACT UP was defeated by its own success. In 1995–1996, AIDS doctors made significant strides in treatment of HIV through the use of protease inhibitors, a new form of drugs that suppressed the virus in the bloodstream and brought dramatic and immediate results for people living with AIDS. Significantly, the first protease inhibitor approved for public use and marketing, saquinavir, moved through the FDA's bureaucracy in only ninety-seven days, testament to the success of ACT UP and other organizations that had challenged the FDA in the preceding years. People with HIV who can afford these new treatments (and whose bodies respond favorably to them) often see less need for radical political activism around the issue of AIDS.

Nevertheless, the ravages of AIDS have decidedly not abated, particularly when the disease is considered on a global scale. By the year 2000, more than 21.8 million people had died of AIDS worldwide, and an estimated 36.1 million were living with the disease. The divisions of race and class in the United States have also been made more apparent by AIDS: in 1998, African Americans accounted for 49 percent of AIDS deaths, and mortality rates among people of color are markedly higher than those among white Americans.

ACT UP continues to exist and fight against AIDS. The group's agenda still places AIDS treatment at the center, especially for people in the Third World who lack access to expensive new drug therapies. ACT UP's largest demonstration since its heyday took place in 1999, when members protested the U.S. government's opposition to a South African plan to support the production of generic equivalents of expensive AIDS treatment drugs to battle the epidemic in that country. But the group's membership and budget are severely strained. The battle against AIDS on a global scale awaits the development of a new social movement that will mobilize the world's population of people with AIDS to fight for their own survival.

Transgender Activism

"Transgender" has become a blanket term to describe a wide range of activities and identities, ranging from heterosexual persons who dress in the clothing of the other gender on occasion to persons who undergo sex reassignment surgery in order to match their sexual anatomy to their gender identity.

Probably no American social movement illustrates more vividly the complications of identity politics in modern society. The relationship between sexual orientation and gender identity is complicated, as is the relationship between transgender activists and the lesbian/gay/bisexual/transgender civil rights movement.

Berdaches

Prior to contact with Europeans, Native American groups had transgendered members. In 1988, historian Will Roscoe listed 133 nations with as many native terms as he could find. In the intervening years, other historians have expanded on that list. When European explorers arrived in the Americas, they began to use the term *berdache*, from the Persian *bardaj*, meaning gay male, to describe these people. The term was not entirely accurate and was used in a pejorative sense. They did not define sexuality or gender identity in the same way that European Christians did. Furthermore, their biological gender was not always that of male. Of course, these native transgendered were part of their respective communities, and some of them held important positions as spiritual leaders, homemakers, farmers, and warriors. The Spanish often used them as examples for the others of how not to behave, and many transgendered natives were abused or murdered.

Molly Clubs

The first real attempt to organize were the Molly Clubs, which first appeared in the late seventeenth century in England. These groups met secretly, mostly around London, allowing members to dress in women's clothes and to interact together as women. There is no evidence that North American colonists had anything similar. North America lacked a large urban center like London, which could provide anonymity. Furthermore, the majority of colonies were established as religious communities with virtually no tolerance for diversity of sexual expression.

After the United States gained its independence and the cities grew in size and diversity, transgender expression began to find an outlet on the stage. Performers in minstrel, vaudeville, and burlesque shows occasionally did female impersonation. Some of the oldest American collegiate theaters, the Hasty Pudding Club at Harvard, the Mask and Wig Club at the University of Pennsylvania, the Triangle Club at Princeton, and the Black Friar Club at the University of Chicago continue to feature cross-dressing performances. Although cross-dressing off of the stage was not socially acceptable, it did sometimes take place at great risk to the person. Some drag performers became famous, such as Julian Eltinge, who starred in several silent films, including *Madame Behave* (1925), and opened his own theater near Times Square. In the early twentieth century, drag balls began to appear in communities like New York, which offered organized social events that continue to the present day.

World War II created a new, albeit unexpected, sense of identity for many gays, and with it, the transgender community found the same. Uncounted thousands of gay people did enlist, or get drafted, in all branches of the military and served overseas. Many interacted with others like themselves for the first time in their lives. In addition, those in Europe were exposed to the more open gay communities in London and post-liberation France. They developed a new sense of identity and community, which led to the opening of new trans-friendly bars and organizations. Although discrimination and hostility in the

McCarthy-era Cold War environment was quite high, more outlets now existed than ever before, making organization increasingly inevitable.

Christine Jorgenson

For many transgendered, as well as nontransgendered, people, the first real revelation came from the unexpected announcement in December 1952 of the sex reassignment surgery of former Army private Christine Jorgenson in Copenhagen, Denmark. When news of the Bronx resident's surgery broke, she made headlines around the country. But her story also inspired others to realize what might be possible. She was inundated with letters and telegrams from many interested in her journey, including others like herself. As more and more transsexuals within the United States came forward, this led to the creation of the first gender clinic in the United States at Johns Hopkins University Hospital in 1966.

Dr. Virginia Prince

One of those inspired by the story of Jorgenson was Dr. Virginia Prince of Los Angeles. Prince, who had a Ph.D. in chemistry, heard of Jorgenson and began to consider pursuing surgery herself. In the end, she decided that it was not for her. Instead, she believed that there must be others like herself who had the desire to cross-dress but did not have the desire to pursue genital surgery. She began publishing *Transvestia* magazine in 1960. As her subscription base grew, she had enough readers in the Los Angeles area by 1962 to consider forming a group. She invited eleven other people to a rented room in Hollywood, asking each of them to bring two bags: one with a food item and one with a pair of nylons and high heels. Thus was born the first cross-dressing organization, the Hose and Heels Club. A few months later, at a retreat near Hunter, New York, Prince announced the founding of a national sorority for cross-dressers called Full Personality Expression (FPE), although it became known by its Greek initials, Phi Pi Epsilon. As FPE chapters began to form around the country, Prince became increasingly active as a speaker and writer. She also is credited with being the creator of the word *transgender*.

One member of the Alpha Chapter of FPE, Carol Beecroft, founded a second organization in 1971 called Mamselle Sorority. Her desire was to provide additional meetings for people in the Los Angeles area. One key difference between FPE and Mamselle was that FPE was open only to heterosexual cross-dressers and their partners, whereas Mamselle was open to all transgendered persons regardless of sexual orientation. In April 1976, the two organizations merged to form the Society for the Second Self (Tri-Ess), which is open to heterosexual cross-dressers only. Beecroft accepted this, believing that it would be easier to form a national organization if the members were united in their interests.

Drag queen Marsha P. Johnson was one of many transgendered patrons at the Stonewall uprising in New York City's Greenwich Village in June 1969. *(Bettye Lane)*

Prince retired *Transvestia* in 1976, but another publication, *Femme Mirror*, continues to be published by Tri-Ess today under the leadership of Jane Ellen and Frances Fairfax of Houston.

Stonewall

The event that has come to define the history of the gay rights movement is one that was triggered by transgendered people, and yet, the transgender com-

munity has, generally speaking, not focused its own history on this event. The June 1969 Stonewall Riots in Greenwich Village began when patrons of the Stonewall Inn, who were predominately drag queens, transsexuals, and their supporters, resisted arrest by New York City police. The resistance and its impact had been well documented elsewhere, but the question of why it could begin with transgendered people, and why both the gay and trans communities tend to ignore that fact, is indicative of divisions between the two movements. Many in the gay community are transphobic and do not wish to acknowledge their gratitude to trans members for standing first, while simultaneously, many trans people are homophobic and deny any association with the gay community.

Fantasia Fair

The oldest annual event in the transgender community is Fantasia Fair. It was first held in October 1975 in Provincetown, Massachusetts. The idea for an event came from the Boston-area support group the Cherrystones. They chose Provincetown because of its reputation for tolerance of all regardless of sex, orientation, or identity. The first fair had about forty attendees.

Its programs include seminars on makeup and feminine presentation, sex reassignment surgery, and various personal issues, including professional, family, and spiritual concerns. Over the years, management of the fair was handled by the Outreach Institute of Gender Studies (OIGS) and its director, Ari Kane. In subsequent years, Fantasia Fair expanded its reach to include the growing Female to Male (FTM) community. In 2001, the board of Fantasia Fair voted to divorce itself from OIGS and become a separate organization. It incorporated under the name Real Life Experience (RLE).

The success of Fantasia Fair inspired other groups to start their own conventions, including Tri-Ess with Holiday En Femme in 1978.

IFGE

One of those inspired by seeing Kane on a Boston television talk show was Merissa Sherrill Lynn. This led to her contacting, first, the Gender Identity Service in Boston and, subsequently, the Cherrystone Club. Lynn was exposed through the Cherrystone library to a wider array of reading materials than she knew existed, but she still felt that there was a niche not being served. With the creation of a new group in the Boston area, Tiffany Club, Lynn started a new publication called *Tapestry*. Her purpose was to provide nonsexual community news and information. Then, while attending the seventh Fantasia Fair in Provincetown in 1981, Lynn participated in a meeting sponsored by Betty Ann Lind of Washington, D.C., in Chicago House on Winslow Street. That meeting was the first effort to bring together national leaders. From that discussion emerged an agreement to create a national transgender organization that would bring together the entire community on a regular basis and would attempt to pull together the varied interests of the transgender community. This resulted in the creation of the International Foundation for Gender Education (IFGE) in 1986, with Lynn as its first executive director. *Tapestry*, with Lynn as editor, became the organization's official publication. The first IFGE convention was held the following year in Chicago with the name Coming Together.

Trans Activism

The murder of twenty-one-year-old Brandon Brayman (Brandon Teena) and two friends in Humboldt, Nebraska, in December 1993 triggered a new sense of identity within the transgender community. This event served as the basis for a book, *All S-He Wanted,* by Aphrodite Jones (1996), and a motion picture, *Boys Don't Cry* (1999), for which actress Hilary Swank won an Academy Award. But the event's greatest impact lay in helping galvanize many transgendered groups and leaders into assuming a more activist role. The murder site was visited by Tonye Barreto-Neto (Transgender Officers Protect and Serve, TOPS), author Leslie Feinberg, and Riki Ann Wilchins (Transexual Menace).

The FTM community began to become increasingly visible and active. FTM International, founded by Louis Sullivan before he died of AIDS in 1991, sponsored its first national Conference of the Americas in August 1995 in San Francisco. It was the first time a convention focused entirely on the concerns of FTMs had ever been organized.

That same year, members of the entire transgender community lobbied Congress for language inclusive of gender identity in the Employment Non-Discrimination Bill. This effort was coordinated by attorney Phyllis Frye of the International Conference on Transgender Law and Employment Policy (ICTLEP). Several subsequent Lobby Days have taken place since 1995.

This increased political activism led to the creation of a political action committee, GenderPAC, designed to focus on the concerns of the transgender community. This resulted from a growing desire by

many trans activists to have a formal organization that could lobby full-time in Washington. The final touches were made during a meeting in Philadelphia in November 1996, sponsored by Renaissance Education Association. It included many transgender groups, including the American Educational Gender Information Service and It's Time America! Wilchins was appointed as the first executive director. In 1999, however, disagreements between the leadership of GenderPAC and organizations that created it led to the creation of a new lobbying organization, the National Transgender Advocacy Coalition (NTAC), with Yoseñio Lewis at the helm. Wilchins and GenderPAC have explicitly adopted a program of activism against gender expectations and roles under the aegis of poststructuralist and queer theorists, particularly Judith Butler. They argue that a specific focus on transgender issues perpetuates an apparent separation between transgender persons and persons with "normal" gender identities, when in fact all persons suffer from oppression based on gender categories. Transgender activists, in turn, have criticized Wilchins and GenderPAC for operating with a theoretical model that appeals to highly educated white activists while failing to account for the problems faced by transgender persons who are also racial or ethnic minorities, or from lower socioeconomic positions.

The transgender movement continues to grow and evolve as its members become more visible and active in the twenty-first century.

Conservative, Nativist, and Right-Wing Movements

Introduction

Conservative social movements in the United States defy easy categorization. Dozens of different conservative groups have struggled for myriad causes, ranging from the expulsion of Chinese immigrants to the elimination of federal taxation to the establishment of a Christian Republic. These groups have adopted various forms of organization, including mobs, paramilitary cells, and political parties, and they have used numerous tactics, including violence, political mobilization, and civil disobedience, to forward their causes. Making generalization about conservative social movements more difficult is the tension running through conservatism between its libertarian and normative forms. Some conservatives have sought to drastically reduce the roles of federal and state governments in the economic and social lives of Americans, while other conservatives have insisted that the state not only guarantee law and order but also regulate many important aspects of social life, including religion, leisure, sexuality, reproduction, and morality. Ultimately, however, conservatives have, with a few notable exceptions, found common ground in the promotion of individualism, property rights, free enterprise, law and order, and some form of nationalism. Opposition to socialism, communism, environmentalism, unions, and taxation has also brought conservatives together, as have racism and nativism, again with important exceptions.

What has been remarkable about conservative movements is that their participants have deemed them necessary in such a conservative country. In this regard, they have been reactive efforts to preserve the benefits of an existing social order against perceived threats. This has been the case with racist and nativist groups, including the Know-Nothings in the 1850s, the Ku Klux Klan from the 1870s to the 1920s, Social Darwinian anti-immigration advocates at the turn of the twentieth century, White Citizens Councils in the 1950s and 1960s, and neo-Nazis in the 1980s and 1990s. It has also been the case with libertarian conservative movements, which have sought to retard the growth of the welfare state, and normative conservative movements, which have opposed liberalism, feminism, secularism, and internationalism. In making their appeals to preserve the social order, conservatives have often invoked a mythical American past of self-sufficient, God-fearing, community-minded, morally righteous, and hard-working people. As they see it, America is fundamentally a harmonious, beneficent, and self-regulating country of such people and would remain such but for misguided politicians and policies. Conservative movements thus seek to maintain or restore a distinctly American set of social arrangements that includes a distinct group of people.

Despite their frequent invocations of a glorified past, most conservatives have not been antimodern. They have continued to respect the traditions they value while embracing potentially disruptive changes brought about by capitalism, such as technological innovation, the rise of conglomerates, and the development of mass media. Most often, conservatives achieve this uneasy balance by combining modern economic philosophy with traditional social ideals. Thus, conservatives of all stripes have promoted free markets, property rights, and the importance of self-sufficiency. Some, including elitist conservative intellectuals like Russell Kirk and Friedrich von Hayek in the 1940s and 1950s, have adopted a philosophical individualism consonant with extreme laissez-faire economic thought. They have needed no balancing act to meld their social and economic thought. It has been normative conservatives, such as those in racist, nativist, or Christian conservative movements, who have had to find ways to combine seemingly contradictory free-market economic thought with proscriptive social policy. Nativists have appealed to a sense of moral economy to justify their interference in free-labor markets when they have demanded the exclusion of immigrants and African Americans from certain jobs. Similarly, Christian conservatives have

called for limits on the freedom of free markets when they have sought to restrict the content of television, music, and film, and their insistence on respect for authority, self-control, moral righteousness, and religiosity has put limits on the free will of individuals. Taken to their logical conclusions, normative conservative tenets can be contradictory, but conservatives have successfully mixed and matched their ideals to create a viable worldview that millions have lived by even as the development of capitalism has undermined the social basis for many of those ideals.

Conservative movements have drawn their supporters from various groups of Americans. Leaders have most often come from the country's elites, including wealthy businesspeople, religious leaders, and intellectuals. Supporters have most often been middle class, including small-business people, professionals, managers, and supervisors. Some skilled and unskilled workers have also supported conservative movements, most often in the South, but also in places where urban populations kept ties to rural life, such as Michigan. Working-class support for conservatism has focused on its normative aspects—Christian morality, self-control, respect for authority, and nationalism—and less on laissez-faire economic policy. To the extent that working-class people have come to own property, they have become more open to conservative appeals to the overriding importance of property rights. Job concerns have also motivated workers to support such conservative causes as immigration restriction, opposition to affirmative action, and military spending. Not surprisingly, conservative champions of the free market have most often come from the middle and upper classes—those most likely to benefit in the marketplace.

Like other social movements, conservative movements have adopted a wide variety of organizational forms and tactics. Remarkably, given their professed belief in the superiority of the American system, conservatives have employed extralegal tactics, particularly violence and intimidation, to a far greater extent than other movements. In the 1850s, the anti-Catholic, anti-immigrant, and racist American Party, better known as the Know-Nothings, used mob violence as part of its political campaigns. In both its original post–Civil War formation and its second incarnation in the 1910s and 1920s, the Ku Klux Klan was a terrorist organization aimed at violently suppressing the political mobilization of African Americans, Jews, and other "un-American elements." Its tactics included physical intimidation, house bombing, rape, torture, cross burning, and lynching. The American Legion and other paramilitary nationalist organizations frequently attacked strikers, radicals, and Socialists on numerous occasions, just as White Citizens Councils employed violence in their campaigns against racial integration in the South. Making all this violence possible and effective was the complicity of government authorities. Only in the 1990s, when they arrested paramilitary militia members, have government agencies moved quickly to suppress conservative violence. Most other times, it took massive protest and political mobilization to induce government action.

Conservative movements have been extremely successful in the United States. This success reflects the ability of conservatives to articulate a set of policies that have resonated among influential segments of the society, thereby allowing conservatives to develop considerable social, economic, and political power. In part, they have been able to do this because, in defending the status quo, they have momentum on their side. More important, their ideas, particularly those associated with individualism, property rights, free markets, and nationalism, have better reflected the reality as lived by many Americans. That is, conservatism has been more deeply rooted in the social, economic, and political development of the United States than other competing social philosophies.

Aaron Brenner

Conservative Movement

Since the election of President Jimmy Carter in November 1976, political culture in the United States has veered decisively to the right. With the possible exception of the single-term presidency of George H.W. Bush (1989–1993), which scholars argue did little more than consolidate the achievements of the Reagan administration (1981–1989), the trend has been further rightward. Today President George W. Bush (2001–) heads what is not only the most conservative administration in American history but also the most conservative to appear in any Western country since the 1930s.

An effective conservative movement has been the main force propelling the nation's rightward shift since the 1970s. Public opinion polls have consistently demonstrated that the mass of Americans are not less liberal than they were in the 1950s and 1960s; indeed, in relation to social issues they are markedly more liberal. Conservatism has transformed the face of American politics by shifting the political and economic national agenda to the right. Conservatism has promoted unfettered free markets and the elimination of social protections, and has tried to roll back the gains of the civil rights and women's movements achieved in the 1960s and 1970s. Political operators like Howard Phillips, Paul Weyrich, Lee Atwater, Roger Ailes, Karl Rove, and Grover G. Norquist have skillfully manipulated the country's nearly gridlocked electoral system. Generous corporate sponsorship has played an important role in distancing the Republican Party from the economic concerns of lower-middle- and working-class Americans and the mainstream establishment media's ability to filter out the voices of conservatism's most formidable critics and competitors.

The primary vehicle of the modern American conservative movement has been the Republican Party, which, in the 1950s, was in the hands of party moderates. The history of the conservative movement is, therefore, very largely the history of the Republican Party's transformation into an instrument of its conservative flank. It is necessary to point out that American conservatism cannot be identified solely with the Republican Party. Indeed, the conservative movement would never have attained its present level of success without the frequent collaboration of a substantial minority of conservative Democrats.

Historically, the Democratic Party has long carried the burden of a mainly southern minority whose views on many economic and social issues stand well to the right of the party's majority. It is largely thanks to this conservative structure that liberal Democrats have failed to implement initiatives like the 1991 bill that would have outlawed the permanent replacement of striking workers. By the 1990s, however, its conservative flank had effectively transformed the Democratic Party into a force standing further to the right even than the moderate Republicanism that the Republican Party repudiated in the 1960s. Propelling the shift was the Democratic Leadership Council (DLC), an organization for elected Democratic politicians formed early in 1985 by Democratic Party congressional staffer Al From. The function of the DLC was to help the Democrats recapture the White House by bringing back into the fold the so-called Reagan Democrats—middle-class whites who had defected to Reagan in 1980 and 1984.

Initially, the DLC was more concerned with image—with redressing the widespread perception fostered by Republican campaigning that the Democratic Party represented an elitist left-liberalism whose time had passed. But after the party lost its third consecutive presidential election in 1988, the DLC, whose membership by that stage had reached around 200, began fashioning a new policy agenda that was designed to radically transform the way the party was perceived at large. In policy papers released by its newly founded think tank, the Progressive Policy In-

stitute (PPI), the DLC denounced liberalism and embraced positions on the economy, foreign policy, race, and welfare that were often difficult to distinguish from those advocated by conservatives.

The DLC policy mix—whose conservative thrust was rendered more palatable to the party's grassroots supporters by a mild social liberalism—became the Democratic Party's official platform when in 1992 it was adopted as the program of the party's presidential nominee, William Jefferson Clinton. During Clinton's tenure of the White House (1993–2001), it became apparent that the Clinton "New Democrats" differed only modestly from their Republican competitors. Although Republicans campaigned aggressively against many Clinton initiatives, it is likely that they would have supported them if they had come from a Republican president.

To be sure, the New Democrats thought of themselves as exemplifying centrism rather than conservatism. Their policy agenda aspired to represent a "progressive" Third Way between the party's erstwhile liberalism and the conservative Republican alternative. However, under pressure from the right—largely via the media—the New Democrats effectively implemented conservative policies while placating their liberal constituency with symbolic gestures, such as Clinton's 1997 apology for the infamous Tuskegee experiments on syphilitic black men. An important source of conservative success, therefore, is to be found in the Democratic Party's reluctance to stand for more than symbolic continuity with the country's progressive political tradition.

A second force independent of the Republican Party that has underwritten the conservative revolution is the American strain of right-wing libertarianism. During the 1950s and 1960s, libertarians were fellow travelers of the nascent conservative movement, an alliance that was capped by the so-called fusionism of Frank S. Meyer's *In Defense of Freedom: A Conservative Credo* (1962). Libertarianism reemerged as a political ideology distinct from conservatism due to the work of Murray N. Rothbard, a political philosopher who took the view that conservatives conceded far too much when they endorsed the minimal state as a necessary evil. While conservatives disapproved of the postwar growth of the state, Rothbard disapproved of the state itself. During the late 1960s and early 1970s, Rothbard perfected a blend of radical antistatism and Austrian liberal economics that enjoys considerable currency in the United States today, particularly on the Internet. Although libertarians (or "anarcho-capitalists") are staunch opponents of American militarism, which often makes them forceful critics of the new conservative establishment, their antistatist rhetoric has served conservative purposes by fostering an ideological climate in which the unregulated "free market" is seen as the greatest force for good in the world and state intervention in spheres such as education, health, and welfare is dismissed out of hand as counterproductive and even dangerous.

Conservatives Take Control of the Republican Party

Pioneering Intellectuals

The conservative movement's original momentum came from a relatively small number of ideological entrepreneurs whose books appeared in the late 1940s and early 1950s. Among what scholars termed the New Conservatives were writers like Richard Weaver, Peter Viereck, Ayn Rand, Frank Chodorov, Russell Kirk, Willmoore Kendall, Raymond Moley, and William F. Buckley. Although these writers did not share a homogeneous ideological outlook, they all had a tendency to identify with the "individual" against the "mass." These early conservatives stood against the collectivism that was embodied by welfare state programs that they detected in the postwar development of the American welfare state. They often shared the alarmist diagnosis of Friedrich von Hayek's immensely influential political tract *The Road to Serfdom* (1944). According to Hayek, recent tendencies within liberal democracies like Britain and the United States were reminiscent of those that in Germany had contributed to the rise of National Socialism in the 1930s. The notion that the United States, fresh from a victory over Nazism, had set out on its own trajectory to "collectivism" provided nascent conservatism with perhaps its most powerful idea.

During the Truman era, conservatives were lone operators situated firmly outside the mildly progressive consensual political discourse. Only during the Eisenhower administration did they begin to encounter a wider echo in society. Russell Kirk's *Conservative Mind, from Burke to Eliot* (1995) is generally recognized as the work that made conservative ideas respectable again. In the wake of the success of *Conservative Mind*, a lively intellectual conservative movement began to grow, and Kirk himself was to enjoy a long career as one of its leading spokesmen. Although he does not loom nearly as large as Kirk in the numerous histories of the conservative movement, the libertarian Frank

Founder of the group Young Americans for Freedom and the magazine *The National Review*, William F. Buckley has been perhaps the nation's most influential conservative voice for more than half a century. A prolific author, he is shown here in 1998 at a symposium at Greenwich Library in Connecticut. *(AP Wide World Photos)*

Chodorov was important as a force for the diffusion of free-market ideology on U.S. campuses. In 1953, he founded the Intercollegiate Society of Individualists (ISI). Functioning primarily as a student book club, the ISI distributed, free or for a nominal charge, paperback editions of Hayek's *The Road to Serfdom*, Richard Weaver's *Ideas Have Consequences* (1948), and Chodorov's *One Is a Crowd: Reflections of an Individualist* (1940).

Of the pioneering conservatives, multimillionaire Buckley can be cited as the most important. Buckley—who was the ISI's first president—wrote the first major conservative attack on liberal education in America, *God and Man at Yale: The Superstitions of Academic Freedom* (1951), and founded the first major conservative magazine, *The National Review*, which commenced publication in 1955. Together with public relations expert Marvin Liebman, Buckley also founded an important conservative youth organization, Young Americans for Freedom (YAF). In YAF's founding document, the so-called Sharon Statement—named after Buckley's ancestral estate in Sharon, Connecticut, where YAF's first meeting was held in September 1960—the new organization declared itself a grouping of "90 of the best and brightest conservative minds" committed to the doctrine of free will, economic freedom, law and order, minimal government, states' rights, militant anti-Communism, and a nationalist foreign policy.

Yet none of this formidable intellectual power would have been to any avail had the Republican Party not been captured and harnessed as a compliant political vehicle for the new conservatism. Without control of either of the two major political parties, conservatism would never have emerged as an important electoral force, let alone the major force shaping the nation's destiny. For with the possible exception of pockets like Orange County in Southern California in the early 1960s, conservatism was never a mass social movement. It was, however, a major insurgency within the GOP (for Grand Old Party, a synonym for the Republican Party).

WILLIAM FRANK BUCKLEY JR.

(1925–)

Born in New York City on November 24, 1925, Buckley was the sixth of ten children of a Catholic oilman who championed conservative causes and raised his family to do likewise. Buckley spent his early childhood in France and England, attended a private boarding school in upstate New York, and graduated from Yale in 1950. His father encouraged him to read the works of Albert Jay Nock, an anti–New Dealer who argued that Communism and fascism could best be met by American economic growth based on reducing regulation and taxes. Nock's ideas and Buckley's privileged background deeply influenced Buckley, and he rose to become one of the most popular, eloquent, and witty spokesmen for the conservative point of view in the late twentieth century.

Shortly after graduation, Buckley published his first work of nonfiction, *God and Man at Yale* (1951). In it, Buckley asserts the conservative point of view as it pertains specifically to the theory of education. Buckley questions the level of secularization of American schools. He accuses it of hypocrisy in its movement away from the ideological foundation upon which the institution was built. In his opinion, Yale was founded upon the belief in God. Therefore, virtue and individualism should have been cornerstones of a Yale education. But Buckley found that in his time at Yale the university was embracing "statism and atheism," the alternative to which was a return to political conservatism, according to Buckley.

Buckley then became an editor for *The American Mercury* (1951–1952) and went on to found the *National Review* in 1955, which soon became the leading journal of conservative opinion in the United States. He remained editor in chief until his retirement in 1990. A devout Catholic, he spoke out against Pope John XXIII's encyclical *Mater et Magistra*, issued in 1961. His objection that it focused attention on social as well as moral issues sparked debate among American Catholics. He encouraged a more progressive church that would allow its priests to marry and would not oppose divorce and contraception.

In 1965, Buckley was an unsuccessful candidate for mayor of New York City, receiving about 12 percent of the vote. Buckley wrote about his campaign experience in the entertaining firsthand account, *The Unmaking of a Mayor* (1966). That same year, he launched his popular weekly political television talk show, *Firing Line*, a show he hosted for the next thirty-three years. His strong showing on the Conservative Party ticket in the three-way race prefigured Richard Nixon's election to the presidency in 1968 and the rise of the conservative wing of the Republican Party led by Ronald Reagan in the 1980s. His public support of the Nixon, Ford, and Reagan administrations, along with his television show, gave him celebrity status, a rarity at that time for a political pundit. Throughout that time, Buckley remained an icon of conservative thought. His writing has sparked healthy debate between individuals with both liberal and conservative points of view.

Buckley writes a syndicated newspaper column, "On the Right." He has also published over forty fiction books, including several best-selling spy novels. In addition, he is an accomplished harpsichordist and sailor. His range of talents and erudite style have made him something of a Renaissance man and one of the most respected voices in the conservative movement.

James G. Lewis

The early history of the conservative movement has yet to be written from a sociological point of view, and only the loosest generalizations can be hazarded about those who supported the movement before it became an institutionalized political force. What seems clear enough is that ideologues like Buckley enjoyed the backing of reactionary (i.e., anti–New Deal) elements of the business class. The impetus for the ISI, for example, came from a businessman who had read an article in which Chodorov pointed out that socialism might be eradicated in America by a campaign to instill the young with free-enterprise principles and a reverence for private property. He promptly sent Chodorov a $1,000 check to start up "freedom" clubs on U.S. campuses. The movement's real shakers and movers were business magnates like J. Howard Pew of Sun Oil and Eugene S. Pulliam, publisher of the *Indianapolis News*, who contributed financially to the cause.

Geographically, the social elements financing the new conservatism were found mainly in the southern and midwestern regions of the United States, where they remained separated from the liberal currents that emanated from the major educational institutions situated in the Northeast. What united such men in opposition to the dominant liberal culture was op-

position to trade unionism and the steps that had been taken toward a modern welfare state. Galvanized by the disconcertingly popular 1945–1946 strikes and the unexpected victory of Harry Truman at the polls in 1948, businessmen associated with organizations like the National Association of Manufacturers (NAM) mounted a series of ad hoc initiatives intended to undermine organized labor, denounce welfare, and school American workers in the virtues of free-enterprise capitalism. They funded institutions like the Foundation for Economic Education, the Industrial Information Institute, and the American Heritage Foundation to disseminate pro-business ideology, and they pressured broadcasters and journalists to tone down stories sympathetic to labor.

By the 1950s, however, once it was clear that the Eisenhower administration did not plan to reduce government spending or reverse any of the key postwar developments they opposed, businessmen supplemented their local initiatives with a broader political activism aimed at taking control of the Republican Party away from the Eisenhower moderates by using knowledge and skillful maneuvers over GOP rules and procedures in states in which the electoral laws facilitated the capture of the party by grassroots activists. Conservatives gained the upper hand over an establishment that chiefly represented the Northeast, a region that was becoming relatively less important to the nation as a whole. The takeover was accomplished between 1957 and 1964 and consolidated by 1968.

Discontent with Eisenhower

Since 1884, the Republican Party has been internally divided between an eastern, urban, liberal faction that supported effective and well-managed public services and the so-called stalwarts or Old Guard Republicans, who objected to liberal reforms and generally supported business interests. Until the Crash of 1929 discredited financial capitalism, the stalwarts dominated the party. But in the wake of the New Deal, eastern liberals based mainly in New York came to control it. The stalwarts, unreconciled to the New Deal reforms that lay the basis for the country's subsequent prosperity, formed into a minority led by Senator Robert A. Taft (R-OH). This group was composed overwhelmingly of men (like Prescott Bush and Taft himself) whose business affairs had either prospered or suffered relatively little during the Depression.

Following Taft's death in 1953, the stalwarts found themselves leaderless. The conservative movement received a further blow when anti-Communist zealot Senator Joseph McCarthy (R-WI) was discredited in 1954. Under President Dwight Eisenhower, who was elected in 1952, the party moderates were clearly in control. Although Taft conservatives did not trust Eisenhower, who once described himself as "conservative on the economy and generally a progressive," conservative opposition remained muted. However, simmering conservative discontent began to boil over during Eisenhower's more uncertain second term. After being reelected in November 1956, the president adopted a domestic policy that was based on constructive government intervention. He strengthened government welfare programs, created the Department of Health, Education, and Welfare, broadened the Social Security system, increased the minimum wage, overhauled the federal tax system, and initiated the most costly domestic program ever, the Interstate Highway system.

Conservative opposition reached fever pitch in 1957 when details of the president's forthcoming $71.8 billion budget—the largest peacetime budget in the country's history—were leaked. Although they wanted more spending on the military to confront the Communist threat, conservatives were unwilling to accept the deficit this entailed. George M. Humphrey, Eisenhower's secretary of the Treasury, who resigned shortly afterward, warned that it would precipitate "a depression that will curl your hair." Whether or not the development was related to the 1958 budget, 1958–1959 saw the first major recession since the war had ended, a circumstance that partly accounted for the loss of 8 million votes to the Democrats at the polls in 1958. Conservatives interpreted the party's extremely poor showing in 1958 as a sign that the nation had rejected the president's "modern Republicanism," while party moderates blamed the disaster on the party's "extreme right wing fanatical fringe."

The conservative attempt to capture control of the GOP from Eisenhower Republicans began when, against the backdrop of the 1957–1958 budget controversy, the conservatives seized the party's youth wing, the Young Republican National Federation (YR). Founded in Washington in 1931, the YR began to take a rightward turn at its 1957 convention when F. Clifton White and William E. Rusher, two members of the New York State Young Republican Federation, vehemently opposed modern Republicanism. The Young Republicans immediately staked positions on several topical issues that were diametrically opposed to those of the Eisenhower administration. Cultural exchanges with Communist countries and compulsory unionism were rejected, as was federal financial

aid for general public education and school construction. "The Syndicate," as the Rusher-White faction was known, scored a further victory in 1959 when, at the YR convention in Denver, Rusher and White saw through the election of an alliance that was overtly anti-Rockefeller, anti-Eastern, and antiliberal. On that occasion, Ned Cushing, a young banker from Kansas, was elected chairman. The convention proceeded to adopt what Cushing referred to as "the most conservative [platform] in the history of the federation," including the virtual elimination of Social Security.

The Man from Arizona

By 1959, the GOP had entered a period of relative unity. One reason for the de facto truce between factions was renewed support for the president. Conservatives felt more comfortable with Eisenhower once he embraced the cause of fiscal austerity, which he did after the Democrats elected in 1958 mooted plans to increase social spending. However, the primary reason was the party's need to rally behind its 1960 presidential candidate. Although neither moderates nor conservatives were entirely satisfied with chief contender, Richard M. Nixon, neither was able to produce a candidate who stood a better chance of winning. While Nixon spent most of his campaign trying to avoid offending either faction, the conservatives proved extremely hard to please. In particular, they objected to the so-called Pact of Fifth Avenue, the agreement Nixon had signed with Rockefeller, his running mate, calling on Nixon to strengthen his positions on civil rights. Most conservatives interpreted the agreement as a full-blown sellout to moderate Republicanism.

Although Nixon narrowly lost the 1960 election to John F. Kennedy, the South and Southwest emerged as clear growth areas for the GOP, which had been building viable party organizations in these regions since the 1920s. Investing in conservative ideology was, therefore, investing the party's future in the growth of the southern vote. Although he had the advantage of coming from Southern California, Nixon did not speak for the Sunbelt nearly as clearly as Senator Barry Goldwater (R-AZ). Goldwater first came to national attention as the most forthright critic of the 1958 budget, which he depicted as a gross betrayal of the mandate the nation had bestowed upon Eisenhower in 1956. Then in 1960 he consolidated his support among GOP conservatives when he bitterly denounced the Rockefeller-Nixon agreement, which he dubbed the "Surrender of Fifth Street." In October 1961, under the leadership of F. Clifton White, twenty-two conservatives, mostly Young Republicans, assembled in a Chicago motel where a committee was formed to pressure the Republican Party into nominating Goldwater as its presidential candidate in 1964. White and his supporters in the Draft Goldwater Committee spent two years traveling around the country building support for Goldwater before the GOP was finally wrested from the grip of its Eastern leaders and Goldwater was nominated.

Some rather airy explanations have been offered for the tremendous impact Goldwater had on the country in the leadup to the 1964 election. Yet it seems clear in retrospect that Goldwater's appeal was comparatively straightforward: he was the first attractive national political figure whose rhetoric presented pro-business conservatism as a moral choice. According to the journal *Human Events*, Goldwater's *The Conscience of a Conservative* (1960) provided "humanitarian reasons for following policies which have usually been associated with a mere lust for gain." Business funded Goldwater's campaign with unprecedented generosity. He raised $7 million more than Nixon had in 1960, ending his campaign with a surplus that was sufficient to provide the seed money for several new conservative organizations. By giving vent to the sort of pro-business conservatism to which they had been exposed in the course of campaigns such as those waged by the NAM, Goldwater inspired a great many people to experience a thrill that at last someone was speaking out loudly and clearly on behalf of views that seemed to them entirely commonsensical.

Goldwater also benefited from the fact that the GOP was becoming better versed in the public relations techniques demanded by the television age. Kennedy's victory over Nixon in 1960 was largely attributed to his impressive appearance on TV (Nixon was said to perform best on radio). The GOP therefore hired advertising executives to spruce up the party's image. As part of the public relations process, the spotlight fell on younger candidates. For conservatives, it was imperative that conservatism came across as youthful and congenial rather than old and cantankerous. If Goldwater was not all that young, he was at least considered ruggedly good looking. He also possessed a certain straightshooting candor that many young people, in particular, found appealing.

During the course of the Goldwater campaign, conservatives based in the southern and midwestern states established firm control of the presidential GOP. In fact, the party's liberal wing never regained control of the party, and the highest office its leader, Nelson Rockefeller, ever attained was the vice presidency. The

Nicknamed "Mr. Conservative," Arizona senator Barry Goldwater won the Republican nomination for president in 1964. Despite his overwhelming defeat by Democrat Lyndon Johnson, his campaign inspired many conservatives and paved the way for Ronald Reagan's election in 1980. Late in life, Goldwater voiced many libertarian beliefs. *(AP Wide World Photos)*

social basis for conservative domination of the Republican Party was not the Taftite stalwarts, however, but a fresh ingredient in the mix, the so-called Easy Street Republicans. This new group owed its existence primarily to the military-industrial complex. Its basis was the phenomenal 62 percent of the federal budget which, between 1946 and 1965, was allocated to defense spending. Easy Street Republicans were found chiefly in the South and the Southwest, in centers like Orange County, California, which depended almost entirely on government defense contracts. During the Cold War, defense contracts brought unprecedented prosperity to many previously backward regions of the United States. Between 1940 and 1960, the population of Orange County grew by an astonishing 385 percent. By 1960, most Orange County residents earned incomes markedly higher than the national average and enjoyed a rate of home ownership—around 70 percent—that was higher than that of any other part of the country. While not everyone in Orange County—and other such regions whose growth was fueled by the military-industrial complex—was employed in the defense sector, most everyone who grew rich in such regions did so by providing those who were not in the sector with support services.

After the Goldwater Debacle

Despite the extensive appeal of his antistatist ideology, Goldwater's presidential campaign came to an ignominious conclusion, and his Democratic opponent, Lyndon Baines Johnson, won by a landslide. The only part of the nation that Goldwater carried was the South—by far the country's most conservative quarter and the region that had experienced the most marked social upheavals in recent times.

Despite the crushing extent of the defeat, the mid-1960s witnessed the entrenchment of conservatism's hold over the Republican Party. Although liberal Republicans tried to benefit from the crisis, they lacked a sufficiently large grassroots base to prevail against the conservative tide. Important in this respect was the fact that GOP liberals were essentially pragmatists who dealt with developments as they arose rather than through the lens of ideology. Their pragmatism was a major weakness in an increasingly ideologized political environment. For all his talk about modern Republicanism, Eisenhower had never sponsored a movement to turn it into an intellectual force. The inability of party liberals to understand the importance of ideas in politics left them vulnerable to the charge that they represented nothing more than accommodation with the Democratic Party. Despite attempts to breathe life into liberal Republicanism, after 1965 liberal Republicanism entered a stage of decline that left it virtually irrelevant by the time Nixon was elected in 1968.

The conservative movement largely evaded responsibility for the Goldwater defeat by blaming dishonest advertising by the Democrats and widespread media misrepresentation of Goldwater's views. The movement continued to build on what it had achieved during the course of the campaign. In January 1965, Marvin Liebman and Robert E. Bauman founded the American Conservative Union (ACU) as a permanent vehicle for tapping the resources of the short-lived groups that had mobilized in support of Goldwater's candidacy. The ACU and the many new conservative groups heeded the most important lesson of the campaign—the ease with which the Democrats could

identify them with the John Birch Society (JBS), a right-wing organization opposed to the 1960s movements, and other extreme right-wing groups. Liebman, supported by Buckley, made an effort to keep JBS members out of the ACU. However, the ACU majority did not want to risk alienating rank-and-file Birchers, and in the end Liebman and Buckley had to make do with a public statement declaring only that the JBS and the ACU were "distinct" organizations.

Clearly, while distinguishing conservatism from the radical Right was an aim of the most sensitive conservative operatives, it was one that conflicted with a higher priority—the need to build a Republican majority. In the course of his campaign for mayor of New York, however, Buckley made a further effort to distinguish the sort of conservatism for which he stood from the hysterical anti-Communism and racial bigotry of the Far Right. In *The National Review* in October 1965, he and a number of other contributors attacked what Buckley called the "surrealisms" of JBS leader Robert Welch, pointing out that the kind of conspiracy theories in which Welch believed were shared by many Birchers. Although many Birchers (and members of other far-right-wing groups) regarded Buckley's attacks as an act of betrayal, it certainly helped Buckley, whose campaign benefited from the perception that a clear distinction existed between conservatism and the Far Right.

That conservatism was, despite the Goldwater defeat, not necessarily an electoral liability for the Republican Party seemed roundly demonstrated by its first major victory, the election of Ronald Reagan as governor of California in 1966. During his 1966 gubernatorial campaign, conservatism benefited from the emergence of the counterculture as an electoral issue. In 1964, the moralistic rhetoric of the Goldwater campaign had foundered precisely because no real threats to American peace and stability existed. Indeed, in the early 1960s, Americans had never had it so good. By 1966, however, Reagan was able to exploit two recent developments that struck fear into many middle-class hearts. These were, first, the civil rights movement's escalation into a more violent phase and, second, the growth of student unrest on the Berkeley campus of the University of California. Profiting from sensational media reporting that focused on inner-city violence and "campus malcontents," Reagan turned his campaign into a debate about retaking control of a society that was allegedly sliding into chaos.

By latching on to the new student activism as a campaign issue, Reagan showed the GOP that implacable opposition to the trends associated with the growing independence of youth (sexual liberation, marijuana), although they affected, at this stage, only a relatively small number of students, could nonetheless be transformed, with the assistance of a sympathetic press, into a formula for electoral success. He also performed another important service for Republican conservatives. During the campaign, he proved adept in teaching the electorate how to distinguish between conservatism and the anti-Communist fringe. He succeeded in distancing himself from the JBS by denouncing only some of Robert Welch's ideas. Ordinary Birchers, on the other hand, he described as "fine upstanding citizens." With his law-and-order policies glossed by a sugarcoated, genial public image, Reagan brought together the essential ingredients of a textbook conservative victory when he won fifty-five out of fifty-eight counties against two-term Democratic governor Pat Brown.

Nixon's Conservatism

In 1968, conservatives remained sufficiently tarnished by the 1964 debacle that they were not in a position to have a conservative nominated as the GOP's presidential candidate. Although there was a groundswell of support for the idea of Reagan entering the fray, in the end the field was left open to Richard Nixon, whose chief rival for the nomination was Nelson Rockefeller. Although GOP conservatives had never regarded Nixon as a member of their own camp, he enjoyed the advantage of being acceptable to them, whereas Rockefeller remained anathema. Conservatives were only too happy to support Nixon over Rockefeller. In any case, by the time of the 1968 presidential contest, Nixon's image was rather more conservative than it had been in 1960. His conservative appeal had been powerfully reinforced by the rhetoric of his new speechwriter, staunch conservative Patrick Buchanan, who helped him target his arguments at what Buchanan called the "silent majority." Nixon also won the backing of some of the country's most high-profile conservatives—Goldwater, Buckley, Senator Strom Thurmond (R-SC), and Clare Booth Luce—a considerable feat for a man who at the same time was able to successfully cultivate the support of key party moderates.

Nixon also shared the advantages Reagan had enjoyed in California in 1966. As the civil rights movement became more militant, student protests against the Vietnam War escalated, and the news media paid more and more attention to urban crime, Nixon's campaign was played out against the backdrop of gathering social crisis, making the moment opportune

for conservative "law-and-order" rhetoric. A further feature of the 1968 electoral landscape that redounded to the conservatives' advantage was that this time there was a prominent "extremist" candidate, Governor George Wallace of Alabama. The clear differences between Nixon and Wallace made it impossible for anyone to think of Nixon as a fanatic.

Once elected, however, Nixon governed in a way that greatly disappointed his more diehard conservative supporters. Conservative dissatisfaction with Nixon came to a head in 1971, when he pursued policies that were deemed at odds with his conservative mandate: the opening of diplomatic relations with the People's Republic of China, détente with the Soviet Union, and the imposition of wage and price controls, the most stringent implemented since World War II.

In July 1971, the "Manhattan Twelve," a group of leading conservatives, including Buckley, Rusher, Tom Winter, and Allen Ryskind of *Human Events*, Randal Teague of YAF, and John Jones and Jeff Bell of the ACU, announced their "suspension of support" for the president in the forthcoming election. By December, they had recruited another dismayed conservative, John Ashbrook, the ACU's chairman, to challenge Nixon in the primaries. Ashbrook's campaign, which Rusher started off with a $1,000 check, was premised on the view that Nixon's policies were carrying the nation to the brink of disaster. Although the campaign generated substantial support from YAF and young conservatives generally, it fizzled after disappointing results in three states where Ashbrook had campaigned vigorously. Despite its failure, conservatives credit the Ashbrook candidacy with Nixon's decision to veto the Child Development Act in 1971, a progressive initiative sponsored by Senator Jacob Javits (R-NY). They also believe that it obliged Nixon to govern in a more conservative manner throughout his second term.

Nixon's second term began by showing every indication of being more conservative than his first. "Let us remember that America was not built by government but by people; not by welfare, but by work," he intoned in his second inaugural address. Yet we will never know how the American people would have responded to Nixon's new conservatism, for the Watergate revelations soon precipitated his downfall and created a reaction at the polls in 1974 and 1976 that benefited the Democrats. Many commentators believe that, despite the Democratic victories, Watergate helped consolidate the conservative agenda by fostering public distrust of the executive branch.

Yet what really paved the way for the conservative ascendancy was the electorate's rejection of President Gerald Ford at the 1976 elections. The American business community had benefited greatly from the fact that Nixon's successor was a staunch defender of business interests. Throughout his tenure in the White House, Ford vetoed almost every Democratic initiative of any importance, thereby stalling the labor–public interest coalition that had for a time seemed capable of changing the face of the nation forever. Yet conservatives remained dissatisfied with Ford, whose politics were in most other respects continuous with those of the (first) Nixon administration.

Buckley, Rusher, and others from the crowd that had sponsored Ashbrook's bid for the presidential nomination against Nixon cast around for a conservative challenger to Ford. They even considered forming a third party to run Ronald Reagan (who had completed his second term as governor of California in 1974) on a ticket with George Wallace. However, after Reagan launched a bid for the Republican Party nomination in 1975, the third party idea was dropped and conservatives rallied behind Reagan's campaign. Reagan miscalculated badly, however, when, in a bid to broaden his electoral appeal, he endorsed party moderate Richard Schweiker (R-PA)—the only Republican senator who has ever received the endorsement of the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO)—as his running mate. The decision to share the ticket with a moderate annoyed key southern Republican politicians like Senator Jesse Helms (R-NC), who switched over to Ford at the last minute, ensuring that Ford won the nomination.

The Politics of Economic Recovery

By the time Ford was defeated by Carter at the polls in November 1976, the party had settled on tax cuts as its primary cure-all for the nation's economic ills. The post-1973 economic crisis had initially focused the nation's attention on rising unemployment, an issue that briefly became the Democrats' defining cause. For wealthier Americans, the economic malaise was interpreted as proof that American governance had taken a turn in an anticapitalist direction. During the Carter era, conservatives claimed that excessive government spending had hampered economic recovery by "crowding out" private firms from the credit market and that business's performance was hampered by excessive governmental regulation.

These two myths brought business and the conservative movement together on the basis of shared interest. The very forces that, so it was claimed, im-

Ronald Reagan gives the thumbs up to a cheering crowd in Los Angeles on November 5, 1980, a day after winning the presidential election. Reagan's presidency marked the major political triumph of the conservative movement in the late twentieth century. *(AP Wide World Photos)*

peded economic recovery were precisely the things that conservatives abhorred for ideological reasons—strongly progressive taxation and governmental regulation. Once the Republican Party took up the cause of supply-side economics, which offered a theoretical rationale for generous tax cuts for the rich, and radical deregulation, all conservatives had to do was convince business political action committees to direct their moneys to Republican candidates on the basis of ideological compatibility. Republican operatives proved successful in making business alter its traditional electoral strategy, which had previously involved ensuring access to incumbent politicians regardless of party. In the 1980 elections, business funded Republican candidates generously, a practice that was even expanded in the 1982 midterm elections, when five times as many funds went to the Republican Party as to the Democratic Party.

One of the striking facts about the 1980 presidential campaign is that Ronald Reagan was not business's candidate. Most corporate executives favored John Connally, former Democratic governor of Texas. However, conservatives did not want simply another pro-business administration in the Eisenhower or Ford mold; they wanted a candidate who stood for the retrenchment of the public sector and an offensive against the so-called New Class, social groups that derived power and influence from the activist liberal state. In the end, Reagan was recognized by conservatives as the most suitable vehicle for the implementation of their far-reaching agenda.

Yet the Reagan victory of 1980 was not a mandate for ideological conservatism. Today, even Reagan's greatest admirers would concede that the 1980 election was less a victory for conservatism than a decisive repudiation of Jimmy Carter, whose economic policies were widely regarded as inept. Reagan's agenda was only implemented with the collusion of a coalition of around forty conservative Democrats known as the "Boll Weevils," who voted with con-

gressional Republicans on budgetary and tax bills and stood firmly behind the Reagan administration's aggressive military buildup. Without the support of Southern Democrats like Representative Charles W. Stenholm (D-TX), there would have been no "Reagan Revolution." (Indeed, many Boll Weevils subsequently joined the Republican Party.)

The first Reagan administration was at odds with the public mood on a great many counts; the 1982 midterm elections produced a backlash that clearly demonstrated the unpopularity of the conservative agenda. What enabled conservatism to overcome the 1982 reversal was the economic recovery that began in 1983, maximizing Republican fortunes in the forthcoming presidential elections. Following the Reagan victory of 1984, the somewhat precarious conservative domination of the party was consolidated. At this stage, riding on the crest of an economic upturn and a considerable wave of patriotic fervor prompted by the administration's invasion of Grenada, conservatism became solidly entrenched as the dominant philosophy of the GOP.

Although the Reagan administration pursued few conservative initiatives during its second term (and enacted fewer still), Reagan himself did not forfeit his popularity with conservatives. At the very least, his continuity in office allowed the reforms of his first term to remain unreversed, despite the massive deficits "Reaganomics" brought the country. The same was true of the administration of George H.W. Bush, who acquired the presidency in the 1988 election. At the very least, the Bush victory bought conservatives another four years in which to dominate the national policy agenda.

Conservatism's Gains Under Clinton

Sometime between the second Reagan victory in 1984 and the 1992 election, the conservative movement ran out of steam. Certainly, the fire in American conservatism had faded away once the Cold War ended and the Soviet Union ceased to exist as a rival to American global interests. The Republican Party seemed split by Bush's presidency, and the divisions became apparent in 1992 when conservative columnist Patrick Buchanan, a former official of the Nixon and Reagan administrations, challenged President Bush for the Republican nomination. Although Bush prevailed, Buchanan's maverick campaign contributed to Bush's defeat in the national election. However, while the Republican Party underwent a period of adaptation to the new post–Cold War realities, the Democratic Party carried on the conservative revolution.

The DLC's rightward strategy followed since 1988 seemed vindicated in 1992, when New Democrat Bill Clinton captured the White House from George H.W. Bush. Initially, the Clinton administration embarked on a number of liberal initiatives, notably a major proposal for healthcare reform. But in the space of a few months the hugely popular proposal was vilified and quickly rendered unpopular by a media campaign orchestrated by GOP strategist Grover Norquist, whose concern was that it might turn America into a European-style social democracy. In league with lobbyists from the Christian Coalition, the National Rifle Association, and homeschooling organizations, Norquist represented the Clinton plan as a crisis of "big government" rather than an efficient solution to America's unwieldy and expensive system.

With the failure of his healthcare plan, Clinton changed tack and implemented what David McGowan describes as "the most reactionary agenda of any president in modern history," including hard-line welfare and penal policies. The shift began when Clinton appropriated the issue of crime from the Republicans. By early 1993, the Republican Party had fastened on crime as the issue of public concern most likely to give it an electoral edge over the Democrats. Writing in *The American Spectator* in May 1993, Norquist endorsed the GOP's new preoccupation with crime as sound conservative policy, arguing that it was "an issue on which the Democratic Party is institutionally incapable of following—or even mimicking—the opinions of the American public."

What the Republicans perhaps did not expect was the ability of the New Democrats to successfully appropriate conservative policies. Indeed, Clinton's hard-line policies on crime and welfare were actually tougher than those enacted by the Reagan administration, even though they impacted particularly harshly on black people, who remained among Clinton's strongest supporters. Although the administration of George W. Bush has subsequently implemented an even more reactionary agenda, there is no doubt that it was during the Clinton years that the conservative revolution was "completed" and fully institutionalized. However, Democratic successes in enacting a great deal of the conservative agenda during the 1990s left the Republican Party with nowhere to go except still further to the right. That development first became apparent in the 1994 midterm elections, when the Republican Party bypassed the crime issue for radical social conservatism.

Patrick Buchanan addresses the Republican National Convention in Houston, Texas, on August 17, 1992. An outspoken conservative columnist, Buchanan worked in both the Nixon and Reagan administrations and ran for president in 1992, 1996, and 2000. *(AP Wide World Photos)*

Gingrich and the Contract with America

In response to the Clinton administration's callous but politically adept handling of the crime issue, the Republican Party honed a new conservative platform based primarily on domestic issues. Between 1992 and 1994, under the leadership of Newt Gingrich, the so-called culture wars emerged in anti-Communism's place as the main force fuelling conservative politics. In November 1994, entirely unexpectedly, the Republicans mobilized their highest level of electoral support ever, bringing into existence a GOP-packed House that granted conservatives a rapid round of legislative successes.

Whereas conservatism in the Reagan era was buttressed by foreign interventionism that aroused American patriotism, the conservatism of the 1990s period saw the GOP pursue radical domestic reform of the sort that Reagan would never have dared attempt for fear that it would undermine support for his foreign policy. In this phase, the crowning moment of the GOP's role as the conservative movement's political instrument, the locus of activity was Congress rather than the executive branch, and the man of the hour was the House Speaker rather than the president.

Thanks to resounding victory at the polls in 1994, the Gingrich Republicans were given the opportunity in 1995 to implement a radical package of reforms, the Contract with America, despite the fact that relatively few voters had even heard of the contract when they cast their votes. The Contract with America was a ten-point legislative program whose central features included ending government programs that support the poor, tax cuts, and deficit reduction. The Gingrich Republicans were the most ideologically consistent in Republican Party history: only thirty to forty members of the House and ten to fifteen senators could be described as moderate or centrist. If ever there was a moment at which the conservative revolution can be said to have peaked, therefore, it was during the "First

Hundred Days" of the 104th Congress, which convened on January 4, 1995.

Yet the further the 104th Congress progressed with its Contract with America agenda, the less popular it became. By mid-March, public approval of Congress's performance was waning, back to where it had been before the elections were held the previous November. Since ideological conservatism is unlikely to ever again enjoy the kind of power it wielded between 1994 and 1996, it seems likely that posterity will judge the conservative movement largely on the basis of the American people's less than fully enthusiastic response to the 104th Congress. For the first time in its history, conservatism was in power with what seemed an overwhelming popular mandate. Yet as soon as the conservatives began legislating their agenda into existence, support for Gingrich and his supporters began to fall. Once the full implications of conservatism were spelled out, there took place a liberal backlash when the Republicans were crushed in the 1996 presidential election. Then, in the 1998 midterm elections, the GOP barely held on to its fledgling congressional majority. Indeed, 1998 saw the worst showing by a party not holding the presidency since 1934.

The 1998 result was disappointing for the Republican Party for two reasons. First of all, it suggested that the country as a whole did not stand firmly behind its shift from economic to social conservatism. But perhaps the most serious problem for conservatives was the abstention of significant numbers of evangelical Christian voters. Given the low rates of voter participation in U.S. elections, American elections are largely determined by a political party's ability to rally its base. Since the civil rights era, it has become apparent that the Democratic Party needs the support of black voters to win. Elections that mobilize higher than average numbers of black voters tend to be elections that the Democratic Party wins. (Democratic victories in 1996 and 1998 were largely owed to black support, while the 1994 and 2002 midterm elections went badly largely on account of low black turnout.) The Republican Party is in a precisely analogous position with regard to evangelical Christians, who failed to support the Republicans in their usual numbers in 1998.

Spiritual Allies: The Christian Right

American evangelical Christianity is a natural ally of conservatism for the reason that it is founded on an ideological premise that is compatible with conservative opposition to the activist state. This premise is the Calvinist notion that social activism is either irrelevant or, in a world of reprobates, utterly futile. Conservative Protestants hold that it is presumptuous of human beings to believe that they can devise a better social order than that already in existence. With its inherent bias against attempts to fashion a better society for ordinary people, therefore, conservative Christianity constituted an importance resource for pro-business ideologues like Sun Oil's J. Howard Pew, whose aim was to reverse the trend to liberal governance that had accelerated in tandem with the Cold War.

Along with Texas oil billionaire H.L. Hunt, Pew can be considered as one of the first major conservative philanthropists. Without his substantial investment in the cause, it is unlikely that a conservative revival would have taken place in the 1950s at all. Like many business leaders, Pew was spurred into action by Truman's victory over Thomas E. Dewey in 1948. In the wake of that unanticipated calamity, he used his wealth to bankroll a number of religious groups willing to promote the message that free enterprise was the only economic system compatible with Christianity. In 1950, he contributed $50,000 to finance a new organization, the Christian Freedom Foundation (CFF), led by conservative clergymen Norman Vincent Peale and Howard E. Kershner.

To promote the view that Christianity and capitalism march hand in hand, the CFF published a journal, *Christian Economics*, which was sent to over 175,000 Protestant ministers. *Christian Economics* was largely a platform for the views of the Reverend Carl McIntire, founder of the American Council of Christian Churches (ACCC). A close friend of Federal Bureau of Investigation (FBI) director J. Edgar Hoover, McIntire was a pivotal figure in the emergence of the Christian right. One of McIntire's protégés, the Reverend Billy James Hargis, founded the Christian Crusade in Tulsa, Oklahoma, in 1948. Hargis told his supporters that the Christian Crusade "is the best equipped anti-Communist organization in America to do the titanic job of retrieving our college and high school students to paths of sound, decent, sane Christian-Americanism."

Another McIntire protégé was the Australian psychiatrist Dr Fred C. Schwarz, who founded the Christian Anti-Communism Crusade in Waterloo, Iowa, in 1953. The crusade grew rapidly and became the leading vehicle for American anti-Communism between McCarthy's downfall in 1954 and the foundation of the John Birch Society in 1958. Both Hargis's Christian Crusade and Schwarz's Christian Anti-Communism Crusade targeted American youth and

JERRY FALWELL (1933–)

New Right leader Jerry Falwell was born in 1933 in Lynchburg, Virginia. He did not grow up religious; his father was agnostic, and his grandfather was an atheist and a bootlegger during Prohibition. Falwell converted to fundamentalist Christianity in 1952 as a college sophomore. In 1956, he founded the Thomas Road Baptist Church in Lynchburg, Virginia, where he remains pastor.

Falwell, who studied journalism in college, was a pioneer in the area of religious broadcasting. He started the *Old Time Gospel Hour* radio show in 1956 and expanded into "televangelism" in 1968. In 1971, he founded Liberty University, where he serves as chancellor. In the 1970s, Falwell began to publicly criticize abortion, homosexuality, and pornography, and to promote "family values." In 1979, he founded the Moral Majority. The organization was one of the first religious Right groups to gain national influence in the early 1980s. Using grassroots strategies, the Moral Majority and similar groups are credited with playing a major role in the elections of Ronald Reagan and George H.W. Bush.

Falwell has been at the center of numerous controversies. He often preaches about the moral decay of society and the breakdown of the traditional family, focusing especially on abortion, pornography, and homosexuality. He favors prayer, abstinence-only sex education, and the teaching of creationism in the public schools. Claiming that "secular values are destroying the heart and soul of America," Falwell frequently denounces political correctness, multiculturalism, and relativistic morality. In the 1980s, he suggested that AIDS was God's punishment for immoral behavior. He has often targeted popular culture, complaining about subliminal sexual messages in Disney movies and suggesting that Tinky Winky—a purple children's television character—is gay. His sermons rail against enemies including liberals, secular humanists, and Democratic politicians—especially Bill Clinton.

In 1983, Larry Flynt's *Hustler* magazine printed a parody suggesting that Falwell had sex with his mother in an outhouse. Falwell sued for libel, invasion of privacy, and emotional distress. In 1988, the U.S. Supreme Court ruled against him, stating that freedom of the press allows satire about public figures.

In the late 1980s and 1990s, Falwell and the religious Right as a whole lost much of their political clout and social influence; the Moral Majority folded in 1989. But Falwell remains in the spotlight as a public speaker and talk show guest.

Speaking on Pat Robertson's "The 700 Club" after the terrorist attacks of September 11, 2001, Falwell stated, "I really believe that the pagans, and the abortionists, and the feminists, and the gays and the lesbians who are actively trying to make that an alternative lifestyle, the ACLU, People for the American Way—all of them who have tried to secularize America—I point the finger in their face and say 'you helped this happen.' " Since then, Falwell—who believes that only Christians can be saved and has said that radical Islam is "more dangerous than Soviet Communism and Nazism under Hitler"—has preached unwavering support for President George W. Bush, for the war in Afghanistan, and for the state of Israel.

Liz Highleyman

can be credited with more than a passing role in the emergence of youth conservatism as a prominent feature of American society in the late 1950s.

The Counterculture Awakens a Sleeping Giant

Business's manipulation of religion in the 1950s was an important factor in the early growth of the conservative movement. By about 1960, conservatives were distinguished from liberals not only by antigovernment attitudes but also by more intense religious convictions. (Atheists, chiefly disciples of Ayn Rand, comprised a small, politely tolerated minority.) Although they voted for Goldwater in large numbers in 1964, religious conservatives did not, in the 1960s, field their own national political movement. They tended rather to participate in secular conservative groups like Young Americans for Freedom.

That began to change in the 1970s. What paved the road for the eventual reemergence of the Christian Right were the new perspectives that emerged largely under liberal sponsorship in the 1960s and 1970s. The civil rights movement raised questions in regard to education and affirmative action. Next, the countercultural movement, rooted in opposition to the Vietnam War, called attention to issues important to youth. Then the renascence of the women's movement in the late 1960s prompted controversy over women's reproductive rights and the female role in society generally. Finally, the advent of gay liberation in the 1970s raised the question of whether the state should accord

PHYLLIS SCHLAFLY (1924–)

Phyllis Schlafly has been a national spokesperson for the conservative movement since the publication of her best-selling 1964 book, *A Choice, Not an Echo*, a history of Republican National Conventions. She is America's best-known opponent of the women's liberation movement, having led a ten-year battle that defeated the Equal Rights Amendment.

Schlafly was born Phyllis McAlpine Stewart in St. Louis, Missouri, on August 15, 1924. She graduated Phi Beta Kappa from Washington University in 1944 and in 1945 earned a master's degree in political science from Harvard University. Schlafly also earned a law degree from Washington University in 1978. She worked as a researcher for several members of Congress in Washington, D.C., and participated in the successful campaign of Republican congressman Claude I. Bakewell in St. Louis in 1946. After the election, Schlafly worked in a bank as a librarian and researcher, but she remained active in politics and has attended and played an active role in every Republican National Convention since 1952. She ran unsuccessfully for Congress in 1952 and 1970.

In the 1970s and early 1980s, Schlafly campaigned against the proposed Equal Rights Amendment (ERA). The amendment called for men and women to be given equal treatment under the law. Schlafly opposed the ERA because it would require women to serve in combat, and because she believed it would take away the legal rights of wives and would negatively influence family life. Schlafly claimed that its passage would lead to unisex restrooms and the disintegration of the traditional family structure and women's roles. In 1977, she organized a "pro-life, pro-family" convention in Houston, Texas, as a challenge to the International Women's Year meeting in the same city. Hundreds of women rallied to her call to oppose not only the ERA but also abortion rights, gay rights, and other liberal concepts. She became a leading opponent of the ERA through her lobbying organizations, Stop ERA and Eagle Forum, and by testifying against the ERA before thirty state legislatures. The ERA was defeated in 1982. She also served as a member of the Commission on the Bicentennial of the U.S. Constitution, 1985–1991, appointed by President Ronald Reagan.

After defeating the ERA, Schlafly continued to lead her Eagle Forum organization in campaigns advocating conservative issues, including opposition to sex education and federal funding of the arts, family leave, and day care. She disseminated her opinions through her syndicated column and her radio commentaries. She founded the Republican National Coalition for Life in 1990, which helped draft the uncompromising anti-choice plank in the party's 1992 platform. In the 1990s, Schlafly pushed for child tax credits to be given for each child in the family, and she opposed tax breaks for the costs of child care. She has fought for years to ensure that marriage-penalty relief flows to families with stay-at-home moms as well as two-income households.

During the presidential campaign of 2000, Schlafly expressed concern over George W. Bush's candidacy because she feared he had a soft stance on abortion and chose a running mate tolerant of it. She also spoke out in opposition to the federal and state governments collecting private data on its citizens as an invasion of privacy. In addition, Schlafly wanted to protect or increase parental rights laws that would limit or reduce government and school intrusion into family life. When President George W. Bush proposed a special 10 percent tax break for two-income families in his 2001 tax bill, Schlafly's opposition helped kill the idea.

Schlafly has been a syndicated newspaper columnist for Copley News Services since 1976, and she has served as president of her lobby group, Eagle Forum, since 1975. Since 1967 she has produced a monthly newsletter, *The Phyllis Schlafly Report*, and her daily commentary on social and political issues of the day is heard on forty radio stations. Schlafly is also the author or editor of more than twenty books on subjects as varied as family and feminism (*The Power of the Positive Woman*, 1977), education (*Child Abuse in the Classroom*, 1984), child care (*Who Will Rock the Cradle?* 1989), and nuclear strategy (*Strike from Space*, 1966, and *Kissinger on the Couch*, 1974).

James G. Lewis

homosexual men and women the same civil rights as other Americans, a question that, for traditionalists, was tantamount to asking whether the state should condone the "homosexual lifestyle."

Conservative Christians were angered and powerfully mobilized by the unprecedented display of discontent with traditional morality. For the first time in Western history, perhaps, traditional morality's victims commanded the national stage, while its supporters found themselves on the defensive. This historic reversal was enough to force evangelical preachers like Jerry Falwell to overcome their previ-

ous aversion to religious involvement in politics. By the mid-1970s, polls showed that evangelical Christians were far more active in politics than nonevangelicals, a departure from the situation that had prevailed since the 1920s. National pollster George Gallup declared 1976 "the year of the evangelical," while *Time* and *Newsweek* ran cover stories on the phenomenon.

Finally, in the waning years of the Carter administration, conservative Christians emerged as the shocktroops of a predominantly southern social movement anxious to reinstate the traditional gender order with its central commitments to female subordination and compulsory heterosexuality. What galvanized the movement's shift into political activity at this time was a threat by Jimmy Carter's Internal Revenue Service (IRS) commissioner in 1978 to strip Christian schools of their tax-exempt status. This skirmish between the IRS and the Christian schools ignited resentments that had been accumulating for at least ten years. Major campaigns were waged in support of school prayer and against abortion, sexual education, the Equal Rights Amendment, and the gay liberation movement.

The new religious activism, whose visibility was enhanced by the rise of television evangelism, was eagerly welcomed by mainstream conservatives working to fashion a Republican majority. They saw newly politicized conservative Christianity as a major ally in its campaign to recreate their nostalgic vision of "Middle America." In 1978, therefore, a conscious attempt was made to awaken the "sleeping giant" of conservative Christianity and turn it into a force for funneling evangelical voters to the GOP.

This initiative came from Republican Party strategists Howard Phillips and Paul Weyrich, who persuaded Falwell to found the organization that became known, on Weyrich's suggestion, as the Moral Majority. They promised him support in the form of direct-mail technology, organizational assistance, and leadership training. Falwell began building the Moral Majority by drawing on his connections with fellow Baptist pastors in the Baptist Bible Fellowship denomination. Moral Majority chapters were quickly founded in all fifty states.

The Moral Majority was not the only major organization of the Christian Right to emerge in the late 1970s, however. Although most politically active conservative Christians are women, Concerned Women for America, led by Beverly LaHaye, was the only such organization whose membership was predominantly female. The other four most important conservative religious organizations were Focus on the Family, founded by psychologist James C. Dobson in 1977; the National Christian Action Coalition, which grew out of opposition to President Carter's education policies; Christian Voice, which emerged from the California antigay-rights movement; and the Religious Roundtable, founded by Weyrich and Edward McAteer, which focused on recruiting fundamentalist preachers and their congregations into politics. Although the membership of these organizations was overwhelmingly Protestant, they incorporated a substantial minority of politically conservative Catholics.

In August 1980, the national media "discovered" the Christian Right, which it depicted as the great new force in American politics. Between 1981 and 1984, evangelical support for the Reagan administration rose markedly: in 1984, Reagan won 80 percent of the evangelical vote, the largest shift within an identified social category that had taken place since 1980. Although at the 1984 elections evangelical Christians emerged as the GOP's most consistent supporters—a situation that persists today—it remains unclear whether, on balance, the Christian Right has proven more of a liability than an asset to the party. As moral legislation seems incompatible with a movement professing to emancipate individuals from excessive government interference, the conservative movement has never fully embraced the religious Right's agenda. In addition, the Christian Right itself has been riven by tensions among its different factions, particularly its fundamentalist and Pentecostal wings.

From its inception, the Christian Right has turned off at least as many people as it has attracted. As the 1980s wore on, the nation grew increasingly wary of the movement, especially once President Reagan—who had grown more religious since the attempt on his life in 1981—began talking about Armageddon, which sounded to many ears as if he envisaged a nuclear showdown with the Soviet Union in the immediate future. During the 1980s, the religious Right brought upon the broader conservative movement the kind of opprobrium that had been previously reserved for extremists like the John Birch Society. In the late 1980s, the so-called Gospelgate scandals involving leading televangelists Jim and Tammy Faye Bakker and Jimmy Swaggart dealt a crushing blow to the movement's integrity.

Falwell found the end of the Reagan era a congenial moment to wrap up the Moral Majority and conclude his venture into political activism. By the time the Moral Majority was dismantled in June 1989,

MARION G. "PAT" ROBERTSON (1930–)

Marion G. Robertson, better known as Pat, was born on March 22, 1930, to a political family that claimed Benjamin Harrison, William Henry Harrison, and Winston Churchill as ancestors. His father, conservative Virginia Democrat A. Willis Robertson, served for thirty-four years in the U.S. House of Representatives and the Senate.

As a boy, Robertson attended military school in Maryland and a religious preparatory school in Tennessee. He earned a bachelor of arts degree, majoring in history, from Washington and Lee University in 1950. Despite what he describes as "wild partying," Robertson was made a member of Phi Beta Kappa. In 1948, Robertson joined the Marine Corps as an officer candidate; he later became a first lieutenant and served in Korea. In 1952 he enrolled in Yale University Law School, graduating in 1955.

Despite his accomplishments, by the mid-1950s Robertson had come to feel that his life was empty. Although raised as a Southern Baptist, he had not heretofore been religious. He accepted Jesus Christ as his savior in 1956. Robertson, feeling he was called by God to become a minister, earned a master of divinity degree from New York Theological Seminary in 1959.

With no television experience, Robertson founded the Christian Broadcasting Network in 1960; he continues to host its best-known program, *The 700 Club.* In 1978, Robertson started the humanitarian aid organization Operation Blessing International, and in 1990 he founded Regent University.

In 1987, Robertson declared his candidacy for president. The key themes of his campaign included the war on drugs, the national debt, anti-Communism, the breakdown of the American family, and the need to return God to the classroom. Robertson addressed the 1988 Republican convention, famously branding Democratic opponent Michael Dukakis "a card-carrying member of the ACLU." Robertson spoke of two opposing visions of America, a theme echoed at the 1992 convention with Patrick Buchanan's declaration of a "culture war."

Although he lost the nomination to George H.W. Bush, Robertson did not leave public life. In 1989, he founded the Christian Coalition. Robertson described the group's mission as being "to mobilize Christians—one precinct at a time, one community at a time—until once again we are the head and not the tail, and at the top rather than the bottom of our political system." The organization was among the religious Right groups that successfully pioneered direct-mail outreach and influenced politics by running candidates for local offices such as school boards. In 1990, Robertson formed the American Center for Law and Justice (ACLJ), a legal organization focused on issues such as fighting abortion and gay antidiscrimination laws. Over the years Robertson has authored several books, including *The New World Order* (1991).

By the end of the century, the religious Right's political influence had substantially declined. Robertson was widely criticized for a 1992 fund-raising letter in which he claimed, "The feminist agenda is not about equal rights for women. It is about a socialist, anti-family political movement that encourages women to leave their husbands, kill their children, practice witchcraft, destroy capitalism, and become lesbians." In 2001, Robertson was denounced for agreeing with Jerry Falwell that pagans, abortionists, feminists, gays and lesbians, and civil liberties activists were to blame for the terrorist attacks of September 11. In December of that year, Robertson resigned as president of the Christian Coalition to refocus on his ministry.

Liz Highleyman

conservative Christian organizations had not achieved any of their major objectives. A commonly cited index of their failure is their lack of success in shifting public opinion against abortion. By 1989, support for the anti-abortion position was only a couple of percentage points higher than it had been in 1979—while support for abortion on demand was significantly higher. At this stage, the Christian Right's only real achievement lay in its voter registration drives, which probably netted the GOP several hundred thousand new supporters in time for the 1984 presidential election.

The Second Coming of the Christian Right

The newly politicized Christian Right was not about to shrink from the scene so quickly, however. In 1989, the Reverend Marion "Pat" Robertson founded the Christian Coalition of America (CC) on the basis of mailing lists he had generated in the course of his unsuccessful 1988 presidential campaign. The CC, whose membership soon reached 350,000, instantly replaced the Moral Majority as the religious Right's flagship organization, leading some commentators to speak of the Christian Right's "second coming."

This time around, the emphasis lay on cultivating a stronger grassroots constituency and cooperating with mainstream political organizations. Most important, there was a new emphasis on damage control. Working on the venerable American assumption that there is no cause so unpopular that it cannot be salvaged by public relations, the CC played down Pat Robertson's headship and promoted instead "baby-faced," ostensibly moderate Ralph Reed as its primary spokesperson. Although Reed's record as an aggressive anti-abortion activist in the mid-1980s suggests that his real views are far from moderate, his prominence in the CC reflected the movement's new emphasis on refashioning its public image while working toward its goals by more sophisticated means. The CC also adopted new methods of bringing its message to the American people, including "mainstreaming," or the avoidance of biblical language in favor of liberal "rights" rhetoric. Reed also identified the CC with the use of stealth politics: concealing the organization's real agenda behind less controversial policies. "It's like guerrilla warfare," he told *The Los Angeles Times* in March 1992. "If you reveal your location, all it does is allow your opponent to improve his artillery bearings. It's better to move quietly, with stealth, under the cover of night."

In its second incarnation, the Christian Right soared higher, but finally plunged lower, than it ever had in the 1980s. In the lead up to the 1994 elections, the new Christian Right seemed an almost unstoppable juggernaut. In November 1994, 60 percent of the 600 candidates for local, state, and national office for which the CC had declared its support were elected. As about a quarter of the newly elected members of the House were affiliated with evangelical churches, Christian conservatives attained an unprecedented degree of legitimacy and influence in American politics during the 104th Congress. Gingrich even announced that a constitutional amendment allowing student-led prayers in public schools—a measure for which Christian conservatives had looked in vain to the Reagan administration—was likely to come before the House after the 1995 Easter recess.

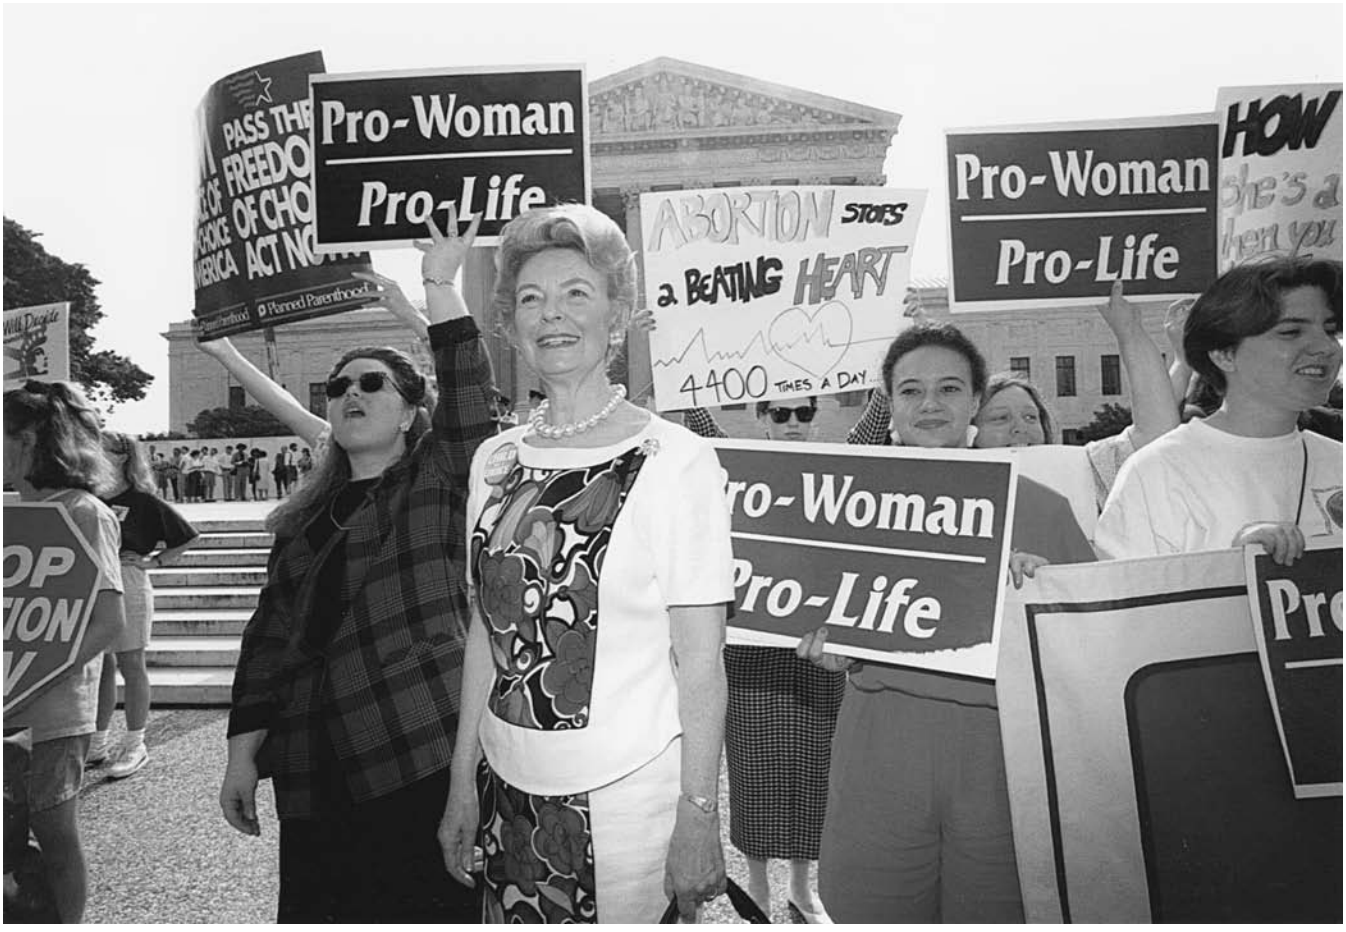
Yet the CC's blaze of glory was short-lived. Although the huge Republican majority in Congress after 1994 promised attention to the issues conservative Christians cared about most, by 1996 it was clear that conservative Christians had achieved no more under Gingrich than they had under Reagan and George H.W. Bush. Gingrich's Contract with America avoided controversial social issues such as gay rights and abortion. The failure of the most conservative Congress elected in modern times to pursue policies sympathetic to the religious Right precipitated the CC's decline. In the wake of a stillborn initiative that aimed to extend the contract into "family values" territory—the Contract with the American Family—Reed left CC to work for Enron Corporation in 1997, and the organization soon forfeited much of its political clout.

Confrontation and Conciliation with the GOP

With the demise of the Moral Majority and the parlous state of the post-Reed CC, the largest and most important organization of the religious Right today is, with an annual budget of $150 million, Focus on the Family (FF). FF, which operates out of a 75-acre complex in Colorado Springs, Colorado, was founded by Dobson as a support organization for his radio program of the same name. His half-hour program is heard by 2 million people on 4,000 stations across the country, an audience that is said to be exceeded on radio only by Rush Limbaugh, Paul Harvey, and Laura Schlesinger. Dobson has never aspired to the high public profile cultivated by Falwell, Robertson, or Reed, preferring instead to exercise his influence behind the scenes. FF's Washington lobby group, the Family Research Council (FRC), was headed by Gary Bauer until January 1999. Although during his time with the FRC, Bauer was cited by many as the most important voice of the religious Right, he effectively burned his bridges when, during the 2000 primaries, he endorsed Senator John McCain (R-AZ), an unpopular figure among religious conservatives.

With an annual budget of $14 million, the FRC is financed by the DeVos family (Amway Corporation) and California millionaire Howard Ahmanson. Although like the CC, it places an emphasis on grassroots organizing, FF is more openly theocratic in its outlook. Dobson insists that "scriptural principles . . . must again be brought to bear on every aspect of life, including education, government, and law." Even more single-mindedly than the Moral Majority and the Christian Coalition, FF and the FRC are characterized by extreme antipathy to homosexuality. FF opposed what they characterized as "The Homosexual Agenda"and participated in the May 1994 conference in Colorado Springs at which the essential outlines of the Christian Right's current antigay offensive were laid down.

In the 1996–1998 period, Dobson was one of the leaders of a showdown between the religious Right and the GOP that, in the end, created the most "religious Right-friendly" presidential administration so far. In February 1998, Dobson declared that the Re-



Pro-life supporters demonstrate on the steps of the Supreme Court building on June 29, 1992. Few issues galvanized conservatives in the late twentieth century more than abortion. Standing in the foreground is Phyllis Schlafly, one of the nation's most prominent conservative activists. *(AP Wide World Photos)*

publican Party had "betrayed" Christians by neglecting the Christian Right's social agenda. He condemned Gingrich for failing to deliver important legislative items such as the Religious Freedom Amendment and for allowing a pro-choice Republican to address the party's 1996 National Convention. He made similar statements to the Southern Baptist Convention, when it met in Salt Lake City in June 1998. It seems highly likely that Dobson's position kept religious conservatives away from the polls the following November, when the proportion of voters who identified with the religious Right fell to 20 percent (down from 30 percent in 1994). Although religious Right leaders professed to be disappointed by the 1998 result, which was indeed a poor one for the Republican Party, the result was victory of a negative kind. It forcefully reminded the GOP of the substantial risks it ran by alienating its conservative Christian constituency.

The apparent eclipse of the religious Right in the last five years seems to be partly a function of its dwindling financial base. Despite the widespread assumption that all rightist groups draw upon almost infinite financial resources, conservative philanthropists like Richard Scaife have never given generously to groups like the Moral Majority and the CC, while the pool of ordinary people willing to do so seems just about to have dried up. But the main reason that the religious Right seems weak and demoralized today is the conservative movement's failure to bring down President Clinton over a series of moral scandals that lasted virtually for the duration of his two-term presidency. Clinton's unexpected ability to marshal high levels of public support throughout the Monica Lewinsky scandal shattered the Christian Right's confidence that the nation could be brought "back" to Judeo-Christian morality. In a despairing

1999 statement, Weyrich, whose disillusionment with the conservative movement dates back to at least 1996, suggested that conservatives would be better off "dropping out" and forming their own Christian counterculture than trying to reform the dominant culture. "I know that what we have been doing for thirty years hasn't worked, that while we have been fighting and winning in politics, our culture has decayed into something approaching barbarism," he declared.

It would be inaccurate, however, to claim that religious conservatives no longer seek to promote a national agenda and no longer wield considerable power in the GOP. Even in the absence of a high-profile media figure like Falwell or Reed, the well-heeled Christian Right continues to exert formidable, behind-the-scenes influence—especially regarding such issues as abortion, school prayer, abstinence education, and others—on the legislative process, the court system, and the administration of George W. Bush.

Conservatism and the American People

Conservatism was essentially a social movement of a small minority of elitist intellectuals whose ideas would never have played a major role in American society had they not been made the "official" ideology of the Republican Party. Yet it is hard to deny that large numbers of Americans have proven receptive to the conservative message. Indeed, it would be difficult to imagine a situation in which conservatism could have reached its present degree of political importance without the support of at least a strategic minority of the American electorate.

A common explanation for the rightward turn of the last twenty-five years is that constituencies alienated from liberalism grew larger over time until eventually they composed a real majority. Evidence of a backlash against liberalism can be detected as early as 1965, when support for the civil rights movement began to falter. While Americans accepted the justice of conferring civil rights on the country's African-American population, most balked at the far-reaching policies required to bring about "equality as a fact and as a result," in the immortal words of President Johnson. However, it was only in the wake of the violent upheavals provoked by the Vietnam War that conservatism began to look as if it could triumph. The Nixon win in 1972 is sometimes depicted as the first major conservative victory, albeit one whose momentum was squandered shortly afterward by the Watergate debacle. Others argue that the loss of the war in Vietnam was crucial. In *The Strange Death of American Liberalism* (2001), for example, Cold War historian H.W. Brands maintains that the loss of the war in Southeast Asia, combined with Watergate and subsequent revelations about the iniquities of the Central Intelligence Agency and the FBI, created a downward spiral of disillusionment that ended with the repudiation of liberal governance itself. Others see the crisis-ridden Carter presidency as the moment of liberalism's final rout.

Whichever narrative of liberal decline one favors, however, the underlying premise is that the conservative capture of the executive branch in 1980 was the culmination of a massive groundswell of support for ideological conservatism that had been growing since the late 1960s. By electing Reagan, the American people can be seen as decisively rejecting liberalism and endorsing the New Right's crusade to dismantle big government, lower taxes, scale back the welfare state, and overturn regulations with adverse impacts on profits.

The problem with the thesis of a grand repudiation of liberalism by the 1980s is that political scientists and public opinion analysts have turned up little evidence to support it. That the much-vaunted turn to the right was a myth was first demonstrated in 1986 by Thomas Ferguson and Joel Rogers, who found that "the basic structure of public opinion in the United States has remained relatively stable in recent years." The most comprehensive research available, Tom W. Smith's 1990 study of 455 attitudinal indicators, shows that attitudes have remained more or less steady since liberal growth leveled off around 1974. (Small shifts here and there in a conservative direction have been compensated for by other shifts in a more liberal direction.) James A. Davis's 1992 study of forty-two General Social Survey items came to similar conclusions, averring that "even the much-maligned younger generation is not very conservative."

Initially, it would seem hard to reconcile the view that Americans are overall (i.e., when examined on a wide range of social and economic issues) not less liberal than they were in the 1970s with the fact that an unambiguously conservative party, the GOP, has dominated national politics for more than twenty years. Nonetheless, Republican electoral ascendancy was not the consequence of growing support for con-

servatism so much as an epochal shift in conservative voting strategies. One of the most unusual features of the postwar American electoral landscape was a direct legacy of the Civil War. Thanks to its role in bringing down slavery, the GOP never enjoyed the support of more than a small minority of southern voters for nearly a century. However, once the Democrats became identified with the civil rights movement (and liberal positions on welfare and other social issues), young southern white males began deserting the Democratic for the Republican camp.

At first, the movement was a gradual one. Despite gains made by Republican candidates in the 1952, 1954, and 1956 elections, the South still supported the Democrats at much higher levels than the rest of the country. The real break with tradition came with the unprecedented success of Barry Goldwater, the first GOP presidential candidate to associate himself with opposition to civil rights. The impact the Arizona senator had on the South has been described as "amazing." According to Donald S. Strong, "Here was a man whose restrained and reasoned opposition to civil rights legislation would have kept him from being elected sheriff in Alabama or Mississippi. Yet the electorate of the Deep South immediately perceived him as the white man's candidate and swept him to victory in the five states of the Deep South." (Indeed, the Deep South was the only part of the country that he carried.) Yet Goldwater's success in the Deep South was a one-off episode; it was in the marginal South that the GOP made its most substantial progress—the traditionalist states were the last to overcome their century-old aversion to the party of Abraham Lincoln.

Southern reaction against the Voting Rights Act of 1965 and other civil rights initiatives sponsored by President Johnson set the scene for Nixon's racially inflected "Southern strategy" that overturned the Republican Party's identification with ending slavery. Although Goldwater had precipitated the defection of 19 percent of self-described Democratic voters, Nixon did even better. Thirty-nine percent of Southern "Democrats" voted for him in 1968 and 54 percent in 1972. The real locus of change since the 1970s, however, has been subpresidential contests. Many southerners who voted for Nixon continued to think of themselves as Democrats (or as Independents) and to vote for Democratic candidates in congressional, state, and local elections until the late 1970s. As recently as 1972, only 13 percent of native white southern voters identified themselves as Republicans. But once dissatisfaction with conservative Democrat Jimmy Carter infected the South, the result was a rapid rise in Republican identification.

Since that time, the shift to the GOP has been dramatic. According to Alan Abramowitz and Kyle Saunders, between 1978 and 1994 southern white males from Democratic families moved heavily into the GOP, reflecting that party's standing as a clear bastion of racial and social conservatism. (Although this realignment of voter preferences has partly been compensated for by a shift of liberal Republicans to the Democratic Party, this group is only about half as big.) In 1980, 1984, and 1988, the GOP won all the South's electoral votes—meaning that they needed only one-third of the electoral votes in the rest of the country to be successful. The shift peaked in 1994, giving rise to a Republican-dominated Congress for the first time since 1952. In the 1994 congressional elections, the Republican Party became for the first time ever the majority party in the South. With a 59 percent share of the vote, the party snared 51 percent of the region's seats in the House and 59 percent of those in the Senate.

Today, the Republican Party commands its highest support in the South—a situation that was unthinkable when V.O. Key published his classic study *Southern Politics in State and Nation* in the late 1940s. From an average of about 16 percent in the 1960s, the white southern vote had reached 59 percent by the 1990s. Although political strategist Kevin Phillips had forecast the advent of a "Republican majority" in the South as early as 1969, it actually took another twenty-five years before the GOP became the region's dominant party. This development—the end of a historical anachronism—is the core development enabling conservative hegemony in the United States today. There is little about the conservative hold over American political institutions that is not primarily attributable to the southern shift. Indeed, there has been no growth at all in the Republican vote outside the South, where the GOP's share of the congressional vote has actually been falling gently over the entire postwar period.

Their continuing failure to comprehend the full significance of the southern shift has led some political scientists to draw inaccurate conclusions as to the social sources of the current Republican ascendancy. Around 1980, analysts first discerned the emergence of a "gender gap" in regard to support for the two major parties. Beginning in 1964, they noted, males seemed increasingly attracted to the GOP. By 1996, when females voted for Clinton more than males by

a 14-point lead, the gender gap had emerged as a central insight into the nature of the conservative shift in politics. But while no one can deny the existence of a very substantial gender gap within the white population—after all, only 36 percent of white males voted for Al Gore in the 2000 presidential election—those who emphasize the significance of the gender gap often fail to take into account the importance of the southern factor. The gender gap is largely a statistical reflection at the national level of the fact that since 1964 southern white males—conservatives who had formerly voted for the Democratic Party—have been breaking away from the Democrats to vote for a conservative party.

Today, in fact, most southern white males vote for the GOP. Although the southern shift to the GOP began with upper-income groups, by 1994 the trend had incorporated the overwhelming majority of southern white males regardless of economic status. Today, most southern white males vote for the GOP. In 2000, for example, George W. Bush received fully 70 percent of the southern white male vote, while his rival, Gore, managed a paltry 27 percent. If the southern states were abstracted from national data, the gender gap would be almost entirely eliminated.

The conservative victories of 1980, 1984, 1988, 1994, and 2000, therefore, were not the products of a broad popular mandate for conservatism, but opportunities created by a large-scale shift of conservative southern white males from the Democratic Party to the GOP. But if Americans *en masse* have not grown discernibly more conservative over the last twenty-five years, conservatives have certainly curbed liberalism's growth. For the moment, at least, Americans have suspended belief in government's ability to enact the liberal vision of a more democratic and more fully participatory society by means of federally funded social programs. It seems clear enough, therefore, that the right-wing political ascendancy has little to do with the changing political preferences of the mass of Americans.

Women and the Conservative Movement 1933–Present

Although women are usually considered liberal because of their much-publicized affiliation with groups such as the National Organization for Women and SANE, women have also numbered among conservatives. The influence of conservative women on government policy has actually been significant since World War II.

Conservative women, like their liberal counterparts, are often difficult to characterize: Novelist Ayn Rand, an atheist, would recoil from Phyllis Schlafly's religious-based conservatism; while the female émigré writers of *National Review* would shrink from the anti-Semitism of the Mother's movement. Nevertheless, conservative women can be grouped according to a core set of beliefs: a fervent anti-Communism, a general distrust of the government (which, in the mid-twentieth century, was tied to their libertarianism and their anti-Communism in that they believed that government was either soft on or in the employ of Communism), and a support of free enterprise.

A visit to the Soviet Union activated Elizabeth Dilling into anti-Communist activism. In the early 1930s, Dilling became obsessed with researching and cataloging every Communist and pro-Communist organization in America. The result of her research, *The Red Network: A Who's Who and Handbook of Radicalism for Patriots* (1934), listed, among others, Mahatma Gandhi, H.L. Mencken, and President Franklin D. Roosevelt and First Lady Eleanor Roosevelt as Communists. Dilling expressed both her anti-Semitism and her hatred of the Roosevelt administration in her coining of the term *Jew Deal*. Dilling's notoriety as a lecturer on anti-Communism brought her into the previously all-male orbit of Huey Long, Father Charles Coughlin, and aviator Charles Lindbergh—all anti-Communist opponents of the New Deal.

Dilling would form the nucleus of the World War II–era Mother's movement. As America moved out of the Great Depression and into confrontation with the Axis, some conservative women of the Fascist variety would oppose Roosevelt's policies against Adolf Hitler. Like nineteenth-century feminists, these women would employ maternalist arguments as a political weapon against the state. The Mother's movement, originating in California in 1939 and then spreading to both coasts and the Middle West, used the time-honored tactics of other women's groups in articulating its position: its members testified before Congress, picketed the White House, and collected petitions. The group's opposition was not based on the fact that men were in charge—its members accepted it as "natural" that men should lead; rather, it was based on the notion that the *wrong* men were in charge. Highlighting their role as mothers, Mother's movement proponents argued that they owed it to their sons' safety to make sure that the right men were in leadership positions. They accepted Hitler's characterization of the Jews as the leaders of a worldwide conspiracy and applied it to American history (maintaining that the Jews caused the Civil War, invented Communism, and were plotting to destroy Christian, capitalist America through the New Deal).

The movement's peak power developed during the debate over Lend-Lease, in which President Franklin Roosevelt gave military aid to Great Britain when England was under aerial attack by Nazi Germany. Against aid to Great Britain, the Mother's movement was able to hinder President Roosevelt's ability to move as quickly as he would have liked in aiding the Allies. Most of the groups disbanded after Pearl Harbor, but a few remained, actively resisting the war and calling for a negotiated peace that would have left Hitler and Hirohito, emperor of Japan, in power. The hard-core members of these groups never believed that the war against the Axis was justified, even after revelations of the Holocaust. The group did not last through World War II but was ultimately dismantled by internal fighting and the brown scare in-

vestigation campaign against supporters of Fascist Germany, in which the federal government prosecuted many of them for possible treason and Axis sympathies in 1944.

As Cold War tensions heightened between the United States and the Soviet Union in the postwar period, several notable women would come forward as government witnesses. Usually, these women were born-again conservatives, having spent the previous decades as Russian espionage agents.

A significant, and highly credible, government witness, Elizabeth Bentley was partly responsible for the postwar Red Scare, in which the House Un-American Activities Committee, a congressional investigatory body, investigated possible Communist sympathies in Hollywood and the federal government in the late 1940s and early 1950s. A Vassar graduate, Bentley gravitated toward the Communist Party in the mid-1930s and eventually toward espionage by World War II. Her contact with several New Deal officials who were doubling as Communist spies would have important domestic repercussions in the postwar period, helping form the backbone of the Republican Party's platform charge of "Twenty Years of Treason"—a slogan emphasizing President Roosevelt's complicity or ignorance in allowing Communist agents to shape government policy. Bentley's testimony implicating Lauchlin Currie, special assistant to President Roosevelt, and Harry Dexter White, former assistant secretary of the Treasury, as Soviet spies would be validated in the 1990s by declassified secret Soviet cables. Bentley's description of her life in the Communist Party highlighted its misogynist nature, its feminist rhetoric to the contrary, by describing its demands that female members use sex as a recruiting tool.

Freda Utley was a British professor and Comintern worker until her husband was imprisoned in a Soviet concentration camp. An expert on the Far East, Utley wrote a series of books about Soviet intentions in the Far East. She came to prominence in the late 1940s when the Republican Right charged the Democrats with having "lost" China to the Reds. Her testimony before the government provided Red hunters with an authentic intellectual for their thesis that the New Deal was soft on Soviet expansion into China.

Ayn Rand combined government testimony with literary explanations of her philosophy. Known as objectivism, Rand's philosophy extolled individualism and self-interest as the only original ideas in the world. Her protagonists are creative and rational and deserve to profit from their ideas. Unlike most conservative women, Rand rejected religion. Rand was born in St. Petersburg, Russia. She moved to the United States in 1926 and became a U.S. citizen in 1931. Her novels *We, the Living* (1936) and *Anthem* (1938) reflect her early life in Russia. Both novels express her revolt against Socialist forms of government. Rand also expressed her philosophy in such works of nonfiction as *For the New Intellectual* (1961), *The Virtue of Selfishness* (1965), and *Capitalism: The Unknown Ideal* (1966).

In the 1950s, several conservative women gravitated to William F. Buckley's *National Review*—Buckley's magazine forum for respectable conservatism. Some, like Suzanne LaFollete, were former radicals. (She was part of the committee to defend Leon Trotsky in the 1930s against the Stalinist Purge Trial allegations, in which Soviet leader Josef Stalin prosecuted thousands as part of an alleged Nazi-sponsored conspiracy against his government.) Others, like Buckley's sister Priscilla, were lifelong conservatives. It would be difficult to homogenize *National Review* into one message, but these women shared in the magazine's firm stand against the Soviets and its championing of free-market values.

Many of these women supported the anti-Communist crusade of Senator Joseph McCarthy (R-WI). LaFollete and Utley even signed petitions condemning his censure by the U.S. Senate. But not all conservative women supported the senator's efforts. Still others, like Senator Margaret Chase Smith (R-ME), attempted to mount a condemnation of his methods, while still asserting that the Democrats were soft on Communism.

Conservative women in the 1960s gravitated to the presidential campaign of Barry Goldwater. Rand, LaFollete, Utley, and others (including Hillary Rodham, the future wife of President Bill Clinton) then called themselves "Goldwater Girls."

The appearance of the 1960s counterculture and the perceived permissiveness toward law and order under Chief Justice Earl Warren's U.S. Supreme Court caused many former Democrats to become more conservative in the late 1960s and 1970s. These "neoconservatives" declared war on the excesses of the 1960s. Gertrude Himmelfarb, a Democrat and academic, helped mount a "Democrats for Nixon" campaign in 1972, while Midge Decter help found the Coalition for a Democratic Majority, an organization dedicated to moving the Democratic Party away from the New Left.

Attempted passage of the Equal Rights Amendment to the U.S. Constitution in 1974, which would call for men and women to be treated equally before the law, mobilized Phyllis Schlafly into action. A lawyer by vocation, Schlafly founded Stop ERA Now in 1972 and was instrumental in keeping the amendment from being legalized. In 1975, she founded the Eagle Forum, a group that supported the traditional role of women in society.

Disillusionment with the Carter administration's foreign policy and the seemingly unstoppable advance of the Soviets in the Cold War led Jeanne Kirkpatrick to break with the Democratic Party and to accept a position as U.S. ambassador to the United Nations under President Ronald Reagan. Several prominent women served in the Reagan administration, among them speechwriter Peggy Noonan. These neoconservative women would help form the Council for the Free World Society, a foreign-policy think tank.

In the 1990s and beyond, conservative women continue to make their influence felt. In her battle with academic political correctness, Himmelfarb has helped found the National Association of Scholars, a group of academics that seeks to reclaim colleges from New Left dogmas.

Post–Civil War Nativism Movement

The 1830s and 1840s in the United States saw the emergence of a set of attitudes and a first upsurge of organizations in which they took shape. Its adherents, believing the American republic imperiled by alien influences, discussed and proposed steps to counteract the alleged subversions and to promote their concept of Americanism as the only true and legitimate one. In order to describe this phenomenon, its critics in the 1840s coined the term *nativism*. Since that time, contemporaries and scholars have arrived at numerous definitions, evaluations of nativism and its impact on American society, as well as diverging opinions on the time span of its existence. The term has been used to refer to a set of popular ideas common in a great variety of periods and peoples, to describe a frame of mind existent solely in the United States since the late eighteenth century at least, or, only in the century beginning in the 1830s, or, even more specifically, to denote forms of organized activism that influenced American society from the 1830s to the 1920s.

For this reason, a clarification of the term's meaning has to precede any closer look at nativism in a certain period. Since the phenomenon did not emerge, exist, and decline isolated from contemporary transformations, such a look needs to take in the political, economic, demographic, and social conditions as well as related ideas of Americans at a given time. The following exposition of nativism in the decades from the end of the Civil War to the late 1920s is based on a sketch of the most important definitions of the phenomenon. It highlights continuities and changes of nativism as a set of ideas and an activist movement in three phases: from the 1860s to the 1880s; from the 1880s to World War I; and in the postwar decade.

The Meaning of Nativism

As the word suggests, nativism connotes a qualifying of and preference for those who are deemed natives and a definition of and hostility toward those thought of as foreigners. In its broadest sense, its meaning is akin to that of the term *xenophobia*, describing an opposition to foreigners and foreign-born members of internal minorities to be found in any society at any time during the history of humanity. More particularly, the word is utilized to delineate specific attitudes and acts of Americans to achieve two main goals: The first is to develop and strengthen a distinctive American "national character" or peoplehood; the second, closely connected to the first, is to restrict, exclude, or attack the foreign-born as "un-American" and therefore as a threat to the nation. Seen in this light, nativism has been an undercurrent in American society from at least the Declaration of Independence up to the present day. Four elements run through the various forms and stages of nativism as understood in this sense: (1) certain immigrant groups have been seen as cultural or racial others, different from the earlier immigrant generations from northern and western Europe; (2) it has been assumed that members of the supposedly inferior groups could never completely assimilate to the Anglo-Saxon culture defined as the mainstay of the nation; (3) economic crises have boosted the supposition that the immigrants would bring about a deterioration of economic conditions for the native-born; and (4) the immigrants have allegedly come from an inferior political culture, so that their political activities corrupt the supposedly flawless political system of the United States.

As a distinct historical phenomenon, nativism may more narrowly be defined as the "intense opposition to an internal minority on the grounds of its foreign (i.e., "un-American") connections." It emerged in the 1830s in New York, led to the Know-Nothing movement of the 1850s, acquired a new mass popularity in the 1880s and 1890s, and saw a final apogee in the decade after World War I. As John Higham, concentrating on the nativist "state of mind," points out, nativism grounds in broader cultural antipathies

and political ideologies and turns them into a zeal to destroy those deemed enemies of a distinctly American way of life. Even more narrowly interpreted, the term may be applied only to organized nativist activism "directed at aggressively creating and shaping American 'national character.' " Organizations committed to this goal began to spring up in the 1830s. Most of them declined in the late 1850s, but some revived after the Civil War. Beginning in the late 1880s, new organizations emerged in a phase of renewed nativist appeal. The demise of organized nativism in its specific form since "Know-Nothingism" came in the years of the Great Depression.

American nativism in the roughly 100 years after 1830 was both a set of attitudes and a form of organized activism. The element shared by organizations from the American Party of the 1850s to the Ku Klux Klan of the 1920s was a common vision of alien intruders in the country of true liberty said to threaten America's uniqueness. Its main themes, stressed to varying degrees by individuals and organizations throughout this time span, were: (1) a strong anti-Catholicism, with a political as well as a social and moral thrust; (2) an anti-radicalism as a legacy of the late eighteenth century, flexible enough to include groups and ideologies as diverse as the German Forty-Eighters, the Anarchists of the late nineteenth century, and the Bolsheviks of the twentieth century; and (3) a specific form of racism that started out as a praise for traditions and love of freedom supposedly innate in Anglo-Saxons. In the decades following the Civil War, it was transformed into a feeling of racial superiority and a discrimination and persecution of minorities on the basis of features attributed to race. The stereotypes of immigrants as members of an inferior culture and as an economic burden were, in some, though not all instances, linked to this racist stance.

Nativism from the 1860s to the 1880s

The Civil War ushered in a period of unprecedented agricultural, industrial, geographical, and demographic growth in the United States. The westward thrust and an accelerated industrialization attracted millions of immigrants, as a precondition to American expansion in the postwar decades. Immediately after the war, immigration rates began to rise again, though hostilities had not completely interrupted the flow of immigrants to the United States. With more than 2.8 million newcomers in the years 1871 to 1880, the statistics of the war decade had only been excelled by half a million. In marked contrast, the ten years after 1880 saw a floodtide of 5.2 million new arrivals. Most of the immigrants disembarking until late in the 1880s came from Britain, Germany, Ireland, Scandinavia, and other countries in northern or western Europe. Encouraged to come by businessmen and states and welcomed by the federal government, they settled according to patterns established by their compatriots who had arrived earlier. The newcomers' regional distribution, too, followed established patterns.

Asian immigration to the United States began in mid-century with a relatively small number of arrivals from China. By 1865, there were no more than 60,000 Chinese in America. Of the 300,000 Chinese in the late 1870s, only 105,465 remained to be included in the census of 1880. Japanese immigration took even longer to exceed minimal numbers. In 1890, little more than 2,000 Japanese resided in the United States. Whereas by 1880 federal legislation had imposed restrictions on immigration only on the grounds of loosely defined moral or social categories, no group of immigrants had been excluded specifically by national origin. The Chinese Exclusion Act of 1882, suspending immigration from China, changed this picture.

Attitudes

In an age of continuous industrial growth, the views of native-born Americans on immigration depended largely on economic considerations. Social problems were often ignored, so that new arrivals were evaluated mainly in economic terms, that is, welcomed as the basis for national and individual prosperity. On the whole, faith in assimilation of the newcomers prevailed, although a considerable part of the new arrivals belonged to the very groups that had been targeted by the Know-Nothing movement in the prewar years, that is, the Germans and the Irish.

Stereotypes of Germans and Irish, and suspicions as to the political reliability of foreign-born generally, did not altogether disappear during the conflict, when immigrant groups answered the call to arms just as the native-born majority did. In fact, the war held opportunities for interethnic and Catholic-Protestant friction, just as well as for sympathy and appreciation of the commitment shown by the more recent Americans. Rather, old stereotypes survived into the decades following the war, some having even been exacerbated, to form the background of anti-alien dislikes and anxieties.

For several reasons, the most intense sentiments

were directed toward Irish immigrants and their children. First, the Fenian movement and its activities in the United States aroused fears of organized "un-American groups." They seemed a danger to the nation's political life, and as a supposedly well-organized movement, a direct challenge to the predominance aspired to by nativist organizations themselves. Second, as Irish Americans became more closely involved in the urban political machines, nativists predicted a loss of power for those held to be the backbone of American nationality, the white, Anglo-Saxon Protestants. Third, anti-Catholic sentiment remained a strong undercurrent, so that Irish Catholics seemed doubly resistant to attempts at "Americanization," politically loyal to their country of origin, and loyal to priests, bishops, institutions, and practices that transcended national categories. Fourth, times of economic depression such as the years 1873 to 1877 heightened sentiment against immigrant labor and even more so immigrant labor organizations such as the rather obscure Irish "Molly Maguires" in Pennsylvania. Irish labor unrest—all labor unrest of foreign-born—–was by definition organized unrest and therefore the more dangerous. And finally, the older notions of a predisposition to alcohol and leisure, supposedly typically Irish and conspicuously "un-American," prevailed in the late nineteenth century.

Similarly, immigrants and Americans of German descent achieved little in getting rid of the negative attributes ascribed to them as a group. They fared a little better than the Irish, since a considerable part of them were Protestants. As did the Irish, German immigrants stood for self-indulgence and drunkenness; to be more exact, for excessive beer-drinking, for bad manners, and for dullness, and thus for elements of a culture classified as foreign. The activities of German immigrants in labor unions were considered as detrimental to "true Americanism" as those of the Irish.

Although anti-Irish or anti-German sentiment occasionally escalated into acts of violence against individuals or groups, the antipathies against European newcomers of the 1860s to 1880s never reached the aggressiveness directed toward Asian immigrants, particularly Chinese newcomers, most of whom were brought into the country as contract laborers. The act of 1882 only marked the climax of the legal assault on the Chinese, preceded by tirades and acts of violence occurring increasingly in times of economic crises. To nativists, Chinese and Japanese immigrants represented a totally alien culture: they could never be turned into "Americans."

Organizations

Nativist stereotypes and fears outlived the war years, as did the institutional core of the prewar movement. The economic and social transformations of the two decades following the Civil War created a climate favorable to a renewal of nativist activism. As in the 1840s and 1850s, fraternities met with the greatest success. They supplied their members with a wide range of attractions, utilitarian as well as ideological. These attractions included an unambiguous statement of what was native and what was foreign, the integration into an organized network, and, highly important, benefits in the line of friendly societies, mostly along the mutual assessment principle.

The organizations that had survived from the heyday of Know-Nothingism could lay claim to the greatest popularity within the movement up to the 1880s. The American Protestant Association, popular among Protestants of Scottish or Irish descent, profited from the rise of the Orange Order in the United States. The Order of the United American Mechanics (OUAM) and its Junior Order, established in the 1840s and 1850s, respectively, could boast an increasing membership in the 1860s. The Junior Order added an antiradical stance to its anti-immigrant agenda in the 1880s. In 1874, the prewar Patriotic Order, Sons of America, was revived. Even the newly created bodies could have ties to formations and supporters of the earlier movement. One example is the Order of the American Union in New York, which owed its existence to James W. Barker, a Know-Nothing activist. In addition, the ranks of the nativist movement were swelled by organizations that were not primarily of nativist concern, professing to "patriotic" or "ethnic" goals (e.g., the Loyal Orange Order or the Improved Order of Red Men [IORM]). In the 1880s, fired by the dispute over the question of English-language instruction in schools, the IORM turned away from its German-American members and emphasized the Anglo-American heritage.

As Dale Knobel has pointed out, the fraternities of the 1870s reshaped the meaning of "foreign" and of "native" in a distinctive way. They attached the adjective "foreign" to those phenomena of political and cultural life of immigrant origin that expressed themselves through organizations, thereby constituting a greater threat to the ideal American national character. Correspondingly, membership in an organization avowing to counteract attempts at corrupting the national character was to mark the truly "native" American. It was the promise to effectively fight the

organized "foreign" danger to the American way of life that attracted many new members.

As a movement to organize Americans, nativism of the 1870s and 1880s may be called successful, since the number of local lodges, orders, and membership rose continually. The majority of members came from a middle-class background, though a few organizations catered for potential adepts in the lower and upper classes. However, judged by the goal to counteract the alleged political and social ambitions of that phenomenon deemed nativism's most dangerous foe at the time (i.e., the concept and organizational structure of Catholicism), the accomplishments of nativist fraternities are less unequivocal. Nativist activism sensitized an expanding section of the American public to questions of national character, but it did not dominate the debate with its interpretation of Americanism to which new arrivals were expected to adapt.

Nativism from the Late 1880s to World War I

In the decades around the turn of the century, immigration to the United States soared. While nearly 3.7 million newcomers arrived in the 1890s, the climax was reached a decade later with nearly 8.8 million new arrivals. Until 1920 another 5.7 million immigrants had arrived to live and work in the United States; most of them eventually stayed.

In these years, immigration did not simply change in numbers. Statistics attested to a marked change in the country or region of origin the newcomers had left behind. Whereas fewer than 200,000 arrivals before 1880 had originated in southern or eastern Europe, more than 8.4 million immigrants arriving between 1880 and 1910 had been born in that part of Europe (i.e., in Austria-Hungary, Russia, the Baltic countries, Poland, Rumania, Italy, Spain, Portugal, Greece, or Turkey). Within a span of twenty-five years after 1882, the ratio of "old" immigration from northern and western Europe to "new" immigration from eastern, southeastern, and southern Europe was inverted: 87 percent to 13 percent in 1882, 19 percent to 81 percent in 1907.

In marked contrast to immigrants of earlier periods, the newcomers preferred the city to the country as a new home, the industrial centers, which held the promise of a job to earn one's living. Nearly 80 percent of the immigrants settled in America's industrial heartland in the Northeast—in New York, Pennsylvania, New Jersey, as well as Illinois—mainly in Chicago—and Ohio. In addition, ethnic groups tended to specialize in specific occupations and often had to accept unskilled jobs. Consequently, the proportion of foreign-born in certain occupations exceeded that of the native-born.

Attitudes

Despite the economic depression of the 1890s, the overall tendency was one of expansion. In the nation at large, the years of rapid economic, technological, and social change created or heightened anxieties and made fissures in the nation's social structure a focus of public attention. The press reported extensively about actual or supposed radical or Anarchist activities such as the Haymarket Square killings in Chicago in 1886. To some, this was proof of the absorptive powers of America being exhausted, even more so when, in 1893, Frederick Jackson Turner presented the idea of a frontier that had been closed. At the same time, interest in territories outside the American hemisphere grew and brought with it more forcefully articulated imperialist ambitions and an involvement in international conflicts.

Although the prejudice against Irish and Germans did not disappear in this period, the focus shifted to those ethnic groups that New England intellectuals in the 1890s began to describe as "new immigrants." Josiah Strong's widely read treatise "Our Country: Its Possible Future and Its Present Crisis" (1885) belonged to a series of books that rekindled fears of Catholic infiltration of (Anglo-Saxon Protestant) American institutions and values. This danger was seemingly increasing in proportion to the inflow of Catholic immigrants from southern Europe. Compared to Italian Catholics—mainly of peasant origin—the Irish immigrants of earlier decades seemed a group that could be easily assimilated. Similarly, the antiradicalism directed toward the Germans and Irish in earlier periods now became extended and sometimes transferred to the newcomers from southern and eastern Europe, intensifying the perils supposedly inherent in—by definition—foreign union activism, socialism, and anarchism.

To the categories of political and denominational foreignness was added social stigmatization, since most of the new immigrants belonged to the lower classes. Stereotypes of social inferiority blended with those of cultural inferiority. Consequently, social evils of the age, such as the problems of overcrowding, corruption, alcoholism, prostitution, and mounting crime rates, were all attributed to the changes in immigra-

tion, most emphatically to the recent immigration from southern and eastern Europe. In the working classes of earlier immigrant generations, concerns were voiced about the tide of cheap labor from abroad. In the middle and upper classes, the image of the impoverished newcomers as an addition to the native-born proletariat did its share to feed anxieties about an imminent social upheaval. Moreover, nativists considered the cultural diversity of the new immigrants a direct threat to what they described as the nation's cultural homogeneity and, in this way, to the social leadership of "true" Americans.

In turn-of-the-century America, a new thread was interwoven with the older ideological and political, social, cultural, and religious criteria to discriminate the foreign-born, thus investing nativist thought with a new intensity: a biological, pseudoscientific racism. Race theories, Social Darwinism, and fears of racial degeneration merged to exacerbate traditional prejudices on the basis of economic or cultural considerations. In line with a biological determinism, the immigrants were considered to carry the germ of vice, crime, and political chaos because of their race. The dangers to the American national character, interpreted as rooted in a specific racial makeup as well, increased accordingly. Some contemporaries contrasted immigration statistics and the fertility of foreign-born with declining birth rates in other segments of the population to underpin the idea of an imminent "race suicide" of the true Americans. Hence, racist nativism turned away from the debate on Americanization and assimilation of newcomers and instead promoted a restriction of immigration of "physical stock" incompatible with the "native American" one.

In his book *The Passing of a Great Race* (1916), anthropologist Madison Grant warned his contemporaries of an unrestricted immigration from eastern Europe. Its people, especially those of the Jewish faith, ranking lowest among human races, would eventually deprive the Anglo-Saxon race of its vitality. Though not exclusively nativist, anti-Semitic sentiment was part and parcel of nativist thinking in this period.

Paradoxically, Jewish immigrants were attacked both as dirty, vicious degenerates in a condition akin to serfdom and as pushy, greedy, and comparatively rich materialists—thus as both impoverished Anarchists or criminals and as capitalists. Nativists could adapt a general anti-Semitic sentiment existent in American society to their specific aims.

Organizations

In the late 1880s, the nativist movement was clearly on an upward turn. The number of chapters of an order rose, as did membership. Individual societies expanded; the Patriotic Order, Sons of America, for one, in 1888 claimed to have 112 chapters in Pennsylvania and another 406 in seventeen additional states, among them New York, Illinois, and Ohio. Moreover, these were important years for the movement on the national level. Issues of Protestant-Catholic rivalry entered the national political stage and provided nativist societies with an even stronger incentive to organize and act nationwide. In the mid-1880s, Henry Baldwin from New Jersey formed the National League for the Protection of American Institutions as an umbrella for nativist or "patriotic" organizations and fraternities. However, though thriving in an age of mass immigration and social unrest, only one of the new associations could boast a mass membership—the American Protective Association (APA).

The APA, the most notable nativist organization of the period and in many respects the true heir to Know-Nothingism of the 1850s, began as a small society in Clinton, Iowa, in 1887. By 1895, it had developed into an aggressive umbrella organization that ousted the National League of Henry Baldwin. Its founder was the son of a German Lutheran immigrant, Henry Bowers, a fierce opponent of "political Romanism." In other words, he held organized Catholicism responsible for educational deficiencies in his youth in Maryland. In the early 1890s, economic depression and anxiety caused by America's involvement in international disputes fed fears of mounting Catholic influence. At the time of the first national council in 1890, the APA flourished in communities from western Iowa to eastern Michigan. Laying economic and social problems at the door of Catholic immigrants who were said to take away the jobs native-born would have accepted drew more than half a million contemporaries into the APA. The years of most rapid growth were 1893 to 1895.

The mass success of the APA was the result of more than one factor. First, the association could fall back on a whole gamut of nativist organizations, making it part of a larger movement. Second, its leaders managed to use contemporary controversies to their own ends. Third, the APA was founded at a time of increased demand for fraternal organizations. Fourth and most important of all, the APA gained a skillful organizer in William Traynor. Formerly leader of the APA in Michigan, Traynor followed Henry Bowers as

president of the national organization in 1893. He directed anti-Catholic rhetoric toward immigrants of Irish, Italian, Polish, or German descent. What is more, he wanted to achieve both of two aims: to defeat Catholics and their supporters in the elections and to have nativists elected to office in their place. Whether enacted by APA members in office or by the Republican Party, the association pushed for legislation tightening the conditions of naturalization, excluding the foreign-born from the armed forces, minimizing Catholic influence, and restricting immigration of those groups deemed undesirable.

By 1896, however, the star of the APA was already falling. Traynor was driven out of his leadership in May after having assailed presidential candidate William McKinley as a pro-Catholic. The outcome of that year's presidential election was a disappointment to the ambitions of Traynor and other leaders. It ushered in the downfall of the movement, accelerated by internal dissension, the fact that members worked for their own interests instead of the movement's, and the increasing attraction of Populism. At least on paper, the APA continued to exist; it was officially dissolved eleven years after the last national meeting of 1900.

As to its impact, the APA failed to achieve its major legislative goals: immigration restriction, introduction of a literacy test—more popular only after the report of the Dillingham Commission in 1911—taxation of Catholic Church property, and refusal of diplomatic recognition to representatives of the Holy See. Nonetheless, a few of its minor goals such as the outlawing of forms of prearranged foreign labor (Foran Act of 1884) or employment preference to native-born did take shape, if only in a reduced form, as in the laws of Pennsylvania and New York in the mid-1890s that excluded foreign-born from public works jobs. The APA was a prominent form of organized activism, which boosted the nativist movement. Its downturn ended neither the movement nor the characteristic frame of mind. Yet, some of the reasons for the downfall of this particular association effected a general decline of organized nativism, a trend only to be reversed in World War I.

At the time of the APA's decline, some of the nativist societies catering for a middle-class membership began to seek allegiance with a new organization of an elitist character that promoted similar values and ideas of the national character. This organization, formed in 1894 by three Harvard graduates and presided over by John Fiske, drew its name from its major goal: Immigration Restriction League. Only the "right sort" of immigrants, an attribute based on racist discrimination of people from southern and eastern Europe, were to be allowed into the country. From 1895 onward, the league advocated a literacy test as the best means to determine "whose presence no one desires," as the principal advocate of the idea, Republican senator Henry Cabot Lodge, phrased it. For a while nativist societies supported the idea of the literacy test, but its introduction could only be effected in 1917. Similarly, legislation restricting immigration according to racist categories could only be initiated in the postwar era.

Nativism in the 1920s

The Great War shattered the optimism of the previous decade and ushered in a new phase of anxiety and social unrest, providing fertile ground for a revival of the nativists' crusades. It roused war passions even before the United States commenced to send American soldiers to fight in Europe—something believed impossible for more than a century. Although the United States had officially been at war for only twenty-one months, adjustment to peacetime conditions could not be accomplished without difficulties. Major economic problems, rising food prices, labor discontent, and radical activity of organized labor characterized the immediate postwar years. Only after 1920 did the economy enter a phase of sustained expansion, accelerating the progress of mechanization and of changes in industrial labor. On the whole, modernization allowed for a rise in real wages, almost 25 percent in the decade.

Immigration rates remained high, as another 5.7 million immigrants arrived on American shores in the war decade, and some 4.1 million more in the 1920s. The predominance of the "new immigration" and the preference of newcomers for the urban-industrial centers persisted. Alongside, immigration of African-Americans from the South into the cities of the North, begun in the Reconstruction Era, continued.

Attitudes

With the beginning of hostilities in Europe, suspicions as to the loyalty of so-called hyphenated Americans ran wild. Whoever was made out as the enemy was quickly turned into the epitome of evil. Americans of German descent became the target of campaigns drawing on the long-standing anti-German prejudice. The war had transformed their image from that of an alleged arm of the pope into a fifth column of the enemy nation in a world war. Other groups of older

immigrant generations also aroused nativist fears, most conspicuously Americans of Irish descent. This survived into the 1920s, serving as background to a new upsurge of anti-Catholicism.

As before, Catholic prejudice was linked to anti-radicalism. After the Russian Revolution, this term included anti-Bolshevism. In the early postwar era, the fear of a Bolshevik revolution, enacted by American Communists and Socialists of foreign descent, led to the Red Scare. The project of "Americanizing" the foreign-born seemed incomplete at best, so that more and more Protestant middle-class Americans of northwestern European descent began to embrace immigration restriction as the best means to preserve the American national character. This goal was ultimately achieved with the Quota Act of 1921—renewed in 1922 and 1923—and the Johnson-Reed Act of 1924, which drastically reduced the overall number of immigrants to be admitted each year as well as the quota of newcomers from southern and eastern Europe.

The increase in prosperity was not distributed evenly in the population. Resentment mounted particularly in rural areas and small towns of the Midwest, West, and South, but even in the big cities noticeable sections of the population failed to make their version of the American dream come true. These were the ranks from which the proponents of an exclusive view of Americanism could recruit their adherents. People from these ranks endorsed the notions underlying the enactment of Prohibition in 1919, both a ban on the love for intoxicating beverages identified with the immigrants and an assault on the pleasures of city life, taken as proof of a victory of rural America.

With Protestant fundamentalists, they shared antimodern, anti-urban, and anti-evolutionist concepts and the wish to impose them on the rest of society. And they were prepared to believe in anti-Semitic tirades to be read in Henry Ford's *Dearborn Independent* as well as other magazines and books. The so-called Protocols of the Elders of Zion, a forged document about a Jewish plot to take over the world, served to underpin the idea of an international Jewry conspiring against the American nation. This was added to the older anti-Jewish stereotype of the money-grubbing capitalist or member of an alien race of "strange Slavonic-Oriental admixture" (Ford) who corrupted American institutions. As with other forms of anti-alien sentiment, the anti-Semitism of the 1920s amalgamated elements of traditional anti-Jewish prejudice and fears characteristic of the modern age.

Organizations

The heated debates on issues underlying Prohibition or Protestant fundamentalism, widely publicized in the media of the mass age, fostered a revival of nativism from the mid-1910s onward. Older fraternities could expand again, new ones were formed, and some organizations from the fringe of nativist sentiment tended to adopt traditional issues of organized nativism, such as "fear of exclusion from public effectiveness, loss of participatory citizenship, powerlessness in the face of superior 'foreign' organization."

Older organizations such as the Junior Order of American Mechanics again found a growing audience, since the social and cultural leadership of "Americanism" seemed in greater danger than ever, assailed not only by alien elements from within the political machinery of city and state, but by potentially "true Americans" themselves who no longer upheld the fundamental values. Having lost 10,000 members during the early years of the century, the Junior Order could boast a membership of 224,000 by 1914. New societies were formed, and some of those that still advocated "Americanization" (e.g., the Better America Foundation, or the American Legion with nearly 1 million members after a twelve-month existence [1920]) moved toward nativism under the conditions of the postwar era.

The most prominent—though not exclusive—bearer of organized nativist activism, and at the same time its last with a mass following, was the Ku Klux Klan. After a first phase of Klan activities to restore "order" and white supremacy in the South after the end of the Civil War, the idea of a "secret" society of this kind was revived by William J. Simmons in Atlanta, Georgia, in 1915. Simmons, having failed to make his way as a Methodist preacher, turned to fraternalism instead. From the beginning, his Klan had more in common with nativist societies of the 1890s than with the post–Civil War vigilantes. It professed to fight for "Americanism," defining the backbone of the nation in terms of race, religion, and nativity. "Foreign" influences were to be effectively repressed. Klan activities could stress either the anti-Catholic, anti-immigrant, fundamentalist, anti-urban, antimodern, anti-Semitic, or antiblack sentiment, a combination of them, or all of them in one campaign, according to the specific conditions of different locales.

Ineffective in organizing a mass movement, Simmons had attracted only a few thousand followers by 1920. At that time, he contacted two skillful publicists:

Edward Young Clarke and Elizabeth Tyler. They started the Klan's transformation into a nationwide order, carried on by Hiram Wesley Evans, who took over leadership from Simmons after a long-drawn-out struggle. Evans moved the Klan even closer to traditional nativism and paved the way for a meteoric growth with millions of members by 1924—statements on membership vary from 1.5 to 6 million—with an estimate of some 1.5 million members at a given time. Yet, the attractiveness of the Klan was due to more than its nativist ideology, since it held the additional promise of community, economic advantages to part of its supporters, and fraternal support for its members. As it drew millions of Americans into a nativist organization, the Klan was a success. Nonetheless, it failed politically, since it did not achieve the political power for the moral values of "true Americanism" that it had set out to impose on the nation. With legislation limiting future immigration in 1924, nativists had lost one of the most important arguments to rally followers.

The Klan survived immigration restriction in 1924 but began to decline soon afterward owing to several factors. For one, the Klan managed to bring its candidates into office, though when in power they failed to effect the promised changes. Many of its leaders did not live up to the ideals with which the Klan attracted a mass membership. The Klan suffered from fights between individual leaders and chapters, just as other fraternities had done before. In addition, the presidential election of 1928 took the wind out of the sails of a movement that had lived on the fears of Catholics in office. This is why, in the late 1920s, with the number of new arrivals from abroad cut down to a minimum, the nativist movement found it increasingly difficult to find an audience. It declined, even though some organizations persisted, for instance, the much shrunken Junior Order of United American Mechanics, the Improved Order of Red Men, or the Ku Klux Klan, which resurfaced after World War II. Yet organized nativist activism in its traditional form, capable of mobilizing a noteworthy following, came to an end in the years of the Great Depression.

Immigrant Exclusion Movement
1870s–1920s

From the time that the Europeans first set foot on American soil and claimed it as their own, some portion of settlers has opposed continued immigration. Occasionally, immigration opponents have organized themselves into discernible, and sometimes quite powerful, social movements. Throughout American history, groups have opposed immigration to a specific region, immigration above certain numerical limits, or immigration of specific ethnic groups, political parties, or individuals. Groups have also ranged from highly organized and hierarchical to nothing more than a mob, and from those with wide popular appeal to those furthering the opinions of a tiny, but powerful, group. Often, several types of groups have coexisted. Nevertheless, several patterns characterize the politics of American immigrant exclusion and distinguish these social movements from others.

First, movements against immigration have not always focused on the same features of potential immigrants. Early on, opponents saw the main, salient threat as foreign colonial; later came religion, then race, then ideology, then economics. Second, the coalitions on either side of the debate have rarely mirrored left/right party distinctions. Generally in favor of immigration have been traditionally conservative big business interests and traditionally liberal missionary and human rights groups; against have been usually conservative racist and isolationist groups as well as traditionally liberal organized labor and African-American groups. Third, public opinion and organizations working in support of immigration have remained fairly stable and of a low level; what has changed has been the balance between those opposed to immigration and those undecided about it. Finally, social movements pressing for more or less immigration have had little effect on policy change at the federal level, which seems driven more by foreign policy concerns; instead, their effect has been on enforcement of existing federal law and on legislation at the state level.

The First Century

The colonies on North America's East Coast did not unite for over a century after they were established. Early opposition to immigrants should therefore be seen as antipathy toward incomers to (eventual) states established along different principles. Maryland was intended as a haven for Catholics, Pennsylvania as a refuge for Quakers, and the Carolinas as a mercantile zone. Each colony, and later each state, had its own policies governing residency. Some offered cash bonuses or land to tempt newcomers, while others charged fees to discourage them; some naturalized newcomers immediately, while others set onerous requirements for citizenship.

The colonies' collective interests arose from common circumstances, such as the French and Indian wars, and later the American Revolution and the fallout from the French Revolution. Colonial governments saw immigration as a way to keep the Europeans and Indians out and to keep distrusted local minorities (Africans, Catholics, Germans) outnumbered. The Declaration of Independence accused King George of "endeavor[ing] to prevent the population of these States; for that purpose obstructing the laws for naturalization of foreigners, refusing to pass others to encourage their migration hither, and the conditions for new appropriation of lands." Yet new governments worried about importing people dissimilar from those they already harbored. Benjamin Franklin, who saw Pennsylvania as a democratic experiment, contended that "those who come hither are generally the most stupid of their own nation. . . . Not being used to liberty, they know not how to make a modest use of it . . . even our government will become precarious." Since the colonies largely defined their enterprises in religious and moral terms, these were the

terms in which desirability was gauged. Public opinion and local government concurred that morality had to be watched. Pauperhood, degeneracy, and Catholicism had no place in any of the colonies; nor did settlements of those with different customs and language, who threatened a colony's integrity.

Independence created a new national category, "Americans," loyal to no foreign power, but the Constitution did not mention how one became an American. The Alien and Sedition Acts of 1798 reacted against the French Revolution by banning both monarchists and antiroyalist revolutionaries. But after these acts lapsed, the federal government was silent. For the first century of America's independence, there was no central, federal, immigration control. Instead, the various states each allowed or disallowed whom they pleased. This created a dilemma at the national level because an incomer granted citizenship by an easy state continued to be an American citizen in "hard" states. The United States did not define citizenship until 1868, with the Fourteenth Amendment, nor did it establish a uniform rule of naturalization until 1876. Yet this period saw one of the most sustained and consequential movements against American immigration.

During the early nineteenth century, Europe went through one cataclysm after another, each resulting in emigration, which then shaped the nativist backlash. The Napoleonic wars, industrialization, famine, and revolutions kept Europe mobile for the first half of the century. Depression, war, and political unifications kept people moving through the second half. Breakthroughs in transportation and communication meant that many more of the uprooted could try for America. Social movements in the United States in the nineteenth century did not target immigrants per se but instead focused on categories of people who were "different," many of which overlapped greatly with immigrants.

Most conspicuous to Americans was the rise of the Catholic Church, associated popularly since colonial times with an antidemocratic authoritarianism that would erode American institutions and practices. In addition, state party officials would naturalize immigrants—many coming from Catholic countries—at election time, in exchange for votes. This led to a widespread perception that immigrants were corrupt and corrupting of political institutions. Moreover, immigrants settled in, and were counted in, the North, leading to dismay among Southern representatives. Such sentiments became widespread through the 1840s, leading to the establishment in 1854 of the Know-Nothing Party, which sought to allow immigration, but to separate it from naturalization (i.e., the granting of full political citizenship). Citizenship and voting rights would only be given to those in residence for at least twenty years.

The Civil War and the slavery question overwhelmed this party, as they did so much else. Regional loyalties overcame policy disputes and gave immigrants a chance to demonstrate a positive commitment to the government, usually the Union. Mobilization mixed ethnic groups to an unprecedented extent, while war suspended further immigration, leading to a great mixing of the newly arrived with the long established. Yet the Civil War highlighted the division between European immigrants, who were after all white and eligible for citizenship, and descendants of Africans. African Americans gained citizenship in 1868, following passage of the Fourteenth Amendment.

Racial Competition

After the Civil War, sentiments toward immigration were shaped by three significant ideas: scarcity, the survival of the fittest, and empire. American settlers occupied the continent all the way to the Pacific. Widespread unemployment led to the idea that immigrants could only make matters worse for Americans. In addition, eugenics, the "improvement" of offspring through selective breeding, and Social Darwinism were in vogue. Immigration, many feared, could affect the prospects of the white race. Finally, the Spanish-American War resulted in American possession not only of colonies, whose citizens were by definition second-class, but of colonies of "brown" and "yellow" people. Each phenomenon posed the question: to best survive, should America accept immigrants at all? And if so, of what sort?

As Americans debated immigration policy, attention was also paid to the welfare of the newcomers. Immigrant aid societies were established in the larger cities. Many of them were organized to take care of conationals, as, for example, the Hebrew Sheltering and Immigrant Aid Society with Jewish immigrants. Some were run as charities by churches or by social reformers, who saw in the immigrants potentially healthy, literate, and productive citizens neglected by society at large but redeemable with effort. Churches sponsored families and volunteers tutored newcomers in English and American culture.

California was a different story. After the gold rush, white miners began to enter the land and labor markets, and were met by competition from Chinese

and Japanese immigrants who had earlier been shunted into agriculture and into ghettoized work camps. Prominent newspapermen editorialized against foreign ownership of American land and the corruption of American men, who took advantage of the gambling and prostitution set up in the legally mandated ghettoes. Asian laborers were lynched on the West Coast; California asked Congress to ban Asian immigration. In 1882, Congress passed the Chinese Exclusion Act, which prevented most Chinese immigrants from coming to the United States for ten years. It was the first national law ever passed banning a group of people based on race or nationality. It was reenacted in 1892 and again in 1902, and was made permanent in 1904. At the State Department's request, from 1908 onward, the Japanese were allowed to restrict emigration themselves, so that the embarrassment of their exclusion could be avoided. "Hindoos" were excluded as "likely to become a public change" until 1923, when the U.S. Supreme Court ruled them nonwhite, hence ineligible for naturalization along with the Chinese and Japanese. Protesting Asian exclusion was left to a handful of missionaries, who knew the people firsthand. Most Californians saw these acts as solving the problem of scarcity by eliminating a triple threat: a competitor for jobs, people they considered racially inferior, and an emissary of a competing empire.

Opposition to racial exclusion took several forms. The legally minded sued, contending that immigrants' rights had been violated. In *Nishimura Ekiu v. United States* (1891), however, the U.S. Supreme Court ruled that immigrants—noncitizens—have no rights to violate. Upholding the exclusion of a twenty-five-year-old Japanese woman married to a U.S. citizen, the justices invoked "sovereignty," the broadest possible principle: "It is an accepted maxim of International Law, that every sovereign nation has the power as inherent in sovereignty, and essential to self-preservation, to forbid the entrance of foreigners within its dominions, or to admit them only in such cases and upon such conditions as it may see fit to prescribe." The government's authority was absolute and political; the executive and legislature, not the judiciary, controlled admission. Nothing Congress did in this area of law could be unconstitutional. Only the executive branch worried about the message this sent to foreign governments.

Such was the tone at the turn of the twentieth century, when the U.S. Congress established an Immigration Commission to survey law and to recommend change. It described recent immigrants as illiterate, superstitious, and racially distinct. It suggested a literacy test as a way to select the "best" among the applicants, and it delineated geographic zones, covering most of Asia, from which nonwhite immigration was barred. Most attention to issues of immigration came from the upper classes, which were divided on the question of race. Internationalists included diplomats, missionaries, and foreign businessmen who had lived abroad. Restrictionists included university presidents and professors, and the established elite, among whom ideas of eugenics had gained great popularity. William McKinley's assassination by an east European Anarchist immigrant appeared to justify their worries.

Jane Addams and other social reformers testified against restriction. "At this time when we are hoping that the United States may take a leading part in a new internationalism which will mean such a world reorganization as will guarantee respect for the rights of different nationalities, the passage of this law would be peculiarly unfortunate. How can we urge Russia, Austria, and Germany to recognize the claims of people against whom we are, at the same time, discriminating?" George Kennan, diplomat and theorist of foreign policy, concurred that immigration restrictions would aid the new Soviet regime; Louis Marshall argued that a literacy test was "absolutely arbitrary." Organizations arrayed in opposition included the Federal Council of Churches of Christ in America, the Methodist Church, the Presbyterian Board of Missions, the National Lutheran Council, the Young Men's Christian Association, the National Council of the Protestant Episcopal Church, and the American Jewish Conference. Heads of prominent American universities—indeed, the biology departments of Harvard and the Massachusetts Institute of Technology—argued against them on eugenic grounds.

Isolation

World War I proved a significant turning point for immigration. The prevailing image of the international environment as one of violent competition crystallized during the war. Representative John Calvin Box (D-TX) said that "Nations and races have struggled for a place in which to exist and enlarge since before the years covered by human history. We are trying to maintain a place here for us and our children to which the crowded-out, hungry, unhappy millions of the Old World are struggling to come." War imagery dominated the immigration debate. Lillian Russell Moore, an actress asked by President Warren Harding to report on immigration, claimed that "the

higher civilizations of past ages, history teaches us, succumbed to such foreign invasions as now threaten us." Race displaced (rather than fronted for) economic arguments. Ellison Smith, of South Carolina, said, "I would rather see American citizenship refined to the last degree in all that makes America what we hope it will be than to develop the resources of America at the expenses of the citizenship of our country." The country shunned alliances, rejected the League of Nations, restricted immigration, and imposed tariff walls. "America must be kept American," said President Calvin Coolidge in a message to Congress.

Nativist activism arose mainly from veterans' groups and labor unions, which saw foreigners as economic competition, and the Boston elite, who believed newcomers to be undermining the Anglo legacy their ancestors had left. Henry Cabot Lodge, for example, said that "the additions to this country until the present time have been from kindred people or from those with whom we have long been allied and who speak the same language." Californians continued to press their racial objections. V.S. McClatchy, publisher of several San Francisco–area newspapers, testified that "the Japanese do not create. They imitate, improve, appropriate." Opposition was joined by the Delegation of Patriotic Societies, the National Civic Federation, the American Legion, the Daughters of the American Revolution, and the New York Chamber of Commerce.

The National Origins Quotas, enacted from 1921 to 1924, reduced to 150,000 the number of annual immigrants who would be accepted and allocated sections of this number to various countries according to the country's weight in supplying the American population. This cut back substantially on immigration from southern Europe. The act also retained the provision that no one ineligible to naturalize would be admitted; this linked immigration policy to a separate naturalization statute that banned virtually all those of Asian ancestry from naturalizing. Migration from the Western Hemisphere was left numerically unlimited. The Great Depression saw no legislation opposed to immigrants, nor agitation against them. Immigration itself had naturally slowed greatly during this time; indeed, emigration exceeded it for most of the period.

War and Ideology

Immigration became politically salient again in the middle of World War II, when those who had all along opposed the exclusion of Asians noted that the list of friends and enemies set out in the immigration act did not match the allies and enemies in war. India and Burma (Myanmar) fought for the Allies; China had been invaded by Japan; the Germans who had been moderately favored on historical and racial grounds were proving to be the bitterest enemy. In an October 11, 1943, message to Congress, President Franklin D. Roosevelt argued for repeal of the Asian exclusions: "We owe it to the Chinese . . . to wipe from the statute books those anachronisms in our law which forbid the immigration of Chinese people into this country"; the United States could also "correct a historic mistake and silence the distorted Japanese propaganda." Hearings held during the war aired the idea that the Allies' morale could only be low if they fought knowing that the United States maintained an insulting view of their genetic worthiness. Author Pearl Buck argued in 1943 that Japanese exclusion had been 'the death blow of liberalism . . . the single thing that has made Japan regard us as an enemy." Buck and other prominent public intellectuals with ties to Asia successfully helped to overturn the racial element of the bar, though not to raise the number allowed in.

Following the war, three developments challenged, and eventually undermined, American immigration policy. First, just as had World War II, the Cold War revealed a substantially different pattern of allies and enemies than that envisioned in immigration law. The Truman administration wanted to accept refugees from communism but could not because many of them were from eastern and southern Europe, regions legally considered to be racially undesirable. In an October 17, 1952, speech, President Dwight Eisenhower bemoaned the continuation of restrictions: "A contest for world leadership—in fact, for survival—exists between the communist idea and the American ideal. That contest is being waged in the minds and hearts of human beings. We say—and we sincerely believe—that we are on the side of freedom. . . . Yet to the Czech, the Pole, the Hungarian who takes his life in his hands and crosses the frontier tonight . . . this ideal that beckoned him can be a mirage."

Second, the civil rights movement had politicized racial restriction at the federal level, making it difficult for legislators to continue language of racial inferiority in the immigration statutes. Third, decolonization provided the United States and the Soviet Union the opportunity to compete for allies; the Soviet Union promptly drew attention to the racial provisions of American immigration law to demonstrate the thin American commitment to justice. In all of these cases,

American immigration policy undermined larger policy goals. Congress and the executive branch struggled from 1952, when national origins quotas were reaffirmed, until 1965, when they were finally discarded, over race in immigration. Working to keep the restrictions were mainly veterans groups, specifically the Veterans of Foreign Wars and Regular Veterans' Association. Working with the executive branch against them were religious groups such as the Quakers, ethnic groups such as the Polish-American Congress, patriotic organizations such as the Order of the Sons of Liberty, and even the major trade unions, such as the National Women's Trade Union League, the Congress of Industrial Organizations, and the American Federation of Labor.

Family

As a consequence of this agitation on behalf of an internationalist outlook, in 1965 the U.S. Congress passed, and President Lyndon Johnson signed, a new comprehensive immigration act. It had four unprecedented features. First, it eliminated racial considerations from American immigration and naturalization policy. From 1965 on, "nationality" referred to place of birth rather than ascriptive ethnicity. Second, it equalized the numerical limits for countries, giving an overall cap of 270,000 and a country limit of 20,000; supposed contribution to historical American immigration was abandoned as a guideline. Third, it included Western Hemisphere countries for the first time. Previously not limited numerically, countries from the Americas were now included in the general scheme. Finally, preference rankings, which indicated how to choose among applicants from the same country, were rewritten so that second- and third-degree family members could expect acceptance at twice the rate of economic immigrants or refugees. This had the effect of maintaining the racial distribution while eliminating race as a criterion.

At this time, population politics had become a burning issue. World population appeared to many to be growing at too high a rate; contraceptive breakthroughs and the legalization of abortion gave momentum to groups advocating "zero population growth." These groups opposed immigration on two separate grounds: that immigrants were just as bad as births in adding to the population, and that immigrants tended to have children at greater rates than native-born Americans. Once again, the idea of a limited frontier motivated efforts at restriction.

Coinciding with this change in U.S. immigration policy were two events whose outcome was to radically alter the types of immigrants Americans accepted. In both Cuba and Vietnam, the United States struggled within a nationalist-Communist civil war, developed ties to one side, and withdrew without a victory. In both cases, those whom America supported would have been abandoned to confinement at best and retaliation at worst; in both cases, the United States government enacted special exceptions to the numerical limits to accept and resettle emigrés. Tens of thousands of Cubans and nearly 1 million Indochinese resettled in the United States during the 1960s and 1970s. As permanent American residents and citizens, these newcomers were eligible under the 1965 law to sponsor family members. As a result, the United States for the first time became a true, legal home to Asians and reaffirmed its commitment to its Hispanic neighbors.

Economics

American immigration policy always contained provisions relating to immigrants' potential economic impact on citizens. At all times, those "likely to become a public charge" were barred from entry; at various times, contract laborers and those bringing in skills Americans already had were also barred. Not until the 1980s did economic considerations take center stage.

American labor unions had weakened by the 1980s, when job competition with Europe and Japan became a central worry. States worried about how to pay for services for the immigrants who were already there. Texas tried to deny education to illegal immigrants; this was overturned on the grounds that the statutes establishing public education did not make that distinction. California saw the rise of literacy movements, specifically those opposing bilingual education, and petitions to deny public services to illegal, and even some legal, immigrants. Public opinion began to coalesce around the idea that preferring relatives was fine, but unless the aunts and uncles could do something useful, it was a preference that the country could not afford.

Economic arguments were also used against immigrants claiming refugee status. Prominent organizations like the Federation for American Immigration Reform lobbied against relaxation of immigration barriers. Hondurans, Nicaraguans, and Salvadorans left the wars in Central America for the United States, to be denied admission as refugees on the grounds that they were not politically oppressed but sought economic betterment. In response, churches and left-wing activists in the United States, such as those in the Committee in Solidarity with the People of El Salva-

dor, aided those who had entered illegally, giving church sanctuary through civil disobedience. The numbers remained small.

Federal policy toward immigrants changed in a two-step process in 1986 and 1990. The first efforts aimed to clarify the status of the 3 to 5 million illegal immigrants living in the country. Each was to be legalized through an amnesty program, or to be deported: in or out, not in between. Once this had been accomplished, immigration laws could truly separate citizens from noncitizens. The 1990 reforms added relatives and refugees to the groups facing numerical limits, leading to a 480,000 annual growth in migration. Now every type of applicant was covered by the same law. The reforms also streamlined the list of preferences and exclusions, eliminating categories like "feebleminded" and "deviant" in favor of broad concerns about security, health, and crime.

Environmental groups in the western United States also came out for the first time in opposition to immigration. The Sierra Club in particular caused a stir when it editorialized against immigration on environmental grounds. These groups had no effect on federal policy but did succeed in adding ecological effects to the inventory of concerns that Americans connected to immigration policy.

Way of Life

Each of the social movements, state laws, and federal laws has posited an American way of life, which immigration—or methods of immigration restriction—threaten. Early in American history, immigrants were wanted to populate the continent against the Europeans and Indians, who threatened the American way of life. Over time, the "way of life" has emphasized a Protestant heritage, a white outpost, a democratic bastion beset by monarchists, anarchists, and despots, a pillar of freedom, and a zone of economic opportunity. Each change in federal law responded to a perceived external threat. Social movements in favor of immigrants have always included ethnic aid societies, legal societies, and religious organizations; opposition has always included state welfare bureaus and veterans' societies. Labor unions and businesses have seesawed, as have literacy organizations and environmentalists. Immigrants' potential to change themselves and their host communities has always been great, so immigration can be expected to attract political attention forever.

Anti-Catholicism Activism

On a literal level, anti-Catholicism is most simply defined as resistance to the Roman Catholic Church, its doctrines, its leaders, and/or its laity. But in addressing anti-Catholicism's formative role in American social history, it might best be understood as the belief that Catholic attitudes or individuals were incompatible with American values and, by extension, that Catholicism was fundamentally foreign and hostile to America itself. Anti-Catholic attitudes have sparked a vigorous series of battles—in the political arena, in literature and newspapers, even in riots and vigilante violence. At the root of these conflicts is the assertion that Catholics were foreign and dangerous to American institutions and values and therefore needed to be kept in check by native-born Protestants. The perceived superiority of native-born guardians of American virtue (which historians term *nativism*) over their Catholic opponents, which personified un-American and foreign influences, became the foundation on which anti-Catholic agitation was built from the colonial era through the twentieth century.

Resentment and hostility toward Roman Catholicism certainly predated the establishment of American colonies. Following the Protestant Reformation, European nations frequently waged bitter warfare, pitting Catholics against Protestants for political, economic, and ecclesiastical legitimacy and control. European settlers transplanted these conflicts to American shores. This was particularly apparent in the celebration of the European holiday Guy Fawkes Day—dedicated to the memory of the infamous arsonist Guy Fawkes's foiled "Gunpowder Plot," which attempted to blow up the British Houses of Parliament to protest the poor treatment of British Catholics in 1605. Renamed "Pope Day" and observed annually on November 5 in several colonial cities (particularly Boston), the celebration thoroughly mocked Catholics by parading burning effigies of the Pope through the streets. Even more significant, however, was colonial opposition to the passage of the Quebec Act in 1774, which permitted the practice of Catholicism in eastern Canada, which had come under British control. This proved an additional source of animosity for American revolutionaries who saw the preservation of French law, language, and, most important, French Catholicism, as unacceptable and threatening to life in the British colonies. Moreover, by extending the boundaries of Catholic Quebec into the Ohio Valley, American colonists feared the extension of foreign influences and saw the Quebec Act as one of several errors of parliamentary law.

Anti-Catholicism in Nineteenth-Century America

Although Catholics had remained demographically insignificant in most areas of the British colonies, the arrival of European immigrants, initially from Ireland and Germany and later from southern and eastern Europe, sparked conflict between "native-born" Protestants and their allegedly alien Catholic neighbors. Thus, the early nineteenth century witnessed more overt expressions of American anti-Catholicism in American cities. In 1834, a mob formed outside the Ursuline convent in Charlestown, Massachusetts, when scandalous newspaper articles and pamphlets purported that a young girl, Rebecca Reed, was held there against her will. Even more stunning, reporters accused Catholic nuns of trapping naive Protestant girls in secret convents and stealing them away from their families. Incited by these stories and reports of Catholic sexual depravity (which concluded that nuns served as prisoners, slaves, or prostitutes for depraved priests), Protestant rioters stormed the convent and later burned it to the ground. The following year, rather than condemn their actions, local jurors praised their valiant defense of Protestant women and fully acquitted them.

An even more extreme form of vigilante anti-

Catholicism occurred in 1844, when Philadelphia Catholics asked local school board officials to permit Catholic students to read from Catholic translations of the Bible rather than the Protestant King James version, which was the school's standard text. Furious that Catholics would attempt to challenge local government and anxious to preserve public schools from perceived encroachment, nativists flew into a rage. Waves of riots swept the city for several months, resulting in twenty deaths and the destruction of Catholic schools, churches, and over 100 homes. Similar riots occurred throughout the nineteenth century in East Coast cities, including Boston, Newark, and New York. In one particularly bloody riot in New York City in 1871, Protestant and Catholics clashed over a parade by the Orange Order—a Protestant group that combined anti-Catholic and anti-Irish rhetoric in its pageantry. A single day of rioting left 62 people dead and over 100 injured.

As the 1834 Charlestown riot illustrated, the promulgation of anti-Catholic literature was enormously important in shaping and stimulating anti-Catholic sentiment in the nineteenth century. Rebecca Reed's heartbreaking story *Six Months in a Convent* (1835), which reported the alleged violence and imprisonment in the Charlestown convent, and led directly to the acquittal of the arsonists, proved enormously popular. But in 1836, an even more scandalous and sensational book appeared that galvanized nativist attention against Catholic foes—*The Awful Disclosures of Maria Monk*. The story claimed to be an autobiography of a French Canadian novice in the Hotel Dieu convent of Montreal. After initiation, Maria Monk slowly learned increasingly shocking and sinister details of Catholic life within convent walls. She gave graphic details of orgiastic trysts between priests and nuns, who were forced to serve as prostitutes after final initiation into the order. Monk claimed that nuns gave birth to illegitimate children, which they promptly strangled to death, and that they buried their bodies so that Canadian officials would never learn the truth about convent life. Convents themselves, Monk concluded, were no more than prisons in which women worked as slaves and priests satisfied their illicit sexual urges.

Monk's book proved to be an immediate best seller—publishers produced several editions, and sales topped 300,000 by 1860. *The Awful Disclosures* remained in print well into the twentieth century and influenced later generations of anti-Catholic writers and editors. Scholars have speculated that the book's pseudopornographic descriptions and titillating glimpses at illicit sex generated much of its publicity. By posing as a warning against Catholic enemies, *The Awful Disclosures* provided a respectable way of reading shocking and scandalous descriptions for Protestant readers. Ultimately, however, Monk's account proved to be contrived. As Catholics themselves attempted to argue for decades, Monk was never a nun in the Hotel Dieu convent—she was actually a Montreal prostitute who, with the help of editors, collaborators, and ghost writers, fabricated most of the details she reported.

The Know-Nothings

Partly as a result of the literary and cultural credence given to anti-Catholicism in the mid-nineteenth century, nativists developed resentment toward "Romanism" and to Catholics within their midst into a political issue as well. In 1849, nativists in New York City organized a secretive meeting of a group they called "The Order of the Star Spangled Banner." Members of the clandestine order had to prove that they were born in the United States and pledged to oppose Catholics, removing them from public office and school boards whenever possible. By the 1850s, the order had grown in popularity, and its members organized into a substantial political presence. Officially called the American Party, the group was more commonly termed the "Know-Nothings," since they were instructed not to reveal the secretive workings or membership of their organization. Know-Nothing candidates proposed long waiting periods before immigrants could receive American citizenship, restricting officeholding and voting rights to the native-born, and strict limitations on immigration (an idea that would come to fruition several decades later in the immigration legislation of the 1920s). These initiatives, combined with a neutral stance that neither supported nor denounced slavery, won the American Party wide support in the 1850s. By the middle of the decade, Know-Nothings held several seats in the U.S. Congress as well as substantial support in state and local governments.

Ultimately, however, the American Party disintegrated over the slavery issue, and the movement lost ground to Democratic and Republican parties. The Civil War itself provided a brief hiatus from American anti-Catholicism, and many Catholics hoped that their wartime service would illustrate their American loyalty and patriotism. Yet, shortly after Reconstruction, America's anti-Catholic sentiment rebounded, notably with the birth of another anti-Catholic political movement, the American Protective Association (APA),

An indication of the popularity of the nativist movement of the 1850s, a Boston manufacturer used an American flag with the words "Know Nothing Soap" emblazoned upon it. *(Library of Congress)*

which followed much of the same rhetoric and tone of its Know-Nothing forerunners. The APA began in 1887 during a disputed mayoral election in the small town of Clinton, Iowa. Its founder, Henry Bowers, believed that Catholic propaganda had cost him the position of mayor, and he then began a campaign to eradicate Catholic influences from politics. His movement, like earlier instances of anti-Catholicism, proved phenomenally successful but extremely short-lived. By 1890, the APA had grown from a small group in a single town to a national movement with over 2 million members. The movement also sponsored a series of newspapers, a political platform that sponsored congressional campaigns, and an infrastructure that influenced state and local politics. Although the APA grew quickly, its decline was faster still—by 1896, the APA had lost a great deal of its membership and support, and by 1900 the group had thoroughly disintegrated.

The decline in America's anti-Catholic interest did not last long. Within a decade of the APA's collapse, another anti-Catholic episode occurred—the dramatic proliferation of anti-Catholic periodicals in the 1910s. Nearly two dozen fervently anti-Catholic periodicals circulated in the 1910s, each of which argued that Catholic residents could not be spiritually committed to the Pope and remain politically loyal to the American government. One of the most outspoken proponents of this nativist rhetoric was the early twentieth-century writer and agrarian Populist Tom Watson. Watson insisted that several Catholic groups—parish priests, the Knights of Columbus, and religious orders, particularly the Jesuits—were actually the Pope's secret warriors in America. Their goal, Watson claimed, was to wage a secret war in America, undermining political institutions to place a papal puppet in control of American society. The same themes were articulated by the incredibly successful anti-Catholic newspaper *The Menace*, which both warned of a papal coup and blamed Catholic corruption for the failure of progressive political reforms. *The Menace* was founded in 1911, and, within four years, it boasted a circulation in excess of 1.5 million weekly readers, spawning a host of imitators in rural towns throughout the next decade.

Restating the horrors of convent seduction and orgies made famous by Maria Monk, and infusing its pages with patriotic symbolism characteristic of "The Order of the Star Spangled Banner," *The Menace* and similar periodicals evoked the rhetoric of prior anti-Catholic movements. But they also adopted the prevailing journalistic tone of muckraking, pointing out societal problems with a shrill, even alarmist, tone. Capitalizing on new journalistic conventions, such as new mailing rates, new printing technology, innovative marketing and publicity schemes, and America's long-standing nativist traditions, anti-Catholic periodicals achieved tremendous, though temporary, support. Readership quickly declined in the late 1910s as the beginning of World War I brought a halt to most anti-Catholic publishing and resentment toward the Pope was shifted toward the Kaiser. However, during the 1920s, and for the next several decades, Catholics were exposed to renewed attacks, largely from the second Ku Klux Klan. Catholics were one of many groups singled out as disloyal and potentially "un-American" by the second Klan, which became an increasingly powerful political organization.

Catholics in Twentieth-Century Politics

America's uneasiness toward Catholicism sparked legislative and governmental intervention as the 1920s

wore on. By this time, "No Popery" and "Immigrants Out" had become synonymous slogans in the ongoing political battle for immigration restriction. In fact, the immigration quotas adopted in 1924 were designed explicitly to exclude large numbers of immigrants from southern and eastern Europe whose religious beliefs and ethnic stock were deemed inferior to those of Protestant Americans. In 1928, Al Smith, the Catholic governor of New York, encountered similar resentment when he ran a campaign for president. Although Smith won the Democratic nomination, he was denounced and defeated largely over assumptions that he would bring "Popery" into public schools and undermine the Protestant character of the nation. Although Smith's criticisms of prohibition and his Democratic connections also hurt his campaign, his attachment to "foreign" Catholicism contributed to his loss to Republican candidate Herbert Hoover.

In 1960, John F. Kennedy faced similar opposition in his presidential campaign against Richard Nixon. Kennedy, a Catholic senator and Democrat from Massachusetts, was greatly influenced by the anti-Catholic propaganda surrounding his candidacy. Kennedy often downplayed his connections to Rome, insisting that the U.S. Constitution, not papal dogma, would dictate his political decisions. In the Senate, Kennedy voted against using federal funds to subsidize parochial schools and opposed the appointment of an American ambassador to the Vatican. Although both moves earned him sharp reprisal in the Catholic press, Kennedy's political record also demonstrated to many Protestant voters that Catholicism was not enough to disqualify a candidate from office. Some conservative critics still felt that Kennedy's election was part of a papal plot aimed at subjecting Americans to Roman rule. But Catholics cheered Kennedy's election not simply as a political victory but as a symbol of Catholics' prosperity and success in spite of adversity and bigotry.

Kennedy's victory, however, did not signal the complete departure of anti-Catholicism from American culture. In fact, the mid-twentieth century provided fertile soil for a reemergence of anti-Catholic literature, albeit with a different emphasis than its previous counterparts. In 1949, Paul Blanshard, a noted intellectual, lawyer, and scholar whose previous publications appeared in public intellectual journals such as *The Nation*, published his classic text *American Freedom and Catholic Power*, vigorously opposing the influence of Catholicism in American politics. Throughout the twentieth century, intellectuals continued to worry about Catholicism's influence on America's culture and electorate. John Dewey, for instance, expressed similar sentiments as Blanshard, openly questioning whether Catholics of eastern European descent possessed the individualism and intellect to participate in American democracy. Publishing a series of books denouncing Catholicism throughout the Cold War, Blanshard and others signaled a new, more intellectualized approach to American anti-Catholicism—one based on social critique by scholars rather than the riots and soft-core pornography that had characterized previous episodes of anti-Catholic aggression. Blanshard's work proved immensely popular—*American Freedom and Catholic Power* sold over a quarter of a million copies and appeared on several best seller lists. His subsequent works likewise highlighted anti-Catholic themes in the United States and abroad.

Vestiges of Anti-Catholicism

Ironically, Blanshard's books appeared at a time when American Catholics were enjoying unprecedented equity with their Protestant peers. In 1955, sociologist Will Herberg published his landmark study *Protestant, Catholic, Jew: An Essay in American Religious Sociology*, which argued that Catholicism was one of the three foundational religions within American society. Scholars have continually debated the precise time that American Catholics integrated themselves into the nation's "mainstream," if, indeed, this has ever occurred. Although American society had moved away from the vigilantism that characterized the most blatant forms of anti-Catholicism in the nineteenth century, Blanshard's words are nevertheless informative because they illustrate both the prevalence and durability of America's anti-Catholic attitudes. Although Catholics gradually (albeit inconsistently and with a measure of trepidation) moved into the realm of middle-class and mainstream respectability, Blanshard's remarks illustrate that nativistic thinking and anti-Catholic sentiments proved remarkably long-lasting.

In May of 2002, amid the controversy over sexual misconduct and priestly coverup, Fordham University sponsored a conference on American anti-Catholicism, calling it "The Last Acceptable Prejudice" in America. The keynote speaker, renowned sociologist of American Catholicism Andrew Greeley, began his address by suggesting that anti-Catholicism is fundamentally American, and reiterating a point he first made in his 1977 study of the topic, Greeley termed anti-Catholicism America's "Ugly Little Secret." This powerful and enduring mode of American

culture continues to this day, albeit in a muted, implicit form, particularly, Greeley asserted, in academic, literary, and intellectual circles. The longevity of anti-Catholic thought is matched only by the breadth of its influence—few other cultural forces have shaped the political, literary, and intellectual contours of American development over the course of three centuries.

Ku Klux Klan

Ever since its founding immediately following the Civil War, the Ku Klux Klan has been a tool for certain segments of white American society to use to resist the forces of social change. The Klan was a reactionary movement, attempting to return U.S. society to an era when white, Protestant males held power over people of other races, members of other religions, and women. During Reconstruction, the Klan acted essentially as the militant wing of the Democratic Party in the Southern United States. Using intimidation and violence, the Klan sought to stifle most of the freedoms held by freed slaves after the Civil War. The Klan helped overturn radical Republican rule and end Reconstruction. After largely dying out in the 1870s, the Klan reemerged a half-century later, amidst the dramatic social and cultural changes wrought by World War I. Embracing small-town, Protestant values as well as white supremacy, the second Klan acted forcefully and often violently against ascending minority groups of the 1920s—Jews, women, immigrants, and African Americans among them. The Klan rose for a third time—visibly but less effectively—during the civil rights era of the 1950s and 1960s. Like the Reconstruction Klan, the third Klan used violence in an attempt to halt the political, social, and economic progress of African Americans. Although the white hoods and burning crosses of the Klan remain virulent, potent images, the Klan today has few members and little influence.

The Klan and the Reconstruction Revolution

In June 1866, half a dozen young Confederate military veterans formed the Ku Klux Klan in Pulaski, Tennessee, merely to "have fun, make mischief, and play pranks on the public," in the words of their manual. Their main activities consisted of dressing like ghosts and making appearances at barbecues, dances, and other social gatherings. To enhance their ghostly appearance, white hoods with eye holes became standard. Shrouding their club and initiations in secret ritual, the Ku Klux Klan—derived from the Greek word *kuklos*, meaning "circle"—resembled many fraternal organizations in the United States during the late nineteenth century. The appearances and practical jokes of the Klan enlivened the sleepy town of Pulaski, and local townspeople generally enjoyed their antics.

Young men in various Tennessee counties quickly formed their own chapters, adopting Klan rituals and practices. As Klan membership grew, the activities of its members became more disruptive. Klan activity began to focus in particular on the former slaves in the area, and many whites imagined that the Klan easily intimidated these African Americans. At the same time, the Republican government of Tennessee prepared for a confrontation with the Tennessee Conservative Party, a coalition of Whigs and ex-Confederate Democrats. Angered by the implementation of black suffrage, Conservatives decided to enlist the help of the Ku Klux Klan to serve the purposes of the Conservative Party and to counter the militia formed by Tennessee's Republican governor, William G. Brownlow.

In early 1867, the Klan was reorganized into a statewide political organization. Gathering in Nashville, Tennessee, Conservative Party members swore allegiance to the Klan. The organization now had a formal hierarchy, rules governing the operation of local dens, and secret codes with which to communicate information to other members. They soon had a supreme leader as well: Grand Wizard Nathan Bedford Forrest, a popular Confederate general and former slaveholder. Pledging themselves to secrecy, Klan members returned to their home counties and embarked on a publicity campaign. This campaign helped to bring recruits to the organization, as well as

to prepare the Klan for the coming electoral battle between Conservatives and Republicans.

In August 1867, still extant only in Tennessee and perhaps northern Alabama, the Klan embarked on a campaign of parades and demonstrations on behalf of Conservative political candidates. This activity had little effect on the elections: the Republicans were easily swept into office. Instead of ceasing after the elections, however, Klan activity became more violent. The months of late 1867 and early 1868 saw Tennessee Klansmen begin their terror campaigns of night riding. Groups of anywhere between a handful and 100 Klansmen would visit their victims late at night, on the pretense of a suspected crime. Their chosen victims were almost invariably black men, who would be whipped, stabbed, beaten, shot, or sometimes hanged. The Klansmen often accused and convicted their victims of a "crime" before they administered their "punishment." Sometimes the victims were accused of theft or arson, while others were whipped and even hanged because they voted for Republican political candidates. Klan terrorism occurred most frequently and with its greatest success in areas where political and racial representation were nearly equal.

This vigilante justice built on a tradition of white violence against and fear of a black revolt that dated back to the early days of the slave system. White slaveholders had been able to discipline their slaves as they pleased; whippings were common. At the same time, the slave's existence as property prevented many slaveholders from actually killing their slaves. After emancipation, former slaveholders retained their notions of white supremacy and violence but were freed from the previous financial disincentive to cripple, maim, or kill blacks.

In the antebellum era, slaveholders lived in constant fear of a slave revolt. The legacies of Saint Domingue, Toussaint L'Ouverture, Nat Turner, and John Brown all kept slaveholders in constant fear of a looming slave revolt. While this threat was mostly an imagined one, the idea remained after emancipation. Southern whites feared that once given equal rights, blacks would undoubtedly integrate and uproot white dominance of the social order and perhaps unleash a bloody race war. Only intimidation could prevent such an upheaval. Informed and inspired by these traditions and fears, the Ku Klux Klan became a powerful force wrought by Southern white men against the revolutionary impulses of Radical Reconstruction.

The Klan expanded at a blistering pace throughout the South beginning in the spring of 1868. As the Congressional Reconstruction Acts of 1867 brought Republicans to power throughout the states of the former Confederacy, Klansmen launched countless campaigns of brutal terror across the South. Many dens emerged through the efforts of Nathan Bedford Forrest; many others grew simply through word of mouth or favorable press coverage. Klan attacks were most often aimed at the sources of black and Republican strength. Teachers of black students, known or suspected Unionists, and the notorious carpetbaggers and scalawags suffered the Klan's violence. The Klan exerted considerable violence on members of the Union League, a Republican political organization whose secretive nature only further angered and alarmed Southern whites.

Klan violence was consistent throughout the South during 1868 but flared up around the time of national and local elections. During the presidential campaign of 1868, the Klan killed, wounded, or destroyed the property of thousands of people and turned the tide in favor of the Democrats in several states and many counties. After Ulysses S. Grant assumed the presidency in 1869, however, the federal government began to move against the Klan. The Grant administration provided state and local militias with weaponry to use against the Klan. This approach differed from that of the previous administration, which had treated the Klan as a state and local problem. The U.S. Congress launched an investigation into the Klan and passed legislation to counter its activities. The Force Act of 1870 and the Ku Klux Klan Act of 1871 outlawed interfering with an individual's right to vote and allowed the use of the army to counter the Klan. The new powers also enabled Grant to suspend the writ of *habeas corpus* to fight the Klan, which he did in South Carolina.

Forrest disbanded the formal Klan probably in 1869, and with federal enforcement, the Klan had faded by 1872. It had done its damage, however. Countless black and white Republicans had been terrorized and tortured, and roughly 1,000 were killed, severely disrupting Republican organizations and black communities throughout the South. Many of the freed people fled to cities to escape the wrath of the Klan. Since local and state governments had been powerless against the Klan, those who lived in fear of the Klan had to turn to the federal government for help. As Northern sentiment turned against Radical Reconstruction, the federal government's ability to prevent violence waned. White Southerners, no longer disguised as Ku Klux Klansmen, used violence to redeem state governments in Alabama and Mississippi. By 1877 Reconstruction had ended. Life in the

South during the ensuing decades would bring a return to a degree of segregation and white supremacy not seen since the age of slavery. Democratic governments, Black Codes, and Jim Crow were the manifestations of black subservience for which the Ku Klux Klan rode.

The Klan in the 1920s

During the era of the New South and then during the turn of the century, a myth grew about Reconstruction in general and the Ku Klux Klan in particular. This myth held that the Klan saved the South from the tyrannical rule of demonic carpetbaggers, scalawags, Republicans, and especially African Americans. Instrumental in creating this myth was D.W. Griffith's 1915 film *Birth of a Nation.* Griffith's film was a cinematic masterpiece, an epic feature that revolutionized the movie industry. Its techniques, subject matter, style, and length were completely new, and it proved enormously popular across the nation. Based on Thomas Dixon's 1905 novel *The Clansman*, Griffith's film recounted the history of the United States beginning with the arrival of the first slaves through the "redemption" of the former states of the Confederacy in 1877. *Birth of a Nation* portrays African Americans of the Reconstruction South as brutes whose primary amusement is raping white women; Klan members are chivalric heroes who save the South from the barbaric black menace. Few white Americans disagreed with this portrayal, for it harmonized with many contemporary political, scholarly, and folk accounts of the Klan.

The popular impact of *Birth of a Nation* gave birth to a new interest in the Klan. A new generation of white southerners was eager to revive the white terror. William J. Simmons, a failed preacher and an organizer of fraternal organizations, brought Griffith's cinematic vision to reality. Simmons, whose father had been a Klansman in Alabama, later claimed to have had a vision of white-robed horsemen in the sky, inspiring him to follow in his father's footsteps. On Thanksgiving night, 1915, atop Stone Mountain outside of Atlanta, Georgia, Simmons and fifteen followers celebrated the rebirth of the Klan by burning a cross. Several days later he paid for a newspaper advertisement announcing the rebirth of the Klan in Atlanta. Simmons's announcement conveniently ran next to an advertisement for *Birth of a Nation.* At first, this second Ku Klux Klan had little purpose. Before and during World War I, the Klan differed little from other fraternal organizations of the time. The activities of the several thousand members focused mainly on building support for the war effort, including strikebreaking and parades. Only after tensions in the social, political, and cultural fabric of the United States expanded during the 1920s did the Klan become the largest right-wing movement in the history of the country.

Simmons had envisioned a nationwide following for the Klan. To make his vision reality, he embarked on a massive marketing campaign. Thanks to the mass-marketing skills of publicists Edward Young Clarke and Elizabeth Tyler, almost 100,000 American men had sent $10 each to become members of the hooded empire by 1921, making the Klan a substantial movement and a profitable organization. Salesmen recruited members, often approaching entire Protestant congregations at once. Klan-approved robes were sold, and rules were established. With this larger following came a new purpose for the Klan. Simmons redefined the Klan as the guardian of white women and the white race in the United States. Klansmen were to defend the white race from blacks, Jews, and Asians, and Klansmen swore to uphold traditional Protestant morals by fighting Communists, Catholics, anti-Prohibitionists, labor unions, and loose women.

This new mission statement can be traced directly to upheavals in the United States and the world after World War I. The influx of immigrants, many of them Catholic, posed a challenge to Protestant ethics. During the Great Migration of the 1920s African Americans moved north in unprecedented numbers. At the same time, the socioeconomic status of Jews began to rise. Organized crime and bootlegging thrived during the Prohibition era, and women—epitomized by the flapper—found new social, economic, and sexual freedom. Feeling surrounded by these changes that threatened the white male's grip on social hierarchy, white men across the United States turned to the Klan to fight the current of social change. Such a nativist reaction was part of the worldwide Fascist movement that would also ultimately grip to a greater degree Germany under Adolf Hitler, Italy under Benito Mussolini, and Spain under Francisco Franco.

Early in the 1920s, Klans across the country embarked on campaigns of violence not unlike those of the Reconstruction Klan. Klansmen tortured, mutilated, whipped, beat, and occasionally murdered those deemed a threat to their way of life. Klan activities included boycotts of Jewish-owned businesses and whippings of white men accused of beating their wives. While Klan violence was not as deadly as it had been during Reconstruction, the second Klan spread from Texas to Oregon to New York and stood

Police escort members of the Ku Klux Klan to a KKK rally in New York City on October 23, 1999. As the nation's oldest right-wing extremist group, the Klan in its various manifestations has fomented hatred and committed murder and violence against blacks, Jews, and Catholics for more than a hundred years. *(AP Wide World Photos)*

at more than 3 million by the mid-1920s. Klan activity was no longer concentrated solely in the South; Indiana boasted the largest Klan organization in the country. As Klan violence and publicity increased in 1920 and 1921, Congress commenced an investigation as it had during the height of the Reconstruction Klan. At hearings in Washington, D.C., Simmons charmed Congress, excusing the acts of terror as the work of small, rogue Klan groups. After the hearings, Klan membership continued to grow.

Although traditional concepts of gender and chivalry constituted primary tenets of the Ku Klux Klan movement, women played a crucial role during the second era of the Klan. Critical to the success of the Klan, the Women's Ku Klux Klan movement helped bring in new members and normalize the movement. These groups, often made up of the wives of Klan members, organized community functions such as Klan baseball games, picnics, and parades. These social gatherings brought new members to the Klan and presented to the public an image of a wholesome organization. For those in and out of the movement, these activities normalized the Klan. A picnic or a fair made the Klan seem normal and benign, thus decreasing the stigma associated with a violent, vigilante movement. Klanswomen also acted against the Klan's enemies. Their tactics consisted of rumor, gossip, and public demonstrations. Klanswomen presented their beliefs as moral and symbolic issues, attempting to obscure the political and violent nature of the male Ku Klux Klan. Most Klanswomen had a history in progressive endeavors, most often the suffrage and

temperance movements. These movements grew out of a defensive effort by white women to preserve white social status and political power from newly enfranchised immigrants and African Americans. For women in these movements, joining the Klan simply meant taking the next step in a long fight to protect their social status.

In 1922, Hiram Evans, a dentist from Dallas, Texas, became the Klan's Imperial Wizard. At this time, Klan activity moved from the violent to the political. The Klan threw its massive network behind political candidates across the country. Alabama, California, Georgia, and Oregon featured governors elected with the Klan's backing. U.S. senators from Indiana and Texas openly professed their Klan membership, and just before his appointment as U.S. Supreme Court justice, Hugo Black renounced his Klan membership. At the Democratic convention of 1924, Klan members arrived in New York City hoping to play an essential role in nominating the presidential candidate. Instead, fistfights broke out between the Democratic Klansmen of the South and West and the Catholic, anti-Prohibitionist Democrats of the East. Despite the fiasco in New York City, Klan candidates fared well in the election, winning Senate seats and governorships in Colorado, Indiana, Kansas, Kentucky, and Oklahoma. In 1925, 40,000 Klansmen marched in full regalia down Pennsylvania Avenue in Washington, D.C.

By 1928, however, Klan membership had dwindled to just several hundred thousand members. Legal battles between Evans, Clarke, and Simmons over Klan copyright ownership cost the organization credibility and prestige. More damaging was the revelation that Klan leaders had not paid taxes on any of the enormous profits they had made. Finally, prominent Klan leaders found themselves caught in scandals. D.C. Stephenson, the leader of the Klan in Indiana, went to jail convicted of second-degree murder in 1925. Press coverage no longer worked in the Klan's favor: headlines describing Klan atrocities revolted the public, damaging the organization's popularity. While the Klan lost the favor of many Americans, self-destruction only partially explains the Klan's demise. Social change had slowed by the mid-1920s. The social unrest and economic instability of the early 1920s gave way to almost a decade of uninterrupted economic growth and social stability. The turmoil that had spurred labor unrest, political radicalism, social and racial migration, and sexual freedom had begun to level off. This calming of the nation negated the need for the Klan's reactionary vision. Americans realized that the Red Scare did not result in a Communist revolution, and many rediscovered their religious roots during the revivalist movement. The Klan continued to rail against Communists during the Great Depression, but by the 1940s the Klan had died its second death. Its total victims during its second era can never be known, but rough estimates for particular states list about 1,000 assault victims in Texas and Oklahoma, more than 100 in each state of Florida, Georgia, and Alabama, and more than 20 in North Carolina.

The Klan After 1954

The U.S. Supreme Court's 1954 ruling in *Brown v. Board of Education* marked the beginning of the modern civil rights era in the United States. For the next fifteen years people across the nation fought for the civil rights of African Americans. In the process, legal segregation would die as Congress passed legislation aimed at ensuring equality. Many white southerners saw this movement as a death knell to their society and culture. Southern society had remained segregated and dominated by whites; little had changed since Democrats "redeemed" the South and ended Reconstruction. When U.S. citizens unleashed a deluge of activism aimed at integrating southern society, white southern men once again turned to the Ku Klux Klan to push back the forces of social change.

For this third incarnation of the Klan, there would be no national organization—local Klans formed and acted of their own volition. The symbols and tactics of the Klan remained: burning crosses, white hoods, and violent acts committed at night. Law enforcement often approved of Klan activities, and occasionally participated in them. Fires, stabbings, and beatings of blacks, including civil rights activists, were common across the South. Spurned by the middle class and business communities, Klan members relied solely on violence to intimidate and even kill civil rights activists. Bombing became a favorite weapon of Klansmen: between 1956 and 1963 they were responsible for over 125 bombings of churches, homes, and synagogues across the South. The most infamous bombing occurred in 1963 when a Klan bomb exploded at the Sixteenth Street Baptist Church in Birmingham, Alabama, killing four black schoolgirls. In 1964, civil rights workers James Chaney, Andrew Goodman, and Michael Schwerner disappeared near Philadelphia, Mississippi. Soon after their disappearance, the Federal Bureau of Investigation discovered that Klansmen had kidnapped the men, shot them each in the head, and buried their bodies in a dam. In 1965, four Klans-

men shot and killed Viola Liuzzo, a white woman from Detroit, Michigan, who had traveled to Alabama to aid in the civil rights movement.

Although the Klan committed notorious atrocities during the civil rights era, it never came close to the power or prestige of its previous incarnations. Outraged by the Klan, President Lyndon Johnson ordered federal prosecution of Klan members for violating the civil rights of U.S. citizens. Prosecution of Klan members continued during the 1970s and 1980s, making it difficult and dangerous for anyone to attempt another Klan revival.

By the late 1970s, most Americans would not tolerate sporadic Klan violence for fear it might lead to a revival of the hooded empire. Outraged by a 1979 attack on a Southern Christian Leadership Council march in Decatur, Alabama, a lawyer named Morris Dees founded Klanwatch, an initiative of the Southern Poverty Law Center (SPLC) in Montgomery. During the 1980s, Klanwatch monitored the activities of KKK groups (since the FBI had ceased to do so) and enacted litigation for violating the civil rights of its victims. Dees based these lawsuits on civil rights legislation passed during the Reconstruction era. Along with the Decatur incident, Klanwatch pursued Klansmen who killed five anti-Klan protesters in Greensboro, North Carolina, and Klansmen who lynched an African American named Michael Donald in Mobile, Alabama.

Various Klans retaliated against Dees by sending him death threats and burning down the SPLC headquarters. Undeterred, the SPLC proved the guilt of the Decatur Klansmen, resulting in various fines, and mandated racial sensitivity training. Klanwatch efforts in North Carolina led to the federal indictment of Klans in that state. Finally, the SPLC pursued the United Klans of America (UKA) in connection with the Donald lynching. Eventually, the UKA was ordered to pay Donald's mother $7 million in damages. Unable to do so, the UKA turned over its headquarters to her. By the late 1980s, Dees and the SPLC had left many local Klans throughout Alabama, Georgia, and North Carolina bankrupt and near collapse.

In March 2002, an Alabama jury convicted Bobby Frank Cherry, a former Klansman, of first-degree murder for the Sixteenth Street Baptist Church bombing of 1963 that killed four African-American schoolgirls. Cherry was sentenced to life in prison. Despite prosecution and widespread public disapproval, modern Ku Klux Klan groups, largely reorganized as right-wing, paramilitary groups, remain scattered across the rural United States.

Militia Movement

The right-wing U.S. militia movement is and has been a fairly narrow movement to arm citizens, form paramilitary groups, and train these groups to defend themselves, their families, and their communities from the threat of governmental oppression. Indeed, one working definition of militia groups suggests that militia groups are "any group of three or more persons organized for the stated purpose of defending their rights and property from tyrannical government. Such a group must also engage in paramilitary training and/or maneuvers to prepare for 'unlawful' behavior on the part of government agents. Finally, the group must also call itself 'a militia' and consider its legal right to organize and train as a militia to be specified under the Second Amendment to the U.S. Constitution." However, the militia movement is typically referred to as the militant arm of a broader Patriot movement that includes groups as diverse as the John Birch Society, Radical Common Law groups, Liberty Lobby, strict Constitutionalists, and anti-tax protesters, among others. This article examines the precursor groups and ideas that gave birth to right-wing militia groups in the 1990s, the evolution of the movement, and its current status as well as future prospects. Questions to be addressed include who participates in the movement, what do they do (political behavior as well as group social activity, training, etc.), what ties do they have to mainstream political groups (i.e., land rights, hunting groups, National Rifle Association, etc.), and how has government responded to these groups, with a particular focus on law enforcement efforts.

Movement Roots and Precursor Groups

From the establishment of the American colonies in the seventeenth and eighteenth centuries, Americans have generally not trusted government. In fact, the American colonies essentially used fairly small paramilitary units to engage in a guerrilla war against a faraway government they viewed as illegitimate and unrepresentative of their interests. The governmental system these early Americans constructed also reflected distrust of government, with many of the founders believing that "government is a necessary evil" that must have its authority limited by ensuring that power is dispersed among governmental institutions and across levels of government. In this way, no one person or group should be able to take the full reins of government and abuse its power.

This basic political culture is embedded in American society and politics, and can be viewed in modern debates over everything from social welfare policy to government regulation of access to and use of firearms. And although the rise of the modern state has created a national government that has ensured the nation's common defense during world wars, the Cold War, and the terrorist attacks of September 11, 2001, there is still a conception among Americans that individuals have a right, if not an obligation, to arm themselves for the nation's common defense, as well as the defense of themselves, their families, and their property. Fears concerning both the inability of the national government to defend against Communism and power-grabs of the United Nations, as well as the potential threat posed by the federal government to American citizens, have led some to believe that all Americans, but especially white men, have an obligation to arm and train themselves against evil forces, foreign or domestic. The right-wing militia movement in America is rooted in a belief that the militia movement began and operates under some basic antigovernment and self-defense principles that have been widely accepted by some in this country for over 200 years.

Precursor Groups and the Foundations of Militia Movement Beliefs 1930–1990

Citizen militias are only the most recent manifestation of paramilitary right-wing extremist groups in the United States. In fact, paramilitary right-wing groups have a long history in the United States. The first such groups formed after the Civil War and generally took on some variation of a Ku Klux Klan (KKK) name. The KKK arose from the hardships created for whites by the Civil War, and citizen militias too have risen in response to threats, both real and perceived, such as the "attack" on white male privilege and the economic uncertainty created by competition in a global marketplace.

Throughout its rise in the late 1860s and its second surge in the early 1900s, the Klan typically operated as a paramilitary group, arming and training its members to harass, injure, and kill African Americans and white sympathizers throughout the South. And although the Klan did not use military uniforms at the time, the white robes and hoods clearly identified members as part of a distinct organization. But the use of paramilitary structure by factions of the KKK was most evident beginning in the 1970s as the "New Klan" adopted military garb and structure under the guidance of David Duke. Further, it was also during the 1970s that the KKK began recruiting from military bases for the first time—a practice emulated by the militia movement in the 1990s.

Citizen militia groups also share characteristics of another movement that arose during a period of economic uncertainty and social unrest. During the 1930s, some Nazi "Shirt" groups, such as William Dudley Pelley's Silver Shirts, were created based on a semimilitary structure. Fears over a Communist invasion of the United States during the height of the Cold War also led to the formation of new far-right paramilitary groups, and these groups can be said to be the true grandfathers of the 1990s militia movement—the Minutemen and the Secret Army Organization (SAO).

The SAO formed as a secretive paramilitary group in 1967. However, the group remained small and operated solely in Southern California through 1972. SAO was far more aggressive than the Minutemen, and frequently engaged in espionage of left-wing groups, raised money through criminal activity, and used physical violence against its perceived enemies more frequently. Although law enforcement had not infiltrated the group as much as they had the Minutemen, SAO's violent actions quickly meant most of its members were taken off the streets for common criminal violations.

Robert DePugh is reported to have obtained the idea for developing paramilitary units in the 1960s during a duck-hunting trip. One hunter commented

ROBERT DEPUGH (1923–)

Robert DePugh is a long-standing right-wing activist who was born and raised in Missouri. He is best known for creating the Minutemen in the 1960s. The Minutemen were a paramilitary group formed to protect citizens from a Communist invasion. DePugh and his followers believed that Communists had infiltrated the federal government so completely that they would be able to overrun the country without resistance from the U.S. military. Most scholars believe that the Minutemen served as the godfather to the 1990s militia movement. DePugh served in the military during World War II, but was discharged for persistent psychological problems. In 1953, he founded a company called Biolab Corporation and produced food supplements.

In 1960, DePugh's disgust with the United States' handling of Fidel Castro in Cuba led him to form the Minutemen. The Minutemen were designed to resist a Communist invasion by stockpiling and training with weapons, but they also developed a spy network for tracking Communist activities in the United States, especially in the halls of government. DePugh brought his Minutemen together at a California training camp in 1964. His paramilitary activities led leaders of the John Birch Society to believe he wanted to take over the organization, and the subsequent infighting led DePugh to split with the group and form a new political party called the Patriotic Party.

Although the Minutemen remained small, their secretive cells and calls for violence led federal law enforcement to take notice. Agents infiltrated the group, and their activities eventually led to firearms and robbery charges against DePugh. DePugh was imprisoned from 1969 to 1973, during which the organization he had created collapsed. DePugh spent the remainder of the 1970s starting and running several businesses in Missouri. By the 1980s, he tried to reassert himself into right-wing politics, but he was no longer held in the same reverence. In disgust, DePugh declared retirement from politics and focused on his businesses. His current whereabouts are unknown.

Donald P. Haider-Markel

that the hunting group had enough training to survive in the wild and fight a guerrilla war against invading Russian forces. DePugh reportedly loved the idea and subsequently organized the Minutemen in Missouri and began training camps in the early 1960s. Like militias, DePugh organized his Minutemen into secret cells of five to twenty-five members, armed them heavily, and trained them for war against perceived threats of invasions by Communist forces. Although DePugh maintained a national headquarters for the group, only one member of each cell would have contact with DePugh or other cells, and the national organization would simply recruit members for individual cells. This structure, which was adopted by some left-wing terrorist groups in the 1970s, was intended to make infiltration difficult, if not impossible. Also like militias, Minutemen trained on weekends and stored huge caches of food, weapons, and other supplies to ensure long-term survival when the Communist invasion occurred.

The Minutemen believed the federal government had become far too liberal in its orientations, and they even threatened members of Congress who voted to dismantle the House Un-American Activities Committee, a special committee that had been investigating Communist infiltration of the federal government. Ironically, it was testimony before that committee by a Minutemen member and Federal Bureau of Investigation (FBI) informant that led to government infiltration of the group and its eventual downfall. The informant, Roy Frankhauser, had been a KKK member and reportedly tipped the FBI on three occasions when Minutemen cells had attempted to attack their perceived left-wing enemies through bombings and assassinations. FBI and Bureau of Alcohol, Tobacco and Firearms (BATF) infiltration of the group and the group's violent activities eventually led to the arrest and convictions of many members and DePugh. Once DePugh was in prison on weapons charges in the early 1970s, the basis for the movement collapsed. Although DePugh had often claimed to have 25,000 members in his organization, he once admitted that membership had peaked at 600, and law enforcement estimates placed the figure at 500.

Like militias, both the Minutemen and the SAO had espoused distrust of the federal government and were adamant about their right to bear arms. Indeed, DePugh once argued that the terrorist acts of the Minutemen were designed to "provoke the government into taking harsh and repressive measures against the general population so people will be turned against the government." And Minutemen literature in 1964 stated: "The time is past when the American people might have saved themselves by traditional political processes. The hopes of millions of Americans that the Communist tide could be stopped with ballots instead of bullets have turned to dust." However, right-wing paramilitary groups that would arise in the 1970s and 1980s were far more focused on the federal government as the main enemy, beliefs that the militia movement adopted.

The first such 1970s group was the Posse Comitatus (a Latin term meaning "the power of the county"). The Posse Comitatus actually began as two different groups formed by two different leaders in 1969—Henry L. (Mike) Beach and William Potter Gale. Beach, a former member of the Silver Shirt Legion, a pre–World War II American Fascist organization, formed a Posse group in Portland, Oregon, as a branch of his Citizen Law Enforcement and Research Committee. Gale, a follower of the new Christian Identity movement, formed the U.S. Christian Posse Association at nearly the same time. The Posse was organized around the protection of Second Amendment rights, a belief that the highest form of legitimate government was the county, with the sheriff at the lead, and typically espoused racist and anti-Semitic views. Posse members demonstrated their beliefs by refusing to pay state and federal taxes; a member, they believed, asserted his "sovereign" status as an individual by formally canceling government identification, such as Social Security cards, driver's licenses, marriage licenses, and vehicle licenses. Ridding themselves of these ties to the government established their "sovereign" citizen status, and thereby they were not subject to most government laws and regulations.

This legal fiction was based on a notion that the only true U.S. sovereign citizens were white Anglo-Saxon Christians, as opposed to nonwhites and Jews, who were considered citizens only because of the unconstitutional Fourteenth Amendment to the U.S. Constitution. Indeed, the Posse believed that the United States was not a democracy but instead a White Christian Republic. The refusal to maintain government identification and pay taxes led many Posse members into sometimes violent conflicts with law enforcement, and subsequently, to many members being jailed. Militia groups have copied the tactics of the Posse, especially in states like Michigan and Montana. Militia analyst Eckard Toy argues: "Posse members combined the survivalist's defensive posture with an aggressive effort to intimidate public officials through legal challenges and the public display of weapons. Located primarily in the geographic heart-

MARK KOERNKE (1957–)

(a.k.a. "Mark from Michigan")

Mark Koernke, who organized the secretive and well-equipped Michigan Militia-at-Large in 1994, is perhaps best known for his short-wave radio broadcasts (*Intelligence Report*), public access cable show, speeches around the country, and videotapes designed to recruit for militia groups. Born in 1957, Koernke served in the U.S. Army Reserves during the 1970s and early 1980s. After leaving the military, Koernke worked as a custodian at the University of Michigan until the mid-1990s when his militia recruiting activity provided enough income.

Koernke was one of the best-known leaders of the militia movement in the mid-1990s and deserves credit for the rapid growth in groups from 1994 to 1996. He got his start as a spokesperson for the right wing in 1991 when he served as a replacement speaker at a rally for fringe presidential candidate James "Bo" Gritz. Koernke soon began speaking at right-wing rallies in Michigan and in 1993, he released his first video, *America in Peril,* in which he outlined New World Order conspiracy theories about the federal government. The video was widely distributed at gun shows and survivalist expos, bringing Koernke national attention.

Although Koernke had been arrested on weapons and assault charges at various times, and lived underground for a period in the late 1990s, it was not until 2000 that his paranoia led him to jail. Koernke was mistaken for a bank robber, but instead of allowing the police to stop his car, Koernke started a high-speed chase that led to his arrest and conviction on charges of fleeing and eluding police, resisting arrest, and assault with a dangerous weapon. In April 2001, Koernke began serving what would be at least a three-year sentence. Although Koernke is currently in prison, his wife and son continue to send his message through public speeches, short-wave radio, and the Internet.

Donald P. Haider-Markel

land and the Pacific slope states, the Posse is a decentralized association of dozens of small groups." Stern offers multiple examples of militias using the same types of intimidation tactics and organizational structure, including ending ties with government to demonstrate sovereign status.

Modern militias are also similar to the Minutemen and the Posse in their ideologies. Toy argues: "seeking a wilderness haven . . . Minutemen and members of the Posse sought anonymity, armed themselves, and prepared for Armageddon. Varieties of religious millennialism blended easily with negative attitudes toward federal authority, which was often perceived as a subversive conspiracy of Jews and Communists." At its peak in 1975, the Posse claimed seventy-eight chapters in twenty-three states, and perhaps 30,000 members, mostly in rural midwestern and northwestern states.

The Posse's growth coincided with the emergence of a broader movement in the 1970s that came to be known as the Patriot Movement. This movement contained elements of the New Right that was emerging in American national politics, a growing survivalist Movement of disaffected white males, upset and terrified over the condition of the United States following the Vietnam War, and a resurgence of the Christian Identity Movement. The Christian Identity Movement originally began in 1946 with Wesley Swift's establishment of the Church of Jesus Christ Christian in California. Swift also adopted the paramilitary organization idea by forming a branch of his church called the Christian Defense League. After Swift's death in 1970, two of his followers created additional paramilitary units in California and Idaho. One follower, Richard G. Butler, copied many survivalists by moving his group to northern Idaho and creating the Church of Jesus Christ of the Aryan Nations. His group used both military dress and ritual, but most important, the group held a series of congresses for members of the Far Right, including neo-Nazis, KKK members, and others. The purpose of the 1983 congress was to create connections between right-wing groups in the Pacific states and the midwestern states, especially Michigan.

The ideology of the contemporary militia groups corresponds quite closely to that of the Christian Identity Movement. Both movements are staunch opponents of taxation, federal government agencies, and gun control, and both use rural areas as bases of operation. According to Brent Smith, author of *Terrorism in America: Pipe Bombs and Pipe Dreams* (1994), the Christian Identity Movement is a right-wing umbrella organization, tied to which are the Aryan Nations, Arizona Patriots, Covenant, Sword, and Arm of the Lord (CSA), the Order, Posse Comitatus, White Patriot Party, Skinhead youth, and various factions of the Ku Klux Klan.

Following the death of Posse activist Gordon Kahl in a shootout with federal agents in 1983, a few extremist members of the Christian Identity Movement

created the Order and embarked on a campaign of terrorism directed against liberals and the U.S. federal government and designed to raise money for the creation of a separate white state. The leader of the Order, Robert Mathews, had also formed a precursor right-wing paramilitary group called the Sons of Liberty in 1972 that conducted its training in the Arizona desert.

The forces driving the rise of paramilitary groups in the 1960s intertwined right-wing movements such as the Christian Identity Movement, the Patriot Movement, and the Survivalist Movement. Furthermore, the rural nature of these groups helped to expand their appeal in the 1980s as the farm crisis hit many families hard.

Government reacted to these paramilitary groups in a number of ways. All told, some seventy-five persons affiliated with a variety of these right-wing extremist groups were prosecuted for terrorist-related offenses in the 1980s. After committing a spree of illegal crimes, members of the Order were tracked down and eventually convicted for a number of crimes. Local, state, and federal law enforcement officials arrested a number of Posse, CSA, and KKK members on a variety of charges. In addition, twenty-four states passed laws outlawing paramilitary groups that train for the purpose of creating civil disturbance.

Most of these laws have three main components: (1) prevention of demonstrations on the use of deadly weapons for civil disorder, (2) prevention of assembling to train with or practice the use of weapons for civil disorder, and (3) definitions of civil disorder and the persons exempt from the statute, such as law enforcement officials. Toy suggests that these laws, combined with hate crime laws that punish crimes motivated by racial or ethnic bias, as well as federal and state law enforcement efforts, were the main reason for the demise of right-wing paramilitary groups in the late 1980s.

Citizen Militias: The Rebirth of Right-Wing Paramilitary Groups

From these earlier movements the citizen militia movement arose in an almost linear progression. As author David H. Bennett argues, "The belief that the U.S. government is a vast conspiracy, the tool of the racial enemy, and that true patriots must engage in paramilitary training for the day of reckoning to come" binds these paramilitary groups together. These views were part of a larger paramilitary culture in which white men began to believe that government would not protect them and a man would not be strong enough to take on all the enemies by himself; thus "He needed a private militia."

Although the exact seed that created militias in the 1990s may never be known for certain, most observers credit a few individuals and several key events from the early 1990s that created both the environment and the leadership for the movement. The events include (1) the farm crisis of the 1980s, (2) the recession of the late 1980s–early 1990s, (3) unhappiness with the Bush administration's inability to "finish the job" in the 1991 Gulf War and Bush's declaration of a New World Order—viewed by some as a signal for the start of a new world government in the United Nations, (4) the 1992 election of a perceived liberal Democrat in President Bill Clinton, (5) President Clinton's attacks on gun rights, including the passage of the Brady Bill and a new assault rifle ban in 1994, (6) the 1992 conflagration that erupted at Ruby Ridge, Idaho, when BATF agents attempted to arrest Randy Weaver on weapons charges, and (7) the tragic events at the Branch Davidian compound in Waco, Texas, in 1993, starting again with a BATF raid and ending with FBI agents trying to put a stop to a two-month standoff.

These events contributed to a growing belief that the federal government would use any means necessary to maintain a perceived economic, social, and political order as well as undermine U.S. sovereignty through the implementation of a United Nations (UN)-directed dictatorship. Central to the maintenance of federal government control and eventual UN takeover was the systematic confiscation of individually owned firearms—the very weapons by which citizens might protect themselves from a tyrannical federal government or from a UN takeover. Conspiracy theorists further argued that the UN takeover of the United States would be directed by the Illuminati, a secret conspiracy group, or by some type of secret ruling Jewish elite.

Capitalizing on these events, the militia movement arose from the membership, ideology, and leaders of earlier paramilitary organizations. In many areas, however, their rhetoric was and remains less extreme, allowing militias to recruit more politically moderate members. Most militia groups are separate organizations with no overarching organization or structure to tie groups together. Issues, however, appear to be the tie that binds militia groups together and with the paramilitary groups that came before them.

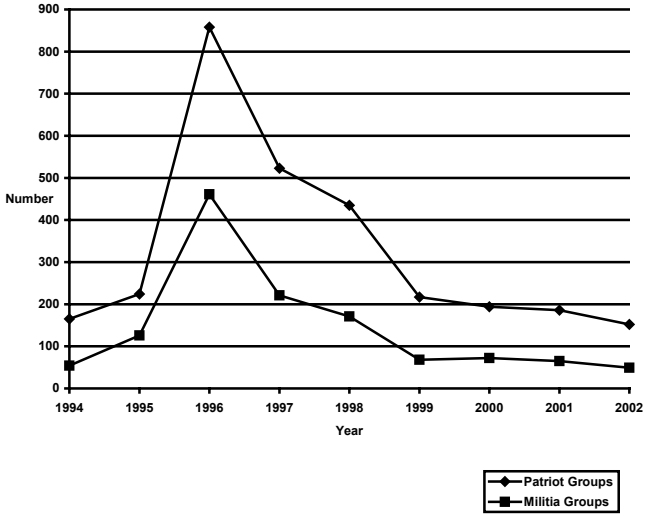
One particular figure that appears to have been key in the development of a militia movement is former Green Beret James "Bo" Gritz, who also had ties to the KKK. Gritz helped to mediate between authorities and the Weaver family at Ruby Ridge, and appears to have helped end the standoff. At the time Gritz was building a survivalist camp in central Idaho and traveled across the country conducting weapons and survivalist training. Gritz and others argued that the disaster at Ruby Ridge was proof of a federal government out of control. Some of these leaders, drawn from violent right-wing and racist groups of the 1980s, such as the KKK and Aryan Nations, held a meeting in Estes Park, Colorado, in October 1992 following Ruby Ridge to discuss a response to federal government actions. About 150 people attended. It was at this meeting that the idea for private militia groups was developed as a means of protecting citizens from events like Ruby Ridge. The key leader to suggest the militia concept at the meeting appears to have been Larry Pratt, a retired state legislator from Virginia who later became president of Gun Owners of America. In its tamest sense, right-wing leaders were calling for the formation of militias to act as an armed "neighborhood watch" group.

Following the 1992 meeting, no militia groups immediately formed, but the seed had been planted for the creation of a militia movement. During 1993 and 1994, the federal government appeared to confirm the worst fears of far-right leaders with the events at Waco and the election of President Clinton and his pursuit and successful passage of the first significant gun control laws in twenty years. Some of the first-known militia groups subsequently formed in early 1994, including the Militia of Montana and the Michigan Militia.

As more groups formed throughout 1994 and 1995, Bo Gritz began traveling the country speaking to existing groups and groups of men seeking to form new groups, calling for the execution of the "tyrants" responsible for the Branch Davidian debacle at Waco, Texas, as well as Ruby Ridge. By late 1994 and early 1995, estimates of the number of persons belonging to citizen militias ranged from 10,000 to 40,000 across thirty states. However, some private groups put the number at 100,000 persons, and the BATF estimated that by the end of 1995 militia groups were operating in forty states. At the time, leaders of the militia movement estimated their members in the millions and claimed there were groups operating in all fifty states. Although exact figures will never be known, it does seem clear that by 1995 the movement claimed tens of thousands of members and was active across much of the country in over 100 armed groups. States with the most activity were Michigan, Montana, and California. Most groups have tended to be fairly small, with fewer than fifty members. For example, the Washington State Militia, from Deming, Washington, maintained ten to fifteen members in 1995 and 1996, but often held meetings with visiting members of other militia groups that put meeting attendance at twenty-five to thirty persons. The Michigan Militia, which often claimed to have over 10,000 members in 1995, could never document more than fifty to seventy-five regular members participating in activities, such as paramilitary training.

Figure 1 tracks the growth and decline in the number of militia groups and groups involved in the broader patriot movement, which includes Common Law Courts, Christian Identity groups, and the like. The trends indicate rapid growth between 1994 and 1996, but a fairly steady decline thereafter. Interestingly, the numbers of militia groups and patriot groups grew after the April 19, 1995, bombing of the federal building in Oklahoma City, even though many in the news media suggested that groups became sparse following the bombing. In fact, many militia groups did go underground after the bombing, but largely only in terms of speaking with the news me-

Figure 1. Patriot and Militia Groups, 1994 to 2002



Note: The count of Patriot Groups includes militia groups as well as right-wing survivalist groups, Radical Common Law groups, Liberty Lobby, strict Constitutionalists, and anti-tax protestors, among others.

JOHN TROCHMANN (1943–)

John Trochmann was a cofounder (with his wife, brother, and nephew) of the Militia of Montana (a.k.a. MOM) and has been the most visible leader of the group. Trochmann was born in 1943, grew up in Minnesota, and served in the U.S. Navy during the height of the Cold War as a mechanic and a flight engineer. In the 1960s, he left the military and returned to Minnesota, where he established a business as a mechanic and ran a racecar track.

In 1988, Trochmann followed his brother David in a move to Montana. Although Trochmann apparently always had an interest in politics and a firm distrust of the federal government, it was not until 1990 that he began speaking publicly about threats to American liberty. During that year Trochmann attended an Aryan Nations Congress at the group's compound in Idaho and appears to have supported the group's white supremacist beliefs. Trochmann downplayed his ties to Aryan Nations, but Aryan Nations leader Richard Butler has said that that Trochmann had been to the group's compound frequently and that he had helped Butler and others to write rules of conduct for the compound.

Following the events at Ruby Ridge and Waco, Trochmann's view that individual liberty was in peril became solidified. However, he also believed that few Americans were paying much attention. He responded by moving to Alaska with the intent of avoiding the reach of the federal government. But Trochmann quickly realized that Waco had inspired some antigovernment activists to begin speaking out. He also saw the media turn more critical of the government. Trochmann decided to return to Montana and put his political beliefs into action by helping to found a new paramilitary group that could both provide information and physically defend itself from the government. MOM was subsequently formed in January 1994. Trochmann soon began traveling the country promoting the notion of citizen militias, and MOM began selling and distributing literature and videotapes on the dangerous activities of the federal government. By December 1994, MOM had also sponsored a five-stop speaking tour in Washington and Montana with Mark Koernke (from the Michigan Militia), whose videos and speeches were key for recruiting new militia members and forming new militia groups.

In 1995, local authorities arrested Trochmann for conspiring to interfere with justice—a charge that was based on Trochmann's affiliation with a member of the Montana Freemen. The charges were later dropped for lack of evidence. Despite the arrest and continuing claims about his racist ties, Trochmann continues to be the main spokesman for MOM, traveling the country and appearing in videotapes and literature addressing issues as diverse as "surviving martial law" to learning the basics of first aid in the field.

Donald P. Haider-Markel

dia. Also, the number of groups grew slightly in the eighteen months prior to the new millennium, perhaps fueled by fears of pending disaster with the Y2K bug in many computer systems.

Militia groups in the 1990s were quite diverse in their membership, tactics, and activity, ranging from relatively peaceful organizations helping with disaster relief to groups focused almost solely on paramilitary training. Leaders tended to range from former KKK members to former U.S. military personnel to unemployed shoe salesmen. Some groups, such as the Militia of Montana (aka MOM), led by John Trochmann, reportedly had ties with racist and anti-Semitic groups like the Aryan Nations. But leaders of other militia groups, such as the South Carolina militia, went out of their way to dissociate themselves from racists and in some cases, purged their membership ranks of racist sympathizers.

Although most militia groups have focused on holding meetings, recruiting members, training members, and communicating informally with other militia groups, some groups have also attempted to offer services to their communities, such as shoveling snow for the elderly. Some groups have even participated in relatively mainstream political activities. For example, militia groups had publicly supported U.S. Representative Helen Chenoweth (R-ID) and her strong stances against environmentalists, environmental regulations, federal law enforcement agents, restrictions on the use of federal land, and even her congressional hearings on the existence of so-called black helicopters that militia groups insisted were the first wave of a UN takeover. Another interesting example occurred in New Mexico. Following the governor's veto of a 1996 bill to enhance penalties for hate crimes, the Albuquerque City Council considered a similar measure. Both the state measure and the local proposal were opposed by a coalition of conservative groups, including the New Mexico Christian Coalition and several members of the New Mexico Militia, who

provided testimony against the policy proposals. However, the examples of mainstream political participation by militia groups and their members are few, and most groups have in fact encouraged their members not to engage in any mainstream interactions with government, including holding a driver's license.

Most militia groups formed by first establishing a broad-based meeting to introduce the philosophy and purpose of militia groups. For nearly all groups, this entailed outlining a narrow interpretation of the U.S. Constitution, opposition to federal taxes, a belief that the county is the highest form of legitimate government, and opposition to gun control. Additional elements of the projected philosophy often included discussions of a UN-led New World Order, environmental regulation and extremism practiced by environmental activists, adherence to a Christian belief system, and opposition to morally objectionable behavior, such as legalized abortion. Many militia leaders also emphasized distributive justice premised on the notion that people should be rewarded in accordance with the value of their labor. This view is grounded in the Protestant work ethic and is a reflection of their Christian fundamentalist beliefs. Central to this ideology, then, is opposition to such federal government programs as Affirmative Action and welfare. Consequently, the movement's desire to maintain government fiscal responsibilities at the local level has been consistent with their anti-tax, anti-federal government sentiments.

The next step usually involved the establishment of localized autonomous cells, the form of leaderless resistance practiced by the Minutemen and often the Posse Comitatus. Each cell might range from five to twenty-five persons. Each cell is then responsible for building its own cache of weapons and supplies, as well as engaging in training. However, this general pattern is based on those groups that have allowed for some amount of public visibility, and more secretive groups may have been formed or operate in different ways.

Since 1994, recruitment of members for the groups has taken many forms, including flyers posted in public, announcements through right-wing shortwave radio broadcasts, announcements in right-wing periodicals, homemade videotapes and pamphlets (often distributed at gun shows), and word of mouth. However, the movement quickly understood the power of the Internet and World Wide Web to advertise philosophy and recruit members. The Internet has also served as an inexpensive way to communicate quickly with existing members and groups across the country.

Both leaders and members of the militia movement have largely been white males, but there have been a few female, African-American, and Native American leaders and members. With few exceptions, the movement's base has been rural, with centers in small towns. Participants tend to have some experience with military or police training, but most participants' experience with firearms was obtained through sport hunting. The movement has tended to draw participants from the lower middle class, and members tend to have high school educations, but little or no college education.

Thus, the characteristics of the typical militia member do not differ significantly from right-wing groups of the 1970s and 1980s. In his study of terrorism, Smith noted that 1970s and 1980s right-wing terrorists tended to possess below-average education and income levels. Only 12 percent possessed a college degree, and 33 percent had a GED equivalent or less. Furthermore, many of those in Smith's study were unemployed or impoverished self-employed workers, which is consistent with what is known about militia members.

In the 1990s, the media and Congress also focused on a perception that militias tend to attract and recruit Vietnam vets. Writer Peter Doskoch refers to this as the "Rambo fantasy." Indeed, some commanders of militias, such as "Bo" Gritz of Idaho, are veterans of that conflict. But the general pattern appears to fit a recruitment of persons with military experience, especially veterans of the 1991 Gulf War. Furthermore, higher levels of militia activity across the states have been associated with having more liberal representation in the state legislature, higher levels of membership in the National Rifle Association, and a greater propensity for violence or terroristic behavior in a state.

Oklahoma City and the Aftermath

On April 19, 1995, at 9:02 A.M., a bomb decimated the Alfred P. Murrah Building in Oklahoma City. The investigation, trials, and convictions that followed revealed that two American citizens, Timothy McVeigh and Terry Nichols, were responsible for the deadliest act of political violence on American soil up to that historical point. McVeigh and Nichols, who both espoused ideologies consistent with the Patriot movement and who had attended militia group meetings, were eventually deemed responsible for the deaths of 168 men, women, and children. The date of the bomb-

In the deadliest terrorist act on American soil in the twentieth century, a car bomb destroyed the Alfred P. Murrah Building in Oklahoma City on April 19, 1995, killing 168 men, women, and children. *(AP Wide World Photos)*

ing had been selected because it was the second anniversary of the firestorm in Waco, Texas, that killed most of the Branch Davidians who had held the FBI at bay. Although McVeigh and Nichols appear to have acted alone, their ties to militia groups led to intensive media and congressional investigations of the militia movement, which in turn spawned a significant crackdown by law enforcement agencies on militia groups and their members.

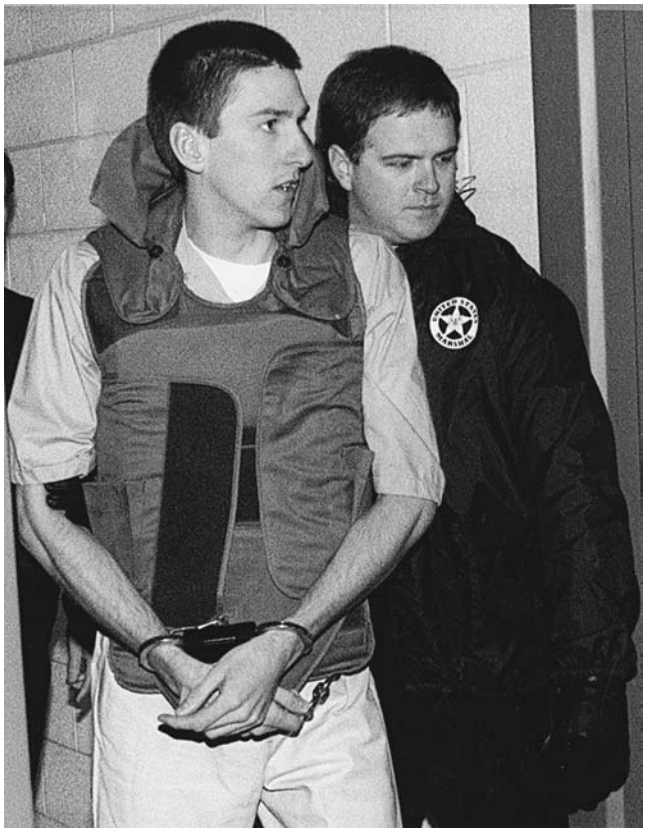
Following the bombing, some of the militias still held their meetings openly, while others went underground in light of increased surveillance, infiltration, and threats of harassment and arrest on the part of state and federal government authorities. As noted in Figure 1, the number of militia groups actually rose in the months following the bombing, but by 1997 militia activity began to decline. Much of the decline can be attributed to significant law enforcement efforts against the militia movement, with intensive investigations leading to significant arrests across the country. However, law enforcement officials in some states, such as Michigan and Wisconsin, reported no decline in militia group membership figures between 1996 and 1997. Moreover, as the number of militia groups declined, the number of hate groups, including neo-Nazi, KKK, and Christian identity groups, increased

after a sharp decline from the early to mid-1990s. This pattern suggests that hardened members of militias may have fled the groups because of law enforcement scrutiny and joined like-minded hate groups in the late 1990s. But evidence supporting this trend is anecdotal at best.

Even as the number of militia groups and members appeared to decline, in some ways their presence increased. As the Internet became more popular in the late 1990s, more and more militia groups found it to be a convenient bully pulpit. For example, the Minnesota Minuteman Militia created a sophisticated website from a small Minnesota town (less than sixty people) that stated the group's mission as follows: "to uphold and protect, from enemies foreign and domestic, the original constitutions of the state of Minnesota and the united States of America" (the group does not capitalize the 'U' in United). The Web site displays "three men in assault garb with automatic weapons, about to break through a door. They are wearing U.S. Bureau of Alcohol, Tobacco and Firearms jackets and United Nations Armbands." Militias seem to understand that the Web sites give them credibility, and between 1996 and 1999 the number of militia Web sites more than doubled.

Infiltration and pursuit of militias appeared to have the greatest impact, leading to paranoia and finger-pointing within militia groups. Those who stayed in the militias following Oklahoma City appeared to be more willing to take violent offensive action against the federal government, making them easier targets for law enforcement officials. Examples of law enforcement crackdowns include the 1996 arrests of seven members of the West Virginia militia for plotting to blow up an FBI facility and transport explosives over state lines, the 1996 arrests and convictions of three leaders of the Militia-at-Large for the Republic of Georgia for conspiracy to construct explosive devices for distribution among militia groups, the July 1996 arrests of twelve members of an Arizona militia group called Viper Team on weapons and explosive violations—ten pled guilty—and the July 1996 arrests of four members and the leader of the Washington State Militia on weapons and explosives charges.

The BATF's arrests of the Viper militia members represented the largest bust of a right-wing terrorist group in the United States since the Order in the 1980s. BATF agents had infiltrated the group and discovered that they were stockpiling firearms and explosive devices, and conducting surveillance and intelligence-gathering missions targeting state and federal government buildings, as well as intelligence on law enforcement threats to the group. The Viper militia had been training in Arizona since 1994, often developing and exploding devices that might be used in a future attack against the government. The group had also developed lists of political officials and liberal organizations and activists that should be targets for elimination. A partial listing of the items held by the group included almost 150 firearms, thousands of rounds of ammunition, over 1,200 pounds of explosives, grenades and launchers, body armor, gas masks, and surveillance videos of government buildings with narratives on bomb placement.



A U.S. marshal escorts accused Oklahoma City bomber Timothy McVeigh to a court hearing. McVeigh was later convicted and executed for the crime. *(AP Wide World Photos)*

At the end of 1996, four members of the Oklahoma Constitutional Militia were convicted and sentenced for construction and possession of explosives. One of the group's intended targets was a liberal antimilitia group. A Michigan militia member was arrested in March 1997 for making explosives which he planned to use on a Michigan federal building, Internal Revenue Service (IRS) building, televi-

sion station, and federal armory. In April 1997, agents in California arrested a militia member and fellow extremists with enough explosives to level three city blocks. A Texas militia group called the Republic of Texas began a standoff with state police in April 1997 after kidnapping a couple near their compound. Six members of the group were eventually arrested, and another was killed in a shootout with police. In July 1997 militia members were arrested after attempting to invade Fort Hood in Texas. The militia group had planned several army fort invasions to assassinate foreign troops that they believed were training for a U.S. takeover. In March 1998, several members of the North American Militia of Southwestern Michigan were arrested on firearms violations and were reportedly conspiring to bomb several federal buildings in the state.

In one bizarre case, four members of the 14th Regiment of the Indiana State Militia were arrested in 2000 after BATF agents discovered that members were selling drugs, planning the assassination of one of their own members, and trying to develop biological weapons and use those weapons to attack a controversial play that portrayed Jesus as homosexual. Finally, the infamous William Cooper, who had been a member of the militia group the Second Continental Army of the Republic, and who had used his publications and short-wave radio program to argue that the government had blown up the federal building in Oklahoma City and that mind-control devices were being used to establish the New World Order, was killed in a shootout with county police in November 2001. Cooper had been charged with federal tax evasion, bank fraud, and threats with a firearm. Just before sheriff's deputies tried to arrest Cooper, he sent e-mails to his friends stating that "I will . . . try to kill as many as I can before they kill me."

But there were other reasons for the decline in militia activity. Mark Potok of the Southern Poverty Law Center (SPLC), a group that monitors extremist groups, suggests that "there are hundreds of men who got tired of dressing up in camos [camouflage outfits] and waiting for the revolution that never came, and now have gone back to watching TV with their families and drinking beer at home. . . . And the patriot groups, as a general proposition [became] more like hate groups. There's clearly a hardening of the movement. It's a leaner, meaner movement." Additional literature from the SPLC website suggests that militias have declined because (1) members of the militia movement are getting older and have been forced to devote more time to finding stable income sources, (2) hard-core members have gone underground and their activities are hidden from law enforcement and watchdog groups, and (3) some members have transferred their allegiance to more traditional "hate" groups, or new hate groups with racist ideologies.

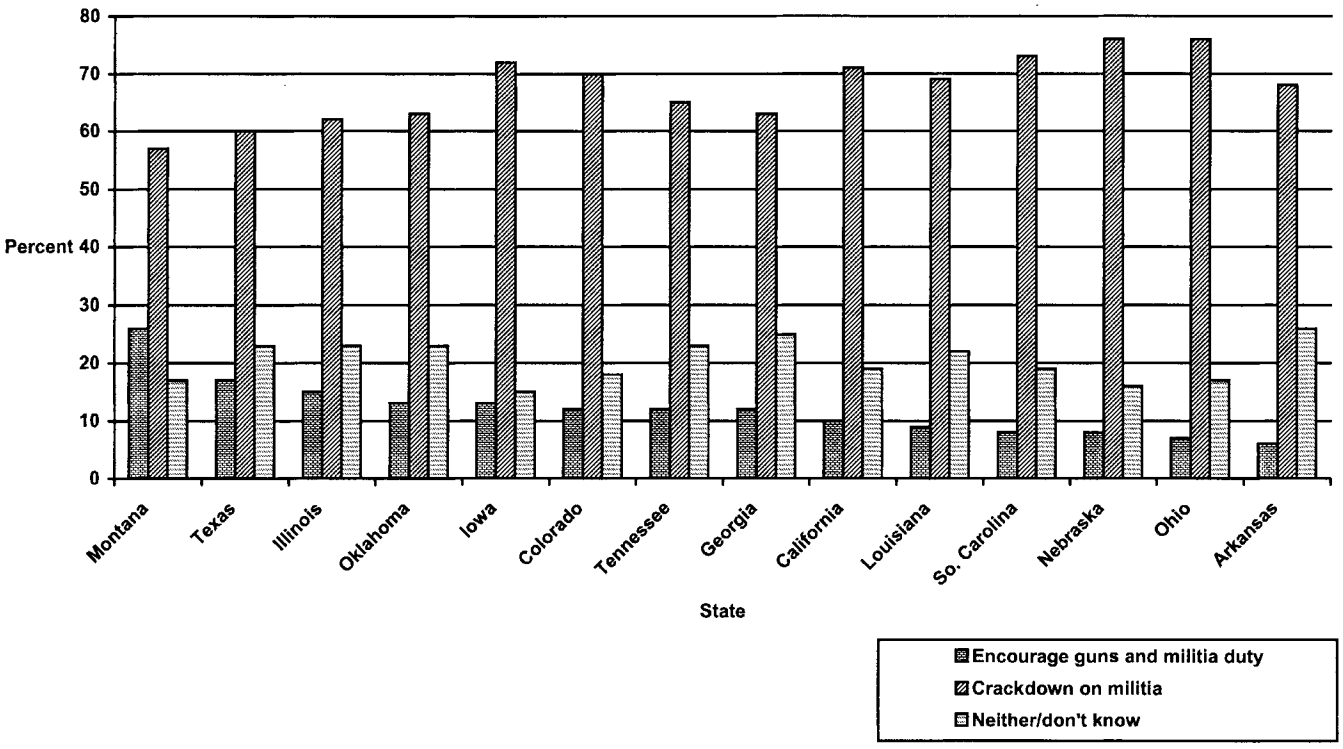
Public Opinion and Militias

Some observers believe that the decline in militias was also a result of declining public support, or at least growing opposition to armed groups of citizens training for a war with the government. Following the Oklahoma City bombing, public opinion began to more strongly support law enforcement crackdowns on militias, even though many Americans supported the principles espoused by militias. Support for crackdowns also varied by states. Between April and July 1995, an independent survey firm, Political/Media Research Inc., asked adults in several states to respond to militia-related survey questions. The variation in responses to one question was particularly interesting. The full question asked in each state was: "Which of the following statements comes closest to your view point: state government should encourage [state residents] to own guns because everyone should be equipped for "militia" duty, [or] the state should crack down on unregulated citizen militia?" Respondents could agree with either statement or indicate neither or don't know. The distribution of responses across a number of states is shown in Figure 2.

The survey results reveal several interesting patterns for the limited number of states available. First, across all states where the survey was conducted, clear majorities of adults support a law enforcement crackdown on militia groups—the lowest percentage of respondents supporting a crackdown was 57 percent in Montana. Second, even so, in each state at least 6 percent of respondents said that the statement "state government should encourage [state residents] to own guns because everyone should be equipped for 'militia' duty" was closest to their point of view. At this level of support, we should find about 20,000 militia supporters around the country. Finally, in some states, such as Montana, Texas, and Illinois, support for militias was much higher, ranging from 15 to 26 percent, suggesting these states would also have greater militia activity. Research on militia activity supports the fact that these states have relatively higher amounts of militia activity. As such, we can conclude that increased public support of militia groups translates into greater militia activity in a state, and vice versa.

National opinion polls on militia groups and mi-

Figure 2. Support for Militias or for a Government Crackdown on Militias by State, 1995



Note: Data compiled by the author from state surveys of adults conducted by Political/Media Research Inc. in May 1995. The Montana survey was conducted in April 1995 and the Oklahoma survey was conducted in July 1995. All samples are greater than 800 persons. The full question asked in each state was: "Which of the following statements comes closest to your view point: state government should encourage [state residents] to own guns because everyone should be equipped for "militia" duty, [or] the state should crackdown on unregulated citizen militia?"

litia activity also suggest some interesting trends. Responses to a number of surveys conducted by independent research firms between 1995 and 1998 are displayed in Table 1. When adults were asked whether they were sympathetic to a lot of the concerns voiced by militias in 1995, 13 percent said they were, while 82 percent said they were not. In 1996, slightly more people were sympathetic, and significantly fewer were not sympathetic. This shift tracks the growth in militias between 1995 and 1996. Furthermore, by 1998 a plurality of the public was sympathetic to the concerns raised by militias about the federal government, suggesting that militias had tapped into significant public discontent about the activities and size of the federal government, even as militia activity was declining.

About 19 percent of adults in 1998 disagreed that militias pose a threat and should be monitored, and fully 24 percent of the public believed that militias have the right to defend themselves against the federal government if the group has not broken any laws. In 1995 about 20 percent of the public did not believe that militias were racist or extremist, and they described militia members as patriots. Although clear majorities described militias as dangerous, crazy, or lacking in good intentions in 1995, a full 30 percent of the public did describe militias as well intentioned. Between 1995 and 1998, favorable opinions of militias did decline slightly, and the percentage of adults indicating that militias pose a threat increased significantly. Interestingly, and consistent with previous research, members of the National Rifle Association had a more favorable opinion of militias than the general population, and men had a more favorable opinion than women. Finally, although majorities thought the federal government should spy on these groups and/or force them to disband in 1995, over a quarter of the public disagreed with these statements, suggesting significant minority opposition to harsh government measures against militias.

In summary, although public support for militias declined in the 1990s and support for stronger government measures against militias tended to increase, the survey data also suggest that a significant minor-

TABLE 1. National Opinions Concerning Militia Groups, 1995 to 1998

Question	Agree	Disagree
Sympathetic to a lot of the militias' concerns (1995)	13%	82%
Sympathetic to a lot of the militias' concerns (1996)	16%	76%
Sympathetic to a lot of the militias' concerns about the federal government (1998)	49%	47%
Militia groups pose a threat and should be monitored (1998)	78%	19%
Militias that have not broken laws have a right to use force to defend themselves against the federal government (1998)	24%	70%
Militias have a racist or extremist agenda (1998)	74%	19%
Would describe militia members as patriots (1995)	21%	55%
Would describe militia members as dangerous (1995)	80%	11%
Would describe militia members as crazy (1995)	55%	33%
Would describe militias as well intentioned (1995)	30%	58%
Favorable opinion of militias (1995)	11%	65%
Favorable opinion of militias (NRA members only) (1995)	20%	55%
Favorable opinion of militias (1998)	9%	83%
Militias pose a threat (1995)	63%	26%
Militias pose a threat (1997)	85%	12%
Federal government should spy on these groups (1995)	68%	26%
Federal government should force groups to disband (1995)	36%	56%

Notes: Data compiled by the author based on national surveys of adults conducted by independent research firms and described in *Polling the Nation, 1986–1998* (1999). Those respondents indicating "don't know" or refusing to answer are not included in the percentages listed. Exact question wording varies slightly.

ity of the public is sympathetic to militia groups and their activities. Furthermore, even larger portions of the public appear to believe that some of the concerns raised by militias, especially those involving the federal government, are legitimate concerns. As such, militias have indeed tapped into traditional American beliefs that question a large and powerful national government. Finally, the general decline in public support for militias and their concerns coincides with the decline in militia activity in the late 1990s and suggests that militia activity is not likely to increase in the near future.

2003 AND BEYOND

Although the United States faces new threats in the form of international terrorism, the impetus and desire for American citizens to join and expand the militia movement has declined considerably. Unless new domestic threats provide a source for new mobilization, it seems unlikely that the militia movement will enjoy even the limited support it had during the mid-1990s. Some militias are still very active in training and the sale of patriot and antigovernment literature and Internet usage is increasing, but the movement is in decline and it appears that this trend will continue.

The militia movement has raised concerns about government power and abuses that tap relatively mainstream American fears about government, especially the federal government. This fact suggests that the militia movement, or some other similar movement, is likely to find enough supporters to survive. Similar to other right-wing as well as left-wing movements, the militia movement does not need broad-based support to survive; rather it only needs a significant sympathetic minority that is willing to voice support or actually join groups.

The militia movement was clearly the offshoot of previous and existing right-wing movements, and even if militias themselves disappear, it seems clear that similar right-wing movements, espousing similar antigovernment rhetoric, will arise in their place. In addition, even if militias themselves disappear, the broader patriot movement that spawned militia groups will continue to survive. Finally, one should also consider the fact that most acts of domestic terrorism in the United States have been committed by relatively small groups of individuals, acting on the margins of broader left- and right-wing political movements. So even as militias decline, the potential threat may not. For example, the FBI believes that a domestic terrorist sent the strains of deadly Anthrax through the U.S. mail in the fall of 2001. And the targets, major news outlets and Democratic leaders in Congress, suggest that the individual or group is affiliated with right-wing politics. Furthermore, as the U.S. war on international terrorism becomes more pervasive, and law enforcement is given more tools that may infringe on civil liberties, the motivation for

antigovernment extremists will likely rise as well, perhaps renewing militia fears of tyrannical federal government agents.

Global Justice Movement

Introduction

The global justice movement is one of the largest and most diverse social change movements in existence today, having brought hundreds of thousands of activists into the streets worldwide since the turn of the millennium. It brings together a wide variety of individuals and groups, including nongovernmental organizations (NGOs) from both the developed and developing world, direct action coalitions, environmental advocates, antiracist activists, women's groups, organized labor, religious groups, and student and youth activists. Although global justice activists focus on many different specific issues, they are united in their demand for direct democracy and the active participation of citizens in making decisions about issues that affect their lives and livelihoods.

The movement is united in its opposition to the growth of free trade on a global basis—conventionally known as neoliberalism—and the increasing power and influence that corporations hold in the system. Proponents of global justice believe that the opening up of free markets by international financial institutions and multinational corporations must not come at the expense of the greater exploitation of workers (child labor, unsafe working conditions, abysmally low wages) and the destruction of the environment. The movement's targets include the International Monetary Fund (IMF), the World Bank, the World Trade Organization (WTO), trade agreements such as the Free Trade Area of the Americas (FTAA), and international governmental bodies such as the Group of Eight (G8). Transnational corporations have also come under fire from advocates of global justice, in particular those in the oil and biotechnology industries, those associated with unfair labor practices, and those (such as fast-food franchise McDonald's) seen to represent American cultural hegemony.

Free Trade Versus Fair Trade

According to global justice activists, the IMF and World Bank have not achieved their stated goal of alleviating worldwide poverty, but rather have worsened the economic divide between the global north and the global south. Free-trade agreements, they argue, have benefited the rich at the expense of the poor. Because global economic policies impact so many different areas of life, the global justice movement has brought together activists concerned with a wide range of issues that affect the peoples of the world: from workers' rights, drug patents, and food security to developing-country debt, environmental degradation, and indigenous self-determination.

Workers' rights has been a cornerstone of the global justice movement, as exemplified by the fight against sweatshops. With the weakening of trade barriers, U.S. and European corporations have increasingly moved their production facilities to developing countries in the global south, where workers are paid much lower wages and often labor in substandard conditions. Under international trade agreements, regulations intended to protect workers have in some cases been judged to constitute restraint of trade. Groups such as Sweatshop Watch and United Students Against Sweatshops have organized to protest such abuses, targeting corporations such as the Gap and Nike.

Other targets of global justice activists are debt and the structural adjustment programs (SAPs) imposed on developing countries by international financial institutions. These policies often require countries to cut spending on social services and encourage a shift from farming for local consumption to production for export markets. Instead of *free trade*, which only augments corporate profits, activists demand *fair trade*, which would allow workers and their communities to benefit from their own labor. One example is the Fair Trade Coffee campaign, which has harnessed the buying power of consumers to promote environmentally sustainable coffee farming practices and ensure that small-scale growers earn a living wage. More generally, living wage campaigns for workers in

both the United States and the developing world have united myriad labor, human rights, religious, and community activists.

Intellectual property rules, such as the WTO's Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS), have also aroused growing opposition. Advocates for indigenous communities and proponents of human health and environmental sustainability have joined forces to oppose the patenting of plant varieties. Many activists also oppose genetically modified foods and the international trade rules that define regulations against altered products as a restraint of trade. On a related front, advocates for people with AIDS have actively campaigned against WTO intellectual property provisions that limit the developing world's access to inexpensive generic drugs.

The Evolution of a Movement

Activists have long been concerned about neoliberalism, particularly those in the global south. In Europe, the global justice movement came to the fore about a decade before it made headlines in the United States. In Berlin, for example, activists mobilized in large numbers against the World Bank and the IMF in 1988. But the current wave of global justice activism is often traced to the emergence of the Mexican Zapatistas (Ejercito Zapatista de Liberacion Nacional) in January 1994. The Zapatistas held two large global encounters in 1996 and 1997, the second of which gave rise to the Peoples' Global Action Against Free Trade (PGA) network, which has called for several worldwide days of action. The first day of action against the WTO was observed in Geneva and many developing countries, but received little notice in the United States.

The first global justice protest to gain widespread publicity in the United States was a series of actions against the WTO in Seattle in November 1999. The actions landed on the front pages as activist blockades succeeded in delaying the ministerial meetings, a small number of protesters damaged corporate storefronts, and police—later reinforced by the National Guard—unleashed clouds of tear gas. An estimated 50,000 protesters participated in the week of action, and some 500 were arrested. Thousands of activists mobilized by the Direct Action Network blocked the streets around the Seattle convention center and other meeting venues, while tens of thousands of organized labor demonstrators held a huge rally and march to the downtown area, and perhaps 100 black-bloc protesters went on a window-smashing rampage. The alliance of labor and environmental activists—the "Teamsters and Turtles" alliance—was particularly notable, given that the two groups had often maintained an adversarial relationship in the past.

While activists argued among themselves about the tactics used during the "Battle of Seattle," there is little doubt that the actions raised public awareness of the WTO and its policies to a level never before achieved. Seattle also galvanized a movement. The following two years saw major protests in many international cities, including Melbourne, Prague, Quebec City, Barcelona, Gothenburg, Genoa, Cancun, and Miami. Washington, D.C.—home of the World Bank and IMF headquarters—saw nearly annual mobilizations. The actions at the G8 meeting in Genoa in July 2001 proved a turning point for the movement, as activists faced an unprecedented level of police violence in a developed country, including the police shooting death of a young activist.

The terrorist attacks on the World Trade Center in New York City and the Pentagon on September 11, 2001, had a profound effect on the global justice movement. Many pundits—and some activists themselves—predicted the demise of global justice activism. Many larger, more established nongovernmental organizations (NGOs) and organized labor, sensing a more conservative political climate, pulled back from visible participation in global justice actions, as activists faced a rising level of state repression and more stringent laws justified by national security concerns.

From late 2001 through the middle of 2003, many global justice proponents shifted their focus to antiwar activism, using existing infrastructure and global networks to rapidly build a movement in opposition to the wars in Afghanistan and Iraq, the likes of which took years to coalesce during the Vietnam era. With the end of the active U.S. military engagement in Iraq in the spring of 2003, many antiwar activists once again returned to a more multi-issue focus, making explicit connections between overseas military conflict and local and global economic and social justice issues, and bringing along new allies and a growing popular awareness of "the big picture." Although critics have often characterized the movement as "anti-globalization," the global justice movement is built on international networking and solidarity—and the belief that economic progress in a few countries must not be allowed to proceed at the expense of the people and the environment elsewhere.

Causes and Conflicts

Given its size, diversity, and multiplicity of issues, the global justice movement faces several areas of conten-

tion. As with many movements for social change, moderate and radical elements often find themselves at odds over goals and tactics. Areas of conflict include the role of traditional Gandhian nonviolence tactics versus property destruction and battling the police; the role of the government and electoral politics versus decentralized grassroots activism; the prospects for a "kinder and gentler" capitalism versus socialism or communism; and the usefulness of reform versus revolutionary change. There has also been considerable debate about the relative merits of large, headline-grabbing protests outside international summits versus small-scale, community-based activism that appears less glamorous but may ultimately draw more grassroots participation and achieve more lasting social change.

The successes of the global justice movement are largely attributable to its decentralized character and its ability to accommodate a wide range of viewpoints and tactics. However, to date, the movement has largely focused on what it is against. Its primary challenge is not only to envision a more just and democratic world, but also to articulate that vision in a way that speaks to a broader range of people and to devise credible strategies for attaining it.

Liz Highleyman

Global Justice Movement: Overview

More than any political tendency in the past century, the global justice movement has brought together a wide range of activists concerned with issues ranging from workers' rights to participatory democracy to human rights to environmental preservation. One of the movement's most notable features is its decentralized, leaderless structure. Among the conflicts facing global justice activists are the issue of nonviolence, whether to focus on global or local struggles, and whether to reform or abolish corporate capitalism.

Beginning with the "Battle of Seattle" in November 1999, the turn of the century saw a series of multi-issue protests. The largest of these protests brought tens of thousands of activists into the streets—more than at any time since the Vietnam War.

Following the terrorist attacks of September 11, 2001, many pundits predicted the death of the global justice movement, but their pronouncements have proven premature. Although U.S. activists have been forced to reconsider whether massive protests are the best strategy, large actions continue in Europe and the global south (Latin America, Africa, and Asia). The movement has clearly succeeded in putting its issues before the public eye. The challenges now facing the global justice movement are the development of creative new tactics and the articulation of a vision of a better world.

What are the Issues?

Tying the various strands of the global justice movement together are opposition to economic neoliberalism and the increasing power and influence of corporate capitalism. Primary targets include global financial institutions such as the International Monetary Fund (IMF), the World Bank, and the World Trade Organization (WTO), as well as international trade agreements, governmental bodies, and major transnational corporations.

These global financial institutions provide an ideal impetus to bring together many different activists. In promoting free trade at all costs, they run roughshod over national and local laws regulating consumer safety, workers' rights, and environmental protection. In advocating for the free movement of capital and goods—but not of workers or consumers—they encourage corporations to shift production to poor countries, thus impoverishing workers in the developing world while undermining labor conditions in developed nations. With their structural adjustment programs (SAPs), they impose cutbacks in healthcare, education, and other social services. In addition, the institutions are undemocratic, with decisions made by an elite minority rather than those who are most directly affected.

Founded in 1944, the IMF and the World Bank were created to promote global development. Yet critics claim that the institutions have not lived up to their promise and have in fact worsened poverty and increased economic inequality. Global justice advocates are concerned with the crushing debt owed by poor countries, claiming that local resources should be used to improve local conditions rather than be sent out of the country to service debt. Many countries pay more in interest on debt than they do on health or education. In addition, critics charge that the IMF and World Bank encourage environmentally destructive projects such as dams and mining.

The World Trade Organization was formed in 1995 as an outgrowth of the Uruguay Round of the General Agreement on Tariffs and Trade (GATT). Through its dispute resolution process, the WTO imposes sanctions on countries that limit free trade. WTO rules forbid trade preferences that discriminate on the basis of manner of production or protective regulations. For example, the WTO governing body

Protesting the upcoming meeting of the World Trade Organization in Seattle, Washington, a demonstrator burns a pair of Gap pants on November 28, 1999. *(AP Wide World Photos)*

has ruled that the U.S. laws mandating the use of sea turtle exclusion devices in shrimp nets, a Massachusetts law banning state transactions with the dictatorial regime of Myanmar (Burma), and European countries' refusal to import hormone-treated U.S. beef are in violation of the organization's free trade provisions.

Global justice activists also oppose international trade agreements that favor corporate profits over the needs of people. A major target is the Free Trade Area of the Americas (FTAA), an impending agreement that will extend the North American Free Trade Agreement (NAFTA) to all of Central and South America. Critics contend that such agreements encourage corporations to move production to countries with few protections for workers and the environment, thus engendering a global "race to the bottom."

Opponents have been particularly critical of intellectual property rules such as the WTO's Trade-Related Aspects of Intellectual Property (TRIPS) provisions, which allow the patenting of indigenous plants and limit the availability of generic medications for people in poor countries. Activists also oppose the General Agreement on Trade and Services (GATS), which they contend will require the privatization of public services such as healthcare and education.

Global justice activists have also targeted international governmental bodies such as the European Union (EU) and the G8, made up of the world's wealthiest industrial countries plus Russia. Private institutions such as the World Economic Forum (WEF)—a gathering of government leaders and corporate heads—have also come under fire.

Transnational corporations have also been major movement targets; among them are agricultural giants Cargill and Monsanto, oil companies Exxon and Occidental Petroleum (for its attempts to drill on the lands of the indigenous U'wa people in Colombia), Nike (for producing shoes manufactured in sweatshops), the Gap (for connections to sweatshops and logging), McDonald's (for poor labor practices and more generally as a ubiquitous representative of American cultural imperialism), Starbucks (for pushing out local merchants and selling non–fair trade coffee), and Citibank (for involvement in numerous environmentally destructive projects).

Food security is an issue that unites many global justice activists. Activists are concerned about SAPs that pressure developing countries to grow crops for export instead of for local consumption, the "biopiracy" or patenting of plants and seed varieties, and trade agreements that require countries to accept genetically modified foods. The right to water is also becoming an increasingly important issue, as exemplified by construction giant Bechtel's 1999 attempt to privatize the water system in Cochabamba, Bolivia—a move thwarted by a popular uprising after water rates increased by as much as 200 to 300 percent.

Although the movement has often been characterized as being "anti-globalization," this is a misnomer. The global justice movement is built on international networking and cooperation. What it seeks is global democracy—"globalization from below"—rather than corporate globalization.

A Brief History

The global justice movement burst into public consciousness in the United States with the November

After smashing the window with a garbage can, a protester climbs into a Starbucks Coffee shop in Seattle on November 30, 1999. The "Battle of Seattle" drew international attention to the global justice movement. *(AP Wide World Photos)*

1999 protests against the WTO in Seattle. An estimated 50,000 protesters turned out for the "Battle of Seattle," which became known for its "Teamsters and turtles" labor/environmentalist alliance and also for the massive use of tear gas by police and the property destruction carried out by a small number of Anarchists.

But the movement did not start in 1999. Protests against transnational financial institutions, trade agreements, and corporations took place in the global south and Europe for many years prior to Seattle. Although most of the protests in developing countries never received much U.S. media attention, a protest against the IMF in Berlin in 1988 rallied tens of thousands of demonstrators, offering a sign of what was to come.

The genesis of the current wave of global justice activism is often traced to the Zapatistas, a band of revolutionaries in Chiapas, Mexico, who announced their presence on January 1, 1994, the date NAFTA was implemented. The media-savvy Zapatistas successfully brought international public attention to the negative effects of neoliberal economic policies. In 1996 and 1997, the Zapatistas convened two large *encuentros*—"Encounters for Humanity and Against Neoliberalism"—that brought together activists from around the world to discuss how to resist detrimental global economic changes.

During a demonstration near the International Monetary Fund and World Bank buildings in Washington, D.C., on April 20, 2002, Indy Roberts waves a flag in protest of global trade policies. *(AP Wide World Photos)*

A network known as People's Global Action Against Free Trade and the WTO (PGA) was born in Geneva in 1998 as an outgrowth of the second *encuentro*. The group called for the first global day of action against the WTO in May 1998. While police and activists battled in the WTO's home city of Geneva and hundreds of thousands protested in developing countries, U.S. awareness and participation were minimal. But by the following year, the issue of corporate globalization had attracted increasing attention. PGA's second global day of action on June 18 (J18) coincided with a meeting of the G8. (Beginning with the June 18 protests, activists have taken to naming days of action by month and day: N30 for the November 30, 1999, Seattle WTO protests; S26 for the September 26, 2000, Prague IMF protests, and so on.) Protests took place in over 100 cities, including several in the United States. In August 1999, PGA met in Bangalore, India, to plan for the next global day of action: N30. In addition to actions against the WTO meeting in Seattle, protests were held throughout the world including India, the Philippines, and Argentina.

Following the "Battle of Seattle," other protests came fast and furious. Some of the major actions included demonstrations against the IMF and World Bank in Washington, D.C., in April 2000 (A16); protests coinciding with the Republican and Democratic conventions in Philadelphia and Los Angeles in the summer of 2000; demonstrations against the World Economic Forum (WEF) in Melbourne, Australia, in September 2000 (S11); protests against the IMF in Prague in September 2000 (S26); demonstrations

against a new EU treaty in Nice, France, in December 2000; and actions protesting the FTAA in Quebec City in April 2001. The summer of 2001 saw a series of protests in Europe that included demonstrations coinciding with an EU meeting in Gothenburg, Sweden, in June; protests against a World Bank meeting (which was canceled) in Barcelona, also in June; actions against the WEF in Salzburg, Austria, in July; and massive protests against the G8 in Genoa, Italy, in July.

The September 11 terrorist attacks on the World Trade Center and the Pentagon dealt a major blow to the burgeoning movement. The IMF canceled its meeting scheduled for Washington, D.C., in late September, and many activists in turn called off their planned protests. Nevertheless, actions have continued, with a protest against the WEF in New York City in February 2002, a large demonstration against the EU in Barcelona in March 2002, actions against the G8 in Canada in June 2002, and another round of IMF/World Bank demonstrations in Washington, D.C., in September 2002.

Who's Involved?

The global justice movement has brought together a wide range of constituencies, loosely referred to as "civil society." The diversity of the 1999 Seattle protests led Ralph Nader to claim, "There's never been an event in American history that has brought together so many disparate groups."

Civil Society

Many of the earliest groups to organize against economic neoliberalism were nongovernmental organizations (NGOs), especially those active in the global south. Some of the major participating U.S. NGOs include the Global Trade Watch division of Public Citizen, which played a major role in planning the Seattle protests; 50 Years Is Enough (the U.S. Network for Global Economic Justice); the Jubilee Network—possibly the first multinational effort in the developed world to focus on economic justice—which works for debt cancelation for poor countries; United for a Fair Economy; the antipoverty group Oxfam; CorpWatch; and Global Exchange, a nonprofit dedicated to promoting environmental, political, and social justice.

Groups associated with specific issues have also played a key role in the movement. A small sampling includes the environmental groups Rainforest Action Network and the Sierra Club; and Health Global Access Project (Health GAP) and the AIDS Coalition to Unleash Power (ACT UP), which work to make healthcare—in particular AIDS drugs—accessible in poor countries. International groups are legion, including the Landless Workers Movement (Movimento dos Trabalhadores Rurais Sem Terra) in Brazil and ATTAC, which advocates for a Tobin tax on capital gains from currency transactions.

For many activists, global justice work is grounded in their religious or spiritual beliefs. The Jubilee debt relief movement has strong religious associations. Numerous churches and synagogues have provided a base for teach-ins, activist housing, and other support.

While the global justice movement does not have an overall leader, several people have become well known as organizers, commentators, or spokespersons, including Maude Barlow of the Council of Canadians, Walden Bello of Focus on the Global South, Medea Benjamin of Global Exchange, French farmer Jose Bové, Global Trade Watch organizer Mike Dolan, Kevin Danaher of Global Exchange, Susan George of ATTAC, Anarchist author and activist David Graeber, author Naomi Klein, Cindy Milstein of the Institute for Social Ecology, *Guardian* columnist George Monbiot, agitator Michael Moore (not to be confused with the WTO director-general of the same name), Infoshop.org webmaster Chuck Munson, consumer advocate Ralph Nader, John Sellers of the Ruckus Society, David Solnit of Art and Revolution, Indian scientist and author Dr. Vandana Shiva, anticapitalist activist Jaggi Singh, pagan organizer and author Starhawk, Alli Starr of Art and Revolution, and Lori Wallach of Global Trade Watch.

Labor

Organized labor has played an interesting role in the global justice movement. Labor was very active in the 1999 Seattle protests, mobilizing an estimated 40,000 participants. Although union leaders diverted their march away from the downtown street actions, many workers ignored their orders and joined anyway. Seattle saw the birth of the widely heralded "Teamsters and turtles" alliance, bringing together labor and environmental activists who had previously been at odds because environmental regulations were believed to cost jobs. Organized labor recognized that international trade agreements such as NAFTA and FTAA pitted North American workers against workers in poor countries as jobs were exported to nations with low wages and few protective regulations.

Labor groups that have been active in the movement include Jobs with Justice; the International Brotherhood of Teamsters; the United Steelworkers of

America; the Union of Needletrades, Industrial and Textile Employees (UNITE); Service Employees International Union (SEIU); the United Auto Workers; the Canadian Auto Workers; and the International Workers of the World (IWW, also known as the Wobblies, an organization founded in the early twentieth century that continues to exist today).

Some critics contend that labor largely supports national protectionist measures and is not truly supportive of a broader progressive agenda. During the Clinton administration, organized labor was hesitant to be too critical of Democratic trade policies. Particularly after September 11, with the resulting upsurge in patriotism, labor has played a less active role in the movement.

Coalitions

Various coalitions have developed as umbrella groups to coordinate large protests. The Direct Action Network (DAN) was formed to organize direct action in Seattle. The Mobilization for Global Justice (MGJ) has coordinated several protests against the IMF and World Bank in their headquarters city of Washington, D.C. Another World Is Possible (AWIP) formed to plan the February 2002 protests against the WEF in New York City. At several protests beginning with Quebec City, many of the more militant factions of the movement have come together under the banner of the Anti-Capitalist Convergence (ACC).

Representation

The global justice movement has been characterized as a movement of young people, and indeed students and youth are well represented. Student anti-sweatshop organizers such as United Students Against Sweatshops have conducted successful campaigns to mandate better wages and improved conditions for workers who produce university logo clothing. Students Transforming and Resisting Corporations (STARC) is another active group. Yet despite its media portrayal, the movement is quite diverse in terms of age. Many veterans of the Vietnam War protests of the 1960s and 1970s, and the antinuclear, Central America, anti-apartheid, pro-choice, and AIDS activist movements of the ensuing years remain active. The Raging Grannies, a group of older women, have been popular participants at several actions.

Women across the world are heavily affected by economic neoliberalism, and they play a major role in the global justice movement. Women are well represented among both the movement's well-known organizers and spokespeople and among the rank and file—especially on an international level.

People of color also bear the brunt of corporate globalization. People of color from the global south make up a majority of the international movement, but the global justice movement in the United States remains largely white. This likely stems from several factors, including the fact that people of color may have more pressing local concerns, a lack of resources to travel to national actions, a justified concern that they are more likely to be the targets of police repression (especially true of immigrants), and a "culture clash" between people of color and white punk and hippie activists.

Given that lesbian, gay, bisexual, and transgender activists played a major role in the movements of the 1980s and 1990s—including ACT UP, Queer Nation, and the Lesbian Avengers—it is perhaps surprising that there is not a more visible queer presence in the global justice movement. Although there are many queer participants—including several key organizers and spokespeople—self-identified queer groups are underrepresented.

On the whole, the global justice movement represents a major shift away from the "identity politics" of the 1980s and 1990s. The movement has provided an opportunity for people of diverse identities to come together on the basis of shared issues and concerns.

The Militants

The black bloc has been a major focus of the mainstream media and the police. The black bloc is a tactic, not a specific group of individuals. Made up mostly of Anarchists and other antiauthoritarians, participants wear black clothing and masks and march in tight formation as an expression of anonymity and solidarity. In Seattle a group of black-clad protesters broke the windows of several banks and corporations, marked buildings with graffiti, and lit Dumpsters on fire. In Quebec City, the black bloc took the lead in tearing down the fence erected around the FTAA ministers' meeting and engaged in street fighting with the police. The actions of the black bloc have spurred considerable debate within the movement. However, at many North American protests the black bloc has carried out other forms of direct action with minimal or no property destruction.

The white overalls—also known as *tute bianche* in Italy, the White Overalls Movement Building Libertarian Effective Struggles (WOMBLES) in Britain, and Ya Basta!—are another segment of movement mili-

tants. These activists typically wear white jumpsuits, helmets, and body padding, and often carry shields. Their aim is not to fight with police, but rather to protect themselves as they attempt to push through police barricades to reach their target.

The black bloc and white overalls both originated in Europe, and these tactics are more widely adopted on the continent than in the United States. Protests against international financial institutions and government bodies in Europe during the summer of 2001 drew substantial black bloc and white overall participation. In Genoa black-clad rioters carried out considerable property destruction. Much of this activity (such as burning private cars) was uncharacteristic of the black bloc, leading many to suspect that police infiltrators and neofascists were using black bloc garb as a cover.

Anarchists have played a major role in the global justice movement. By no means are all Anarchist activists associated with the black bloc. Anarchist influence is also apparent in the decentralized, leaderless organizing that has characterized all of the large national and international protests. After September 11, several of the more mainstream NGOs opted to forego large actions, leaving the planning and logistics increasingly in the hands of Anarchist activists.

Interestingly, the cadre Socialist and Communist groups that many people most associate with left-wing activism—such as the International Socialist Organization, the Revolutionary Communist Party, and the Workers World Party/International Action Center—played a minor role in Seattle and in other early global justice protests, although they have since become more active in the movement.

Pagans, Puppets, and Pink Blocs

Global justice activists have pioneered several new and creative tactics. Among the most notable is Reclaim the Streets (RTS), which grew out of the rave scene and campaigns against road construction in England in the early 1990s. RTS aims to reclaim public space, often filling it with music and dancing to create temporary autonomous zones. RTS played a key role in organizing the 1999 J18 actions and has since been active at most large protests in North America and Europe.

Pagan and Wiccan activists have also been key participants in the movement. Utilizing magical activism, ritual, and creative tactics such as large public spiral dances, pagans have introduced an element of calm resolve to many protests. With their reverence for nature, some pagan activists have taken a special interest in opposing water privatization.

Highly visible features of many recent protests are the huge puppets representing everything from corporate criminals to Mother Earth. Groups such as Art and Revolution bring their artistic talents to large actions, often coordinating puppet-making workshops. Street theater is an important element, as exemplified by Billionaires for Bush (or Gore). At the Quebec City protest a "medieval bloc" created a large-wheeled catapult used to loft stuffed animals over the fence erected by police. Puppets, pagans, samba bands, radical cheerleaders, and others have taken to forming pink blocs at large actions, beginning with Prague in September 2000.

What Is It Like?

Creative Tactics

Beyond the street fighting and property destruction highlighted by the mainstream media, the global justice movement is perhaps best known for using blockades and lockdowns to disrupt meetings of financial institutions and government bodies. Actions are often characterized by a festive atmosphere—several have been billed as a "Carnival against Capitalism"—as activists try to create on a small scale the world they desire. As Starhawk described the Seattle protests, "The action included art, dance, celebration, song, ritual, and magic. It was more than a protest; it was an uprising of a vision of true abundance, a celebration of life and creativity and connection, that remained joyful in the face of brutality and brought alive the creative forces that can truly counter those of injustice and control." Humor, satire, and "culture jamming" are prominent features. In addition, major actions typically include a myriad of teach-ins, people's assemblies, concerts, and other gatherings.

Activists have moved away from mass arrest scenarios in which protesters sit or lie down near a strategic target and are voluntarily arrested with the goal of clogging the prisons or the courts. Most urban police forces are now able to handle large groups of arrestees, and the tactic has lost much of its effectiveness. Yet mass arrests do still occur, sometimes inadvertently. Activists have devised strategies of jail and court solidarity, using tactics such as hunger strikes or refusal to give their names in order to press demands such as access to lawyers, medical attention, or equal charges for everyone arrested.

As described by Anarchist activist David Graeber, "Where once it seemed that the only alternatives to

marching along with signs were either Gandhian nonviolent civil disobedience or outright insurrection, groups like the Direct Action Network, Reclaim the Streets, black blocs, and tute bianche have all, in their own ways, been trying to map out a completely new territory in between. They're attempting to invent what many call a 'new language' of civil disobedience, combining elements of street theatre, festival, and what can only be called non-violent warfare."

Decentralization

The global justice movement prides itself on its grassroots, decentralized structure. One of its distinguishing features is the lack of any overall leaders along the lines of a Dr. Martin Luther King Jr. The movement derives its strength from the concerted efforts of multiple autonomous individuals and affinity groups. As Starhawk described the Seattle actions, "leadership was invested in the group as a whole. People were empowered to make their own decisions, and the centralized structures were for coordination, not control. As a result, we had great flexibility and resilience, and many people were inspired to acts of courage they could never have been ordered to do."

The key element in the coordination of mass actions is the affinity group, a small collection of about five to twenty individuals who typically know and trust each other and share common politics and goals. Affinity groups, in turn, may be organized into "clusters" that work together to carry out a particular action. For example, during the Seattle protest the area surrounding the convention center where the WTO meeting was to take place was divided into thirteen "pie wedges," with different affinity group clusters taking responsibility for blockading the various sectors.

When coordinating a large protest, affinity group representatives typically meet in a spokescouncil to devise a plan of action. These representatives (called "spokes") are empowered to speak on behalf of their affinity group. The spokescouncil process allows affinity groups to remain autonomous—and often anonymous. Once an action begins, affinity groups may decide collectively whether and when to alter their strategy or end their participation.

Spokescouncils typically operate using a consensus-based process, which borrows heavily from feminist and Anarchist principles. Rather than relying on voting, the goal of consensus is to come up with a decision that is acceptable to everyone. Proposals are offered by a facilitator, and participants express their concerns, often putting forth "friendly amendments." Participants can choose to "stand aside" and let a proposal go forward even if they do not completely agree with it. However, if any participant has a major, principled objection, he or she can "block" the consensus.

Infrastructure

The global justice movement has put considerable effort into developing a supportive infrastructure. Before large actions, training sessions are typically held to teach activists about nonviolence, direct action techniques, first aid, legal issues, and jail solidarity. The Ruckus Society, formed in 1995, is devoted to training activists in skills ranging from how to scale a building for a banner-hang to how to design an effective Web site. During large actions, a "convergence center" is often set up wherein activists can gather to collect information about events and make puppets, signs, and other visuals. Groups such as Food Not Bombs and Seeds for Peace may provide food for all participants.

Beginning in Seattle, street medics—who range from people with basic first aid training to emergency medical technicians to herbalists to medical doctors—have provided medical care for activists. Usually marked with red crosses, the medics have developed techniques for treating exposure to tear gas and pepper spray, and often set up clinics near protest sites to deal with more serious injuries.

Large actions typically also have a legal collective, such as the Just Cause Law Collective, to provide support and advice for arrested and jailed activists. Volunteer lawyers and law students may provide pre-action training and representation in court. Volunteer legal observers—often under the auspices of the National Lawyers Guild—watch for police abuse of protesters.

Communications and Independent Media

Far from being "anti-globalization," the movement's strength lies in its global networking and mastery of the means of communication. Such networking has been greatly facilitated by the use of modern tools such as cell phones and the Internet. Despite their lack of military might, the pioneering Zapatistas were able to capture worldwide attention through their use of the Internet. In addition to using e-mail and the web to plan and coordinate every aspect of large actions, "hacktivists" sympathetic to the cause also use the Internet to conduct cyber-actions such as e-mail "zaps" and "cyber-sit-ins" of corporate Web sites.

The movement has learned to "play to the media" with eye-catching visuals, sound bites, and well-

staged photo opportunities—techniques pioneered by media-savvy activists such as ACT UP. This phenomenon is not without controversy. Some oppose the focus on the "spectacle," complaining that despite activists' best efforts the mainstream media will always simplify the issues and focus on the most dramatic aspects of a protest such as street fighting, tear gas, and property destruction.

In response, global justice activists have created their own media. The Independent Media Center (IndyMedia) was born out of the Seattle protests, and local chapters have since cropped up throughout the United States and the world. Taking advantage of increasingly available and affordable technologies such as video and digital photography, media activists rapidly convey the protesters' message from the teach-ins and the streets to the Internet, print, radio, and public access television.

What Are the Conflicts?

The global justice movement faces several conflicts. After Seattle, some observers were concerned about right-wing activists who appeared to embrace their cause. Former presidential candidate Pat Buchanan, for example, has spoken against international trade agreements and the usurpation of national power by global financial institutions. Most global justice activists are aware that the Right does not share their values of inclusiveness and global democracy, and remain wary of alliances with conservatives. Other points of contention involve the role of NGO funding and its influence on the movement's agenda and the benefits and drawbacks of electoral politics—an issue that came to the fore when Nader ran for president as the Green Party candidate, which many believe contributed to the election of George W. Bush.

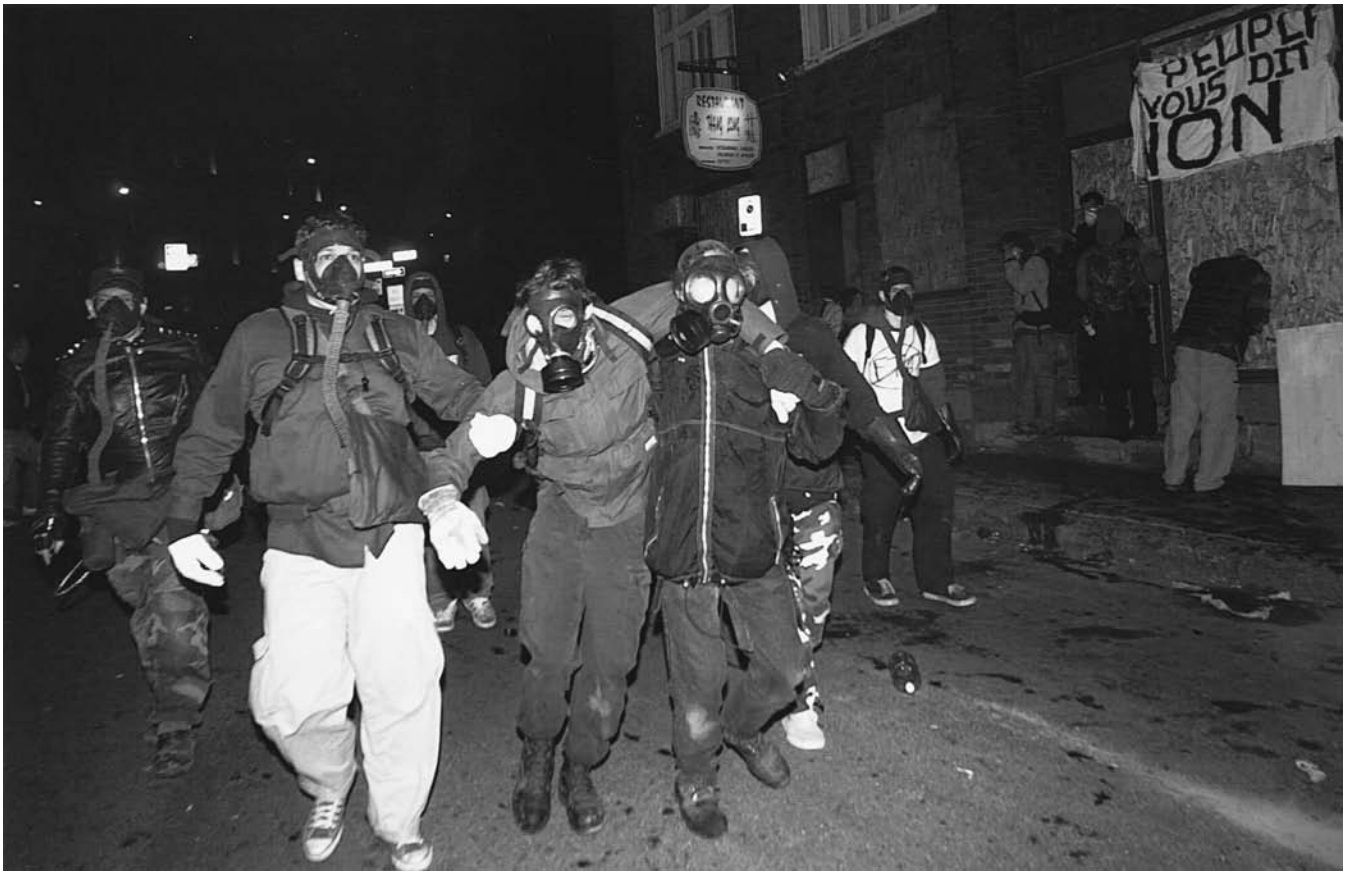
Nonviolence

The most contentious issue facing global justice activists is often couched in terms of violence versus nonviolence, but this is not really an accurate characterization. No one in the movement advocates harming people. The real crux of the debate concerns property destruction, and to a lesser extent fighting with the police.

During the "Battle of Seattle" window-smashing by a small group of activists became a major focus of mainstream media coverage, unleashing a flood of criticism from both within and outside the movement. Before the actions, activists working with DAN had agreed to a code of conduct that included no violence, physical or verbal, toward any person and no property destruction. Movement critics of the vandalism claimed that the decision was made democratically, and those who engaged in property destruction were therefore violating the common consensus. But not all participants had agreed to the guidelines, and some claimed that their efforts to critique the guidelines prior to the action had been rebuffed. On the streets some nonviolence advocates protected corporate storefronts and tried to physically restrain the window-breakers or have them arrested. Several, including Medea Benjamin of Global Exchange, strongly denounced the vandalism in the press in the months to follow.

Some nonviolence advocates come out of a long tradition of nonviolent civil disobedience in the Gandhian model, with strong religious or spiritual roots. They believe that engaging in violence of any sort causes activists to lose their moral integrity by resorting to the tactics of the authorities. Others look at nonviolence more from a strategic viewpoint. They claim that property destruction and battles with the police divert media attention from the issues at hand and that the mayhem costs the movement popular support and discourages new people from taking part. According to Benjamin after Seattle, "It was the nonviolent protest that stopped the WTO meeting in its tracks, and that was the big news . . . until the window-smashing diverted the media's attention."

Proponents of property destruction hold that only harm to people, not property, should be considered "violence." Some believe that property destruction is necessary to "break the spell" of reverence for property over people: "When we smash a window, we aim to destroy the thin veneer of legitimacy that surrounds private property rights." Most oppose vandalism against small shops, homes, and so on, instead directing their wrath at banks, oil companies, chain stores, fast-food outlets, and other "corporate criminals." They contend that property destruction pales in comparison to the violence committed by corporations and governments every day. They further claim the right to defend themselves when attacked by the police. Here, too, others take a strategic perspective. They claim that militant action inspires people to join the movement, and they point out that no matter how many tens of thousands of people attend a peaceful demonstration, the mainstream media pays little attention in the absence of property destruction and police battles. In the words of Anarchist activist Warcry, "I don't think Seattle would be on the map if it weren't for the catalyzing level of rage that was made visible through property destruction."



During confrontations with police in Quebec City, Canada, on April 20, 2001, demonstrators carry a wounded companion to safety after tearing down a security fence. Demonstrators protested against the Free Trade Area of the Americas, a pact under consideration by thirty-four heads of state gathered at the Summit of the Americas. *(AP Wide World Photos)*

After Seattle, proponents of nonviolence and advocates of property destruction seemed to be hopelessly at odds, but in the ensuing years many activists have sought a "middle ground." Both sides agree that the worst violence comes from the police, not the protesters. Many activists who generally support nonviolence feel that destruction of barriers used to control protesters and prevent them from communicating their message is justified. In Quebec City, the high fence erected around a large part of the city where FTAA ministers were meeting became the focus of outrage, and protesters of all stripes helped or supported those who tried to tear it down. "I thought people would only come to a mass action if it had clear nonviolence guidelines, but people came to Quebec City anyway," writes Starhawk. "I thought high levels of confrontation would lose us popular support, but we had the strongest support ever from the local people. I thought people new to direct action would be terrified by the level of conflict we experienced. But by the second day, more people were ready to go to the wall. By the third day, they were demanding better gas masks."

The Quebec City actions were the first at which the principle of "diversity of tactics" was embraced—the understanding that all protesters can carry out the type of actions they feel are most appropriate, as long as they do not impinge on other activists. Quebec City also saw the introduction of the idea of protest "zones": red for front-line actions likely to result in police confrontation and arrest; yellow for traditional civil disobedience; green for peaceful, permitted actions away from the front lines.

In Europe in the summer of 2001, a dramatically escalated level of police violence led many to reevaluate movement tactics. At the EU summit in Gothenburg, a protester was nonfatally shot by police, allegedly for throwing a rock. At the G8 actions in Genoa on July 20, a twenty-three-year-old protester named Carlo Guiliani was shot and killed by an even

younger policeman in a jeep, allegedly for attempting to throw a fire extinguisher at the police vehicle. The next night nearly 100 sleeping activists were brutally beaten by Italian police at a school used for housing by the Genoa Social Forum, leaving the walls covered in blood and the floor littered with teeth. Police claimed the assaulted activists were associated with the black bloc, which had carried out vandalism during the day. Clearly, the stakes had risen for all protesters, whether or not they personally engaged in property destruction. Genoa also made clear the risk of infiltration, especially of the black bloc, by agents provocateurs.

Although diversity of tactics has been adopted at several protests since Quebec City, many activists—including black bloc'ers—pulled back from confrontational actions after September 11. Some NGOs have even declined to participate in protests unless complete nonviolence can be assured.

Reform versus Revolution

Some activists aim to reform corporations and global financial institutions such as the IMF and WTO, making them more open and more responsive to concerns such as workers' rights and the environment. For example, reform-minded activists may call for the World Bank to cancel poor countries' debt or demand voluntary codes of conduct for overseas manufacturers to ameliorate sweatshop conditions. A prominent slogan of the Seattle protests was "Fix it or nix it," implying that changing the WTO was possible and desirable. Labor and large NGOs tend to embrace the pro-reform viewpoint.

Other activists believe that corporations and global financial institutions cannot be reformed and must instead be abolished. Anarchists, Socialists, and other political radicals tend to favor abolition. In fact, segments of the global justice movement have taken to calling it the anticapitalist movement (although by no means does everyone involved in the movement wish to abolish capitalism). According to the radical viewpoint, certain elements of corporate capitalism—such as the never-ending quest for growth and profit—cannot be changed without putting an end to the system as a whole.

A related issue concerns the role of national governments. Some on both the left and the right have criticized global financial institutions for undermining national sovereignty, for example, by overruling democratically established national regulations concerning workers' rights, purchasing preferences, or measures that protect national industries. Activists with a more Anarchist bent, however, are not concerned with erosion of state power, believing that government control is as pernicious as the rule of unbridled corporate capitalism.

The two sides of the "reform versus revolution" debate tend to favor different strategies. According to the radicals, transnational corporations and financial institutions will never put themselves out of business. Disillusioned by "protest as usual" that achieves results slowly and painstakingly, if at all, they argue for disruptive direct action that may include corporate property destruction and confrontation with the forces of law and order that defend state and corporate interests.

What Next?

The 2001 Genoa protests marked both a high and a low point for the growing movement. Never before had so many people—by some accounts, over 200,000—come together in a developed country to demand global justice. But likewise, never before had the modern movement in the West faced such harsh repression. The death of Carlo Guiliani and the police beatings that followed provided a rude wake-up call. Although violent repression of political dissidents is common in the global south—in fact, three student IMF protesters had been killed by police in Papua New Guinea the preceding month—it had not previously been experienced to such an extent by most activists in Europe or North America.

The terrorist events of September 11, 2001, marked yet another turning point, especially for U.S. activists. Commentators both within and outside the movement predicted the end of mass demonstrations, but despite increased pro-government sentiment an estimated 20,000 demonstrators turned out for the WEF meeting in New York City five months later, proving that protest is still possible. And in March 2002 an estimated 250,000 activists confronted the EU summit in Barcelona in the largest global justice protest in the West to date, surpassing even Genoa.

Changes in Tactics

Some global justice activists feel that mass protests have outlived their usefulness. They argue for a shift to local activism—focusing on issues such as environmental racism, the prison industrial complex, local strikes, and poverty at home—to replace "summit hopping," the culture of serial protesting that Naomi Klein has likened to "a movement of meeting-stalkers following the trade bureaucrats as if they were the Grateful Dead."

The "Battle of Seattle" succeeded based on its element of surprise, an advantage activists no longer possess. As Alexander Cockburn has noted, "Once in a generation you can catch the ruling class off guard. Then you spend twenty years paying for it." Since the April 2000 protests in Washington, D.C., police have barricaded the IMF headquarters to keep protesters away and ferried delegates in police-escorted buses. In Quebec City and Genoa, authorities erected a fence around a portion of the city. The November 2001 WTO meeting was held in Doha, Qatar—a country inaccessible to most activists and one that does not tolerate political dissent—and the June 2002 G8 summit took place in Kananaskis, a remote ski resort in the Canadian wilderness. It has become all but impossible to effectively shut down or even disrupt or delay a major summit as was done in Seattle.

Increased Repression

In addition to the decreased accessibility of financial and government meetings, activists are facing increased repression. Government officials have declared "no-protest zones," and police have carried out preemptive arrests before major actions. Protesters face the threat of tear gas, pepper spray, water cannons, batons, and dogs—although the repercussions of the "Battle of Seattle" led many police forces to rely on more targeted and less widespread control measures. During the 2000 Republican Convention, a few perceived organizers were arrested and held on bails of up to $1 million. And known activists increasingly face travel restrictions when they attempt to cross international borders. The USA PATRIOT Act of 2001, hastily passed in the wake of September 11, allows for greater surveillance and threatens to define activists as terrorists, leading many to predict the impending resurgence of COINTELPRO-type operations.

Notable Successes

Although the global justice movement faces many challenges, its successes cannot be denied. Obscure financial institutions unknown to most Americans a few short years ago have become a focus of media attention and public debate. Large actions have alerted the developing world to widespread economic inequity and the detrimental effects of unbridled free trade. Financial institutions and government bodies have been forced to acknowledge the protesters' grievances, although it remains to be seen whether their actions will follow their rhetoric. In his 2002 book *Globalization and Its Discontents*, Nobel laureate and former World Bank chief economist Joseph Stiglitz concedes that IMF/World Bank austerity policies have caused more suffering than they have alleviated, and he acknowledges that it was global justice protesters who made the developing world aware of the need for reform.

Since the 1999 Seattle actions, several major corporate scandals have erupted, contributing to a major stock market decline and implicating a number of government officials and their campaign contributors. In December 2001, massive protests erupted following the near-collapse of the economy of Argentina, once heralded as a model of successful IMF policy implementation. The middle class and working class alike revolted, leading to the police shootings of at least two protesters and the ouster of four presidents in a span of less than a month.

Writing in the wake of the September 2000 IMF actions in Washington, D.C., *New York Times* columnist Alan Murray said of the protesters, "[T]o a degree many of them still don't recognize, they have won the argument. Capitalism now has the black eye they tried so hard to give it."

A Vision for the Future

The events of September 11 led to a shift in focus for many global justice activists, who have increasingly devoted their efforts to opposition to U.S. wars in Afghanistan and Iraq and to solidarity with the people of Palestine. Yet interest in global justice issues—and their local manifestations—remains strong.

The tasks now facing activists include expanding the movement to include a greater diversity of participants and better definition of what the movement is for—not just what it's against. Global justice activists have often been criticized for lacking a coherent ideology and failing to articulate achievable alternatives to corporate capitalism. Most activists rightly argue that a unified ideology such as the Marxism of the last century is not a requirement for a postmodern movement. But the development of a vision of a more just, equitable, and democratic world—and a credible path to attain it—remains the global justice movement's most crucial challenge.

Living Wage Movement

Living wage campaigns have captured the imagination of organizations that represent low-wage workers. They have succeeded in establishing more than eighty governmental ordinances, and the movement has spread to universities, involving a growing cohort of students in local labor solidarity struggles for the first time in decades. The campaigns illuminate the possibility and importance of coalitions among labor movement, community, and religious organizations. This is no small feat given the immense animosity that has characterized these relationships in the past decades. Furthermore, coalition building is always difficult and coalitions are fragile, even when the partners are similar as in the case of labor unions and especially if they are dissimilar as in the case of the variety of groups involved in the World Trade Organization (WTO) protests.

That there are so many thriving campaigns and that most involve real coalitions among labor, community, and religious partners confirms the existence of a social movement, involving numerous individuals and groups throughout the country in sustained collective actions aimed at winning living wage legislation and monitoring its enforcement after enactment. The existence of so many ordinances indicates the success of this movement in achieving its immediate goals and raises important issues about both the possibilities and limits of this strategy for raising the standard of living for working people in the United States.

Background

Since the mid-1990s, cities and counties have passed living wage ordinances that require private sector firms that have financial relationships to government, as service contractors, recipients of subsidies or tax breaks, concessionaires, or tenants on publicly owned property, to provide a "living wage," a wage above the federally mandated minimum wage. Living wage legislation is generally initiated by either community-based organizations—such as the Industrial Area Foundation (IAF), the Association of Community Organizations for Reform Now (ACORN), and a wide range of local churches and neighborhood associations—or by labor unions, either particular unions or central labor councils (CLCs).

Successful campaigns seem to require the involvement of both types of organizations from the very beginning. It is hard to bring a missing partner aboard once the action has begun. Without the proper base in both the unions and the community, the campaign is less likely to be successful and the changes are less likely to be sustained. These campaigns are also more likely to succeed if they are bottom-up. This ensures continued demands for enforcement of legislation from those affected as well as contributing to the long-term construction of social networks and common interests that can be mobilized for future actions. If the campaign succeeds due to their joint efforts, they will develop greater commitment to and monitoring of ongoing policy and confidence in their capacity to make future change.

Labor Organizations

Labor has joined living wage coalitions for several reasons. The labor movement, reeling from declining membership, is eager to attract new members. As part of its recruitment strategy, the "new leadership" of the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO), elected in 1996, developed a Union Cities program to revitalize the role of unions in political and economic development. Labor's support for the living wage allows it to target previously ignored employment sectors such as low-wage service sectors where women and people of color predominate as well as employee groups whose employers have been particularly resistant to union organizing.

At a Santa Fe City Council meeting on February 26, 2003, eight-year-old Kyle Johnstone shows his support for a living wage ordinance. The living wage movement emerged in the 1990s to raise incomes of the nation's poorest workers. *(AP Wide World Photos)*

Labor's recent organizing involvement among low-income communities brings it into direct contact with traditional community organizers in these same communities. Because of labor's recent efforts to involve members of low-income communities, organizers increasingly draw upon younger people who practiced organizing in social movements at the neighborhood level. The alliances between labor and community have developed livable wage standards as an actionable agenda item. The new coalitions have also been critical for overcoming long-standing antagonisms between community and labor activists. The racism and sexism of many unions, their conflicting goals when it comes to urban renewal and other large construction projects that displace the poor without employing them, and their past indifference to service sector workers have proved an obstacle to organizing the very workers that the AFL-CIO now recognizes as providing the potential for the highest membership growth.

Living wage ordinances also help unions by setting norms about prevailing local wage levels. If employers are to compete for workers, they must offer employees higher pay. The living wage ordinance also empowers unionized city and county workers. In an era of privatization, where unionized public workforces see their numbers dwindling owing to outsourcing of their work, forcing contractors to pay living wages to their private employees levels the cost competition between public and private provision of services. Living wage laws make it less tempting for cities to privatize service provision, thus increasing union bargaining power.

From the labor movement's point of view, the living wage campaigns are most likely to be successful and sustained when linked with organizing drives,

which means that even failures in passing legislation can represent labor movement gains. Targeting living wage proposals to cover employees in firms where employers have blocked workers' attempts to organize attracts labor to the campaigns. In Houston, the ordinance lost citywide but won in low-wage neighborhoods. Moreover, the joint campaign with Service Employees International Union (SEIU) Local 100 helped the union succeed in its efforts to organize Head Start workers. In New Orleans, the community-labor coalition targeted hotel workers, which then became the focus of an organizing drive by Hotel and Restaurant Employees (HERE). The New Orleans campaign began in reaction to efforts by hotels, restaurants, and other hospitality industries to block unionization activities led by SEIU. In Santa Monica, California, the living wage covers employees of major beachfront employers who previously resisted unionization. In Oakland, California, where the ordinance passed in 1998, the effect was to frighten the Port Authority, which was not covered owing to provisions of the City Charter. Four years later, in 2002, the living wage coalition remobilized to pass Measure I, extending living wage coverage to Port employees.

Religious Organizations

Religious organizations are active in most, but not all, living wage campaigns. Besides providing occasions for demonstrating visible concern for the welfare needs of the poor and communities of color, living wage campaigns satisfy church organizational maintenance and enhancement needs. They provide opportunities for recruiting and retaining members within the inner-city neighborhoods by making the church relevant to their needs. The campaigns also afford churches opportunities to form alliances with community groups whose membership is partly shared, thus demonstrating solidarity on social and political issues. In addition, the campaigns offer direct community engagement in neighborhoods where their congregations historically have been located but where large shares of their membership no longer reside.

Congregations and parishes at the neighborhood level are represented both city- and countywide by councils of churches or diocesan associations that have been particularly active as coalition members. They act as advocacy groups promoting the living wage. They find allies who share their membership, they provide an outlet for direct action for their activist members, and they develop social networks that prove beneficial in their ongoing social service delivery activities.

Besides lending legitimacy and authority to living wage campaigns, church involvement provides significant contributions to organization building for campaigns. Church involvement allows preexisting congregational resources to be deployed in organizing efforts and expanded through social network linkages. Churches provide meeting places for campaign organizers and participants, and they recruit campaign activists from congregational rolls. They also provide venues for leadership training, offer financial and technical resources, and assist in developing social networks spanning neighborhood to citywide levels.

Community Organizations

National community-based organizations, such as IAF and ACORN, have resources and commitments to devise new and workable strategies for building a social movement of poor people. In addition to the potential for living wage laws to advance their social goals, they greatly benefit from highly visible participation in successful public campaigns such as living wage efforts. Their legitimacy and funding derive exclusively from efforts to mobilize community members for desired changes. Unlike churches, they have no other rationale for existence, and unlike successful unions, they cannot make legal claims to represent workers in formal negotiations over wages and other work issues. Community organizations lack structured opportunities for the maintenance of member participation (such as job sites for unions). Nor do they receive support as a by-product of deeply institutionalized behavior such as church attendance or union dues. Thus, community organizations must be highly responsive to community members' needs as they compete for participation and support.

Perhaps even more so than other coalition members, national community organizations with local chapters must be entrepreneurs, capable of quickly adopting campaign strategies that have proven successful elsewhere. With generally fewer ties to formal hierarchies and dependent on street-level participation, community organizations have much to gain from living wage campaigns, particularly those that generate substantial publicity on their positive contribution.

Several secular developments have also fueled community organization involvement in living wage campaigns. Among these developments are the steep reductions in government funding for welfare pro-

grams and poverty programs. As a result, low-income groups have been forced to articulate their own agendas from the bottom up and to search for allies from labor and religious organizations in pursuing new agendas. Community organizations' focus on the availability of jobs, the access their members have to the workforce, and the quality of employment (including living wage standards) have brought them in more direct contact with unions. The early history of living wage campaigns initiated by ACORN or IAF did not necessarily involve unions, however. This has largely changed. Some of the campaigns in which ACORN has been involved were initiated by the national AFL-CIO (e.g., Detroit), others by the CLC (e.g., San Jose, California), and still others by union locals and ACORN together (e.g., Cook County, Illinois), but all ultimately required a joint partnership and commitment of resources.

Coalitions

Coalitions appear to be critical to living wage victories and to long-term success as well. A vast majority of successful campaigns involved a mix of community, labor, and religious organizations. Once adopted, rarely are living wage ordinances implemented without a struggle led by a supportive coalition. Portland, Oregon, for example, effectively ignored the living wage ordinance. Without organized monitoring groups, the legislation was not enforced.

Despite numerous successes, tensions are inherent in coalition building. The concerns coalition partners have about each other depend in part on whether they are small local groups or larger-scale organizations and in part on whether they represent workers or residents or allies of those who will benefit rather than the primary beneficiaries. The tensions are also a result of the different and conflicting agendas of the allied organizations as well the history of relations among them. Many unions do not see enough for them in the living wage campaigns to justify serious or long-term involvement unless the campaigns are directly tied to organizing drives. Nor are the community groups always convinced of the benefits to them.

For example, in Los Angeles, the CLC initiated living wage campaigns around two large-scale projects that were receiving public subsidies: the extension of Los Angeles International Airport (LAX) and the development of the entertainment company Dreamworks. The aim of the labor movement was to ensure living wages not only for the construction workers but also for those involved in the janitorial services, concessions, and other occupations that would result from the projects, and they wanted to ensure job retention for those who joined the unions. Forming a coalition with community groups and churches, the CLC took the campaign to City Hall where they succeeded in winning a living wage ordinance and worker retention. However, they still have to ensure that contractors and vendors meet the terms.

The community groups involved were often in disagreement among themselves and with the unions about what protections their members would receive in regard to jobs and housing from these large-scale projects. The unions, especially those in the building trades, won protections under project labor agreements, special collective bargaining agreements unique to the building trades which established basic terms and conditions for all contractors on a specific construction project. The poor people affected by the projects received no such binding contractual coverage. Nor were the members of the community organizations confident that labor had formed an alliance with them for the long haul. Anthony Thigpenn of AGENDA, a community organization based in south Los Angeles, argues that the labor movement has to demonstrate the strategic and not just tactical advantages of coalitions. Such a demonstration requires a comprehensive and long-term regional development plan that serves the interests of both unions and communities.

Unions also have their share of concerns about the community organizations and their share of internal conflicts. When the IAF or ACORN is involved from the outset, unions have assurances that there will be allies able to plan and mobilize as full partners. When no such groups exist, the unions become more wary. Moreover, there are real differences of opinion among labor activists about the value of coalition politics. The internationals and the locals are not always in agreement about strategy. Sometimes the impetus comes from one and sometimes from the other; only occasionally are both in agreement. The AFL-CIO national, regional, and metropolitan offices add yet more layers in negotiating strategy. Even among some of the staff of CLCs committed to Union Cities with its emphasis on regional development and organizing, there is disagreement about the value of living wage campaigns. Unions have limited resources and must consider trade-offs. Should energy and resources be put into mobilizing for living wage campaigns or put straight into workplace organizing? When a first contract is under negotiation, should low-wage workers hold out

On June 7, 2002, living wage advocate Patrick Blum addressed the state Democratic convention in Madison, Wisconsin. *(AP Wide World Photos)*

for the higher living wage or settle for salaries lower than those mandated by a living wage ordinance but still representative of a victory for that local?

What Has Been Achieved?

By June 2002, there were over eighty ordinances on the books, counting precursors in Des Moines and Gary, Indiana. Sixty-five ordinances have passed since Baltimore in 1994, which is generally considered the first victory in the modern living wage movement.

Wages range from $6.15 (New Orleans) to $12.92/hour, assuming the employer pays health benefits, otherwise $11.42/hour (Santa Monica). Many are indexed to inflation or to the federally determined poverty level. Job categories covered are generally limited to janitorial, food service, security, parking lot attendants, hotel, restaurant, and clerical workers. However, a few ordinances include more; Chicago includes home healthcare workers, and Denver on-site childcare workers.

Thirty-five ordinances principally cover city or county service contractors. Nine cover only some form of economic development subsidy. Twenty-four cover both service contracts and economic development subsidies. Seven ordinances additionally cover some firms leasing land from the city, and one ordinance, Berkeley, California, extends coverage to all businesses within the Berkeley Marina Zone. Several also cover direct city or county employees in addition to contracts and/or subsidies recipients.

One ordinance, Santa Monica, requires employers who have no direct financial relationship with the city to pay a living wage (employers operating within the city's Coastal Zone tourist district with revenues of more than $5 million a year). Another ordinance, adopted in New Orleans by referendum, extends more broadly in covering all public and private sector workers, and thus resembles the more familiar minimum wage. Twenty ordinances cover some nonprofits.

Eleven ordinances include some "jobs" language—for example, job creation goals and targeted commu-

nity hiring. Two require covered firms to work with community hiring halls to fill jobs created with contract/subsidy.

Fifty-two ordinances require (or encourage) some form of health benefits. This sometimes implies only that the health benefit requirement is simply stated as such but can also require a wage at a higher percentage of the poverty calculation for firms that do not provide health benefits. Eight include vacation benefits.

Many ordinances include specific labor language having to do with prevailing wage, participation in union apprenticeship programs, prohibitions on use of public money for anti-union activities, worker retention, sick pay, vacation pay, and healthcare.

In addition to these governmental ordinances, ten universities have at least partly changed their wage or employment practices in response to living wage campaigns. Over twenty campus campaigns are either in early (five) or advanced (sixteen) stages of organizing. Students have led these efforts, but faculty, alumni, community members, and—in nine out of ten victories—local unions have played important roles. Among those with the strongest gains, such as Cornell, Wesleyan, Harvard, and Stanford, the new policies greatly reflect governmental ordinances in terms of the definitions of a living wage and the level of benefits. At many of the others, the gains have been much more modest.

Campaigns targeting governmental bodies and those targeting universities exhibit recurrent differences, but it is important to recognize the rising tide of campaigns against institutions of higher education.

Where and How?

During the 1960s, campaigns for government ordinances expanded in major urban areas throughout the United States. Key municipalities include Baltimore, Milwaukee, Chicago, Los Angeles, Boston, San Jose, Miami, Oakland, and New Orleans.

Baltimore

The living wage campaign in Baltimore was initiated by the preexisting Baltimoreans United in Leadership Development (BUILD) organization of forty-six churches, affiliated with the Industrial Areas Foundation. BUILD advanced the idea as part of an ongoing effort to rebuild the center city and provide economic justice to marginalized populations. The specific catalyst to a coalition around community development and workplace organizing was the Inner Harbor Development. This large-scale urban project required public subsidy, which in turn depended on support—or, at least, the absence of protest and resistance—from the city's predominantly black population. BUILD created a campaign with highly visible and original public actions (subsidy tours, etc.). An alliance was formed between BUILD and the international American Federation of State, County, and Municipal Employees (AFSCME), the largest union representing government employees. AFSCME viewed the living wage as a way to stem privatization.

The first step was to encourage the mayor to pass a "right to organize" ordinance, which he helped to do in the summer of 1994. The legislation protects the worker by voiding the contract of a contractor who fires someone for organizing and by hiring the fired person onto the city payroll. The immediate result of this law and the alliance was an intensive joint organizing campaign, especially among building service workers such as janitors, which created an organization of low-wage workers, Solidarity, which is self-described as "a little bit of church, a little bit of union, a little bit of social service, a whole lot of politics!"

The next step was a campaign for a living wage pegged to the inflation rate and applicable to city contractors. The campaign exploited existing political divisions and upcoming elections to garner support and fight the business opposition. In December 1994, the living wage ordinance passed with strong city council support.

Milwaukee

The living wage campaign in Milwaukee was led by the Campaign for a Sustainable Milwaukee (CSM), created in 1993 by the Milwaukee County Labor Council (MCLC). The CSM represented a broadly based coalition composed of housing activists, environmentalists, community organizers, religious leaders, and third-party activists, but clearly with the MCLC taking the leading role. The broad-based coalition contrasted to prior labor strategies where MCLC picked its battles selectively and only then sought out allies.

The CSM launched its campaign for a living wage in March 1995, using Baltimore's 1994 ordinance as its model. CSM targeted firms doing business with the city, the county, and the school board to pay a minimum $7.70 an hour. The campaign itself relied on grassroots organizing strategies that led to a string of partial successes in which all three units of government adopted a living wage ordinance. First, the city set its minimum pay for service contract employees at

$6.05 (1995), followed by the school district (1996) setting its baseline wages at $7.70 and the county (1997) at $6.25, all indexed for increases.

Following these successes, the CSM kept the coalition intact, establishing a Workers Rights Board (WRB) to protect workers rights, whether union or not. The WRB monitors and holds hearings on injustices workers face on the job and in their communities, and it monitors the three separate living wage ordinances.

Chicago

ACORN initiated the Chicago campaign by creating a steering committee composed of a wide variety of key organizations, including many unions. The coalition targeted city contracts and financial assistance. A systematic strategy to contact all fifty members of the city council in the fall of 1995 succeeded in bringing thirteen city council members on board in a short time, and by spring of 1996 twenty-six councilors had become cosponsors of the bill. The coalition organized rallies and used substantial political leverage to dissuade Mayor Richard Daley from opposing the law, which he did all the same. The coalition nonetheless continued its high-profile efforts promoting the living wage law. For example, it extended its range, supporting the attempts of a local company that paid living wages to stay in Chicago.

In the summer of 1997, activists finally pushed for a vote; Daley's opposition held sway and the vote failed. The campaign did not die, however. In the summer of 1998 living wage advocates linked the living wage issue with proposed increases in city council and mayoral salaries, and the mayor struck a deal allowing a living wage law covering city contracts to pass the city council.

Los Angeles

The LA campaign was initiated by local labor working in conjunction with community and religious groups on worker and economic issues. One aspect spurring the effort was the potential loss of hundreds of union jobs at the airport. The Los Angeles Alliance for a New Economy (LAANE)—created by a local of Hotel and Restaurant Employees (HERE) to promote a positive climate for low-wage organizing in the LA tourist sector—led the campaign.

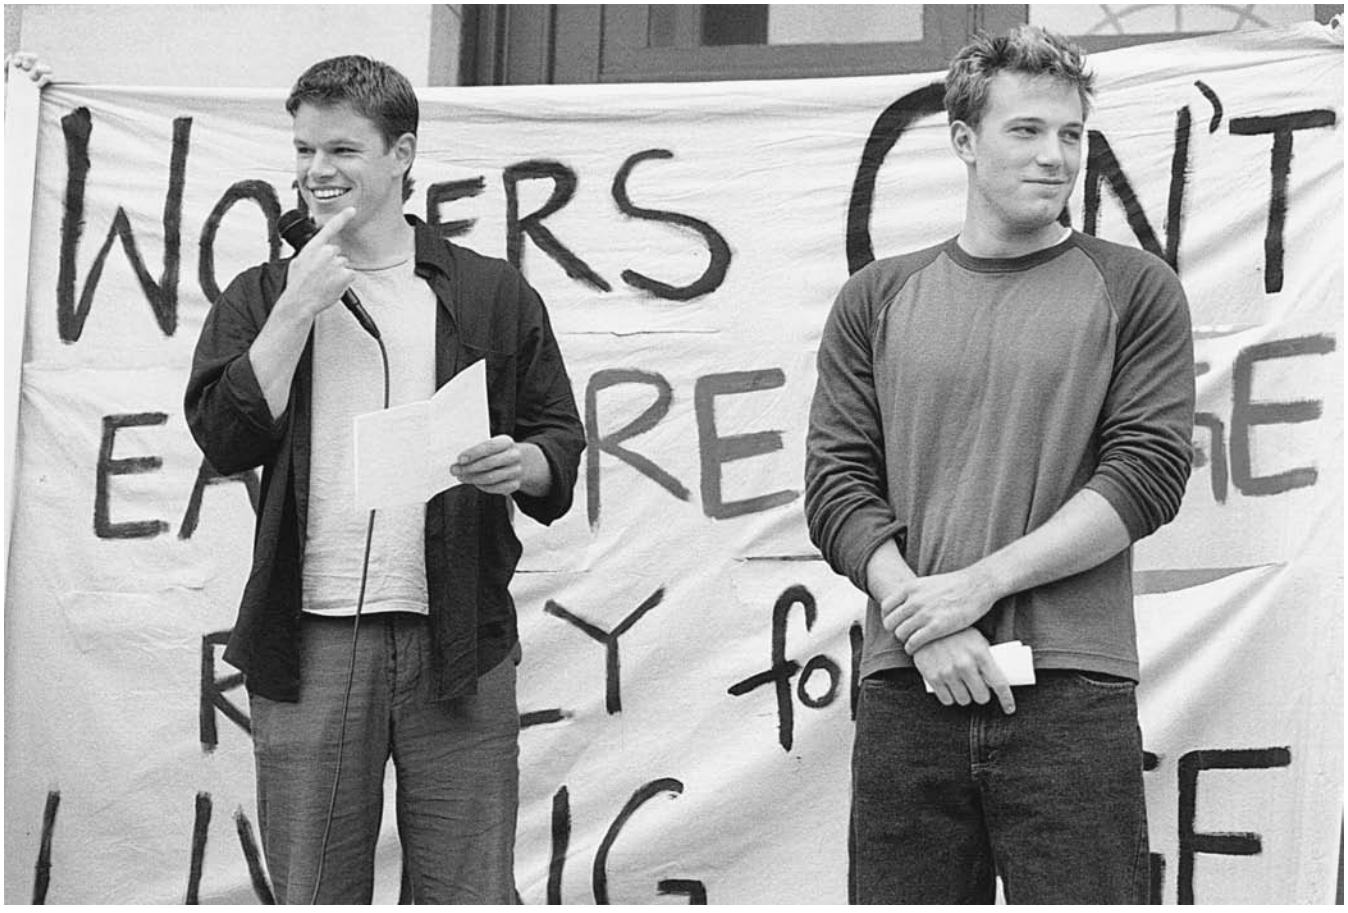
LAANE helped found an organization of progressive religious leaders with a focus on economic issues, recruited neighborhood, community, and union leaders, and organized and involved workers who would be affected by the ordinance. The effort faced concerted business opposition and a hostile mayor. The two-year multilevel campaign spent $300,000 and required policy development, coalition building, and worker education and mobilization. It created a presence in the streets and at city council meetings. It relied on well-prepared research, patient media strategy, and inside leadership of a progressive city council member. In the spring of 1997, the city council passed the measure unanimously and overrode the mayor's subsequent veto.

Boston

The Boston living wage campaign grew out of ACORN's efforts to create a labor-community coalition. Politicians warmly received early efforts, but this support evaporated when the mayor came out tentatively against the living wage idea. This stimulated more active organizing by the campaign. Escalating public action created strong support from the council and overrode a potential veto. By waiting until it had sufficient support for passage before releasing the actual provisions of the proposal, the campaign was able to outmaneuver the chamber of commerce and other opponents and pass legislation in 1997. The next year, the chamber counterattacked after the vote on legal grounds; the coalition yielded some elements in order to maintain the legislation.

San Jose

Working Partnerships USA (WPUSA), an organization created by the local South Bay Labor Council to "close the low road" while developing a high road and long-term strategy for restructuring low-wage industries to support families, led the living wage campaign. WPUSA's living wage campaign integrated research, policy development, grassroots education, and leadership. Together with San Jose State University, it created a local Labor Community Leadership Institute to educate leaders about the politics of local economic development. The campaign also recruited leaders from the WPUSA's preexisting Community Economic Blueprint Project. Participants in the resulting coalition included the Green Party, ACORN, a toxics coalition, an immigrant rights organization, Hispanic and Vietnamese Chambers of Commerce, and others. Against a business coalition and strong editorializing by the *San Jose Mercury News*, the campaign won support from key city council members and the mayor and passed the ordinance in 1998.



On May 6, 2000, actors Matt Damon (left) and Ben Affleck address a rally of the Harvard Living Wage Campaign with the aim of raising service workers' wages to $10.25 an hour. Damon had attended Harvard University and Affleck's father and stepmother had worked at Harvard as custodians. *(AP Wide World Photos)*

Miami/Dade County

The Miami case is relatively unique in that no vocal business opposition emerged. No one even spoke against it at the County Commissioner meeting at which the formal vote was held. But advocates anticipated such opposition and attempted a grassroots campaign. The Community Coalition for a Living Wage was initiated by the South Florida AFL-CIO and the Human Services Coalition, an organization of service providers to the poor. Following background research, the coalition held a series of low-key events: breakfasts, open meetings, opinion pieces, and the like. The coalition conducted a campaign that seems amateurish in comparison with other locales. There were no paid staff and little strategic discussion, and regular meetings drew limited attendance. The campaign suffered from sporadic leadership, no budget or treasury, uneven and halting outreach, and very little union involvement until near the end. Mass phone calling, one large public rally, and turnout for the vote constituted the main efforts. In May 1999, with hundreds of supporters watching, the county council voted unanimously in favor of the ordinance.

Oakland

Local unions and community organizations in Oakland created a new social movement organization after their joint efforts won the passage of a living wage ordinance. ACORN initiated the project, involving unions, other community organizations, and churches, but it also acted independently to highlight the plight of low-wage workers. In response to public actions, city officials began to promote the living wage idea. In fact, political support moved too fast for local organizers, who hadn't solidified coalition or policy, and they asked politicians to slow down the process. The

local campaign used models and resources from other cities' struggles (Denver and Los Angeles). In the course of the campaign, tension arose between labor and community leaders over leadership and specific policy issues, including first rights to jobs (between ACORN and unions). ACORN used the campaign as a recruitment strategy, while unions saw new points of leverage over firms in the legislation. However, members realized they needed each other, and the coalition held.

After the law was passed by the city council, coalition members moved to formalize their partnership. Subsequently, the HERE local contributed resources for creating the East Bay Alliance for Sustainable Economy (EBASE), an organization similar to Los Angeles–based LAANE. One of its functions is to monitor living wage enforcement. But the efforts did not end here. EBASE began organizing an extension of the living wage policy to the Port of Oakland. It created the Coalition for an Accountable Port, with an agenda driven by unions, ACORN, and local community groups in close proximity. In their report on this case, Zabin and Martin claim that the relationships developed in the first campaign supported the later alliance, and it was particularly crucial in that racial difference between the mostly white unions and the mostly black community neighboring the port could have led to a breakdown.

The EBASE coalition led the campaign for passage of Measure I in 2002, which would apply the living wage to the Port of Oakland, that city's primary employer. Labor unions, community organizations, and churches developed a corps of volunteers, who staffed phone banks, walked the precincts, and "postered" the city streets. This effort led to a victory in March 2002 when Oakland voters overwhelmingly, by 78 to 22 percent, approved the living wage initiative, which provides an inflation indexed wage rate of $10.50 without benefits and $9.37 with benefits to the 1,500 low-wage workers at the port proper. It also requires businesses designated as "port-assisted" to pay these same wage rates, and it guarantees, when a contract at the port changes hands, that existing workers will be retained for ninety days and can be fired only for just cause.

New Orleans

The New Orleans Campaign for a living wage (NOCLW) is a coalition of labor, community, and religious groups that began organizing its campaign with an alternative target. Instead of targeting firms holding contracts with the city, NOCLW drafted a living wage proposal that would cover all workers, except those specifically excluded, and mandate a citywide minimum wage of $6.15 an hour, indexed to federal inflation figures. Thus, the New Orleans wage rate is the lowest among adopting cities, but its coverage is much broader than the others. Nearly one-third of employees in New Orleans (about 75,000 people) would receive increases of roughly $500 to $2,000 per year. NOCLW also chose not to place the wage proposal before a reluctant city council and mayor. Instead, with ACORN in the lead, it circulated petitions gathering 25,000 signatures calling for a public referendum.

NOCLW made specific appeals to small business owners for support, arguing that the increased purchasing power of low-wage workers who lived in neighborhoods where small businesses are concentrated would enhance their business activities. More generally, the campaign relied upon a bottom-up, grassroots strategy. Opposition to the minimum wage centered on the organization Small Business Coalition to Save Jobs (SBCST), which was composed of the chamber of commerce, the Marriott, Hyatt, and Hilton hotel chains, and the Restaurant Association. Opponents first turned to the Louisiana State legislature, which in 1997 passed a law barring local jurisdictions from setting their own wage floors. Litigation against the living wage referendum was dismissed as moot by an appeals court because the referendum had not yet occurred. In February 2002, voters in New Orleans approved the living wage referendum by 63 to 37 percent. The nation's first minimum wage rate within a city had been enacted. Litigation over its constitutionality is expected in the future.

The Effects of Living Wage Campaigns and Ordinances

Most studies on living wage laws have addressed the economic effects of the proposed or enacted legislation, and a few consider the nature of the local coalitions and campaigns. We review these in turn and generate a beginning consideration of the factors associated with the success of living wage campaigns. We end with summary comments reflecting on the available data.

Robert Pollin and Stephanie Luce suggest that the small size of municipal polities inhibits money-dominated politics and facilitates the impact of advocacy coalitions. They also argue that urban poverty and limited low-wage employment, especially in the face of extensive public subsidies for development,

create opportunity. Other scholars use urban political theory to identify the types of cities in which public subsidies are linked to redistributive measures. Fiscal and economic variables, as well as "residential need," are key factors in this perspective.

Isaac Martin doubts that the key factors explaining the adoption of living wage laws are endogenous to cities. Discounting poverty levels and similar economic factors, he argues that political resources available to local labor and community organizations matter, in interaction with national networks that provide policy models and expertise from other cities. Using a logistical regression analysis of the factors affecting whether the cities with populations of 100,000 or more have enacted living wage laws, Martin finds that economic factors are not significant and that the interaction between the existence of an ACORN chapter and union density has a positive and significant effect. His analysis suffers from at least two evident weaknesses. First, the presence of an ACORN chapter is highly correlated with city size, which is also a positive and significant factor. Thus, the effect of the ACORN variable may be spurious. Second, Martin suggests that the operative dynamic in living wage law adoption reflects the isomorphic processes described by sociological new institutionalist theory, in which actors look to other actors for policy models in times of uncertainty and without knowing the full effects of policy options. This interpretation, although plausible, is not supported by any empirical evidence.

There are yet more problems with the ACORN chapter hypothesis. According to ACORN's Web site, although there are chapters in "more than 30 cities," ACORN-led coalitions have won living wage ordinances only in "St. Louis, St. Paul, Minneapolis, Boston, Oakland, Denver, Chicago, Cook County, IL and Detroit." These nine successes affiliated with ACORN chapters do not constitute compelling support for casting them as the key medium of diffusion and success for what is now over eighty living wage successes.

Other scholars focusing on social movements and presenting analyses of individual cases note several patterns with regard to successful campaigns. Nearly all living wage successes involve coalitions that include a broad range of members drawing from labor, community, and religious groups. David Reynolds suggests that the 1997 Chicago coalition is typical of many coalitions. It had seventy-eight members, including neighborhood organizations, state congressional representatives, a variety of unions, a New Party chapter, a homeless advocacy group, policy centers, the League of Women Voters, religious groups, ACORN, the Democratic Socialists of America, and others.

In many cases, central labor councils have been the key labor player. The community groups that have been critical in initiating many campaigns are often local chapters of the ACORN and Industrial Area Foundations. In a number of cities, organizations of religious leaders concerned about local economic issues either initiated the living wage campaign or were formed in the early stages of campaign building.

The passage of living wage laws may reflect a diffusion process whereby a local or regional success legitimates the concept for nearby actors, unions, community organizations, and public officials alike. The geographic cluster of living wage ordinances suggests a process of inspiration or imitation vis-à-vis nearby cities. For example, California (fifteen), Michigan (nine), Wisconsin (six), and New York (six) account for thirty-six successes—almost half of the total. While California may be at greater "risk" for the passage of living wage laws due to the number of California cities and municipalities, the other three states combined with Wisconsin (four) account for one-third of the total, not including three cases in New Jersey. It may be possible to model the diffusion of living wage laws from regional origins, particularly major metropolitan cities. Many of the living wage cities or counties are not large urban areas, and within a framework of imitative diffusion, are likely to take leads from these regional hubs.

Conclusion

The living wage movement has had multiple impacts which as yet are not fully understood. However, it is clearly a movement as judged by the number of coalitions that exist, and it has achieved some notable success. The movement has modified a range of wage-setting practices, and it is potentially reshaping a number of related labor processes. In addition to the direct effects on workers and their families, the living wage campaigns have also raised important questions about economic and political practices. Attempts to understand the economic consequences of these laws have stimulated creative rethinking of theoretical and applied issues heatedly disputed regarding minimum wage policies. In the political sphere, new coalitions, issue framings, and public policies may combine to unsettle existing relationships and offer opportunities for creative policy entrepreneurs to exploit.

Another important effect may be increased cooperation and collaboration between unions and various types of community organizations. Generated in con-

crete local struggles, the widely shared experiences of positive union-community relationships and most important, of victories, may diffuse through these respective networks and facilitate future coalitions beyond the original contexts. By building trust, raising beliefs in joint efficacy, and suggesting new cooperative possibilities, living wage campaigns may lower future costs and heighten the gains from innovative coalitions and partnerships. The living wage campaigns demonstrate that coalitions of diverse actors and organizations, though always difficult to build and fragile over time, are possible. The campaigns also illuminate the importance of such coalitions for both winning passage of ordinances and ensuring their implementation. The major significance of the living wage movement may in fact lie in the construction of coalitions committed to reducing poverty and new strategies for improving the lives of low-wage workers.

Protests Against the World Trade Organization in Seattle

On November 30, 1999, the "Battle of Seattle" began. Protesters delayed and seriously disrupted the ministerial meetings of the World Trade Organization (WTO). Police and law enforcement officers, wearing riot gear and carrying billy clubs, pepper spray, and tear gas canisters, responded by chasing the crowds around the city streets, using the gas and clubs they carried, and arresting more than 500 people, including some engaged in nonviolent civil disobedience and some simply caught in the action. The mayoral proclamation of a "no-protest zone" in the downtown core and the abrogation of the civil rights of the detainees provoked further demonstrations. The "Battle of Seattle" may have officially ended on December 3, but it became the precursor for major demonstrations for global justice that followed in Mexico City, Prague, Melbourne, Washington, D.C., Genoa, New York, and other cities throughout the world where representatives of world financial institutions were meeting.

The WTO was virtually invisible to most of the United States population before the protests, but by the end of this well-publicized week, the WTO and its opposition were major subjects of controversy and debate. The trade ministers had come to Seattle to define the rules of international trade. More than 40,000 demonstrators wanted a more radical reconsideration of the economics and politics of international trade and financial organizations. The protesters came from a myriad of social movements, and they pushed a diverse agenda, including but not limited to environmental, human rights, fair trade, Third World development, biotechnology, debt relief, labor, and agriculture issues. Some were interested only in nonconfrontational and legal demonstrations, others were committed to nonviolent civil disobedience, and a small minority brandished vandalism as a tactic. Coalitions among the protest organizations formed, dissolved, and re-formed during the months of planning preceding the ministerial meetings and during the week of action.

The protesters were united in their opposition to corporate globalization that serves big multinationals and rich nations to the detriment of workers, peasants, poor countries, and the environment. Months of popular mobilization and years of campaign work by movement organizations paid off in the streets of Seattle. A new mass movement for global justice was born.

The World Trade Organization

The World Trade Organization is the international organization charged with providing an institutional framework for the conduct of trade negotiations among its membership of over 140 nations. Founded in 1995 as an extension of the General Agreement on Tariffs and Trade (GATT), the WTO has greatly expanded influence over multilateral trade. Whereas GATT had no enforcement powers, the WTO has the authority to enforce trade agreements among its members, even when WTO policies conflict with domestic laws.

The primary goals of the WTO are to help trade flow freely by providing a set of rules to which all member nations must abide, to provide a forum for trade negotiation, and to settle trade disputes among its members. All member nations must adhere to a series of agreements covering trade spheres such as agriculture, intellectual property, and services. All trade relationships must be nondiscriminatory—that is, all trading partners must be treated equally, with no partner receiving special treatment. The policy further requires the increasing elimination of protectionism by a country of its products.

When one country challenges another's trade policy, a panel of three trade representatives hears the disputes. A country that refuses to abide by the panel's decision may face WTO-approved trade sanctions. Trade ministers represent their countries to the

On November 30, 1999, protesters mount a city bus that police had parked end-to-end around the Seattle Convention Center to keep them out. *(Liz A. Highleyman)*

WTO and meet periodically to work out details of trade agreements. Negotiations are named for the location in which they meet. During the "Seattle Round," ministers planned to address agriculture, services, and government procurement (left over from the previous "Uruguay Round"). On the table in Seattle were the Forest Products Agreement, the Multilateral Agreement on Investments (banking and finance), biotechnology, intellectual property rights, and electronic commerce. Labor rights, human rights, and the social and environmental consequences of trade policy were most definitely not on the table.

Objections to the WTO

Detractors accuse the WTO of being undemocratic, serving the interests of corporations over people and the environment, trampling human rights, increasing global inequality, and undermining national sovereignty. They view the WTO as serving the interests of corporations and rich nations to the detriment of the interests of less-developed nations, who are forced into trade agreements that are not necessarily beneficial to them. A primary complaint is that the WTO lacks transparency; negotiations often take place in closed sessions, and there is no public record of the proceedings.

To illustrate some of these claims, activists publicized the Hormone Beef and the Shrimp-Turtle cases. In both cases, the WTO's dispute resolution board ruled against countries that had adopted regulations to protect the environment or public health.

In the Hormone Beef case, the United States challenged a European Union (EU) ban on the sale of beef from cattle that had been fed certain artificial growth hormones because this disqualified some American beef from sale. The law was intended to protect consumers from the unknown effects of hormones, but the WTO ruled that this public health measure was an illegal barrier to trade under the WTO and gave the EU a limited period to open its markets to hormone-treated beef.

In the same year, several Asian nations brought the United States before the WTO. The U.S. Endangered Species Act forbade the sale of shrimp that had been caught in nets that did not use inexpensive "turtle excluder devices" to eliminate the trapping and killing of endangered sea turtles in the nets. The WTO ruled against the United States, which then sought ways to rewrite its laws to bring them into compliance with the WTO while still protecting turtles.

Organized labor has battled long and hard to protect the rights of workers, and a victory on a global scale occurred in 1998 when the International Labour Organization (ILO) adopted the Declaration on Fundamental Principles and Rights at Work. Through this action, the ILO confirmed the core labor standards it had sought to uphold since its founding in 1919. These include the right of association, the right to organize and bargain collectively, prohibition against the use of any form of forced or compulsory labor, a minimum age for the employment of children, and acceptable work conditions with respect to minimum wages, hours of work, and occupational safety and health. The ILO has nearly 350 country members and considerable research capacity, but no enforcement powers. Thus, labor organizations are searching elsewhere for an international body capable of effective implementation.

ILO DECLARATION ON FUNDAMENTAL PRINCIPLES AND RIGHTS AT WORK 1998

The International Labour Organization (ILO), founded in 1919 under the Treaty of Versailles, is the United Nations agency that seeks to promote social justice and internationally recognized human and labor rights. In 1998, the Declaration on Fundamental Principles and Rights at Work addressed the declining labor standards worldwide and the need to provide basic rights in the workplace.

International Labour Conference 86th Session, Geneva, June 1998

Whereas the ILO was founded in the conviction that social justice is essential to universal and lasting peace;

Whereas economic growth is essential but not sufficient to ensure equity, social progress and the eradication of poverty. . . .

Whereas the ILO should . . . draw upon all its standard-setting, technical cooperation and research resources in all its areas of competence, in particular employment, vocational training and working conditions, to ensure that, in the context of a global strategy for economic and social development, economic and social policies are mutually reinforcing components in order to create broad-based sustainable development;

Whereas the ILO should give special attention to the problems of persons with special social needs, particularly the unemployed and migrant workers, and mobilize and encourage international, regional and national efforts aimed at resolving their problems, and promote effective policies aimed at job creation;

Whereas, in seeking to maintain the link between social progress and economic growth, the guarantee of fundamental principles and rights at work is of particular significance in that it enables the persons concerned to claim freely and on the basis of equality of opportunity their fair share of the wealth which they have helped to generate, and to achieve fully their human potential;

Whereas the ILO is the constitutionally mandated international organization and the competent body to set and deal with international labour standards. . . .

Whereas it is urgent, in a situation of growing economic interdependence, to reaffirm the immutable nature of the fundamental principles and rights embodied in the Constitution of the Organization and to promote their universal application;

The International Labour Conference

1. Recalls:

(a) that in freely joining the ILO, all Members have endorsed the principles and rights set out in its Constitution and in the Declaration of Philadelphia, and have undertaken to work towards attaining the overall objectives of the Organization to the best of their resources. . . .

(b) that these principles and rights have been expressed and developed in the form of specific rights and obligations in Conventions recognized as fundamental both inside and outside the Organization.

2. Declares that all Members, even if they have not ratified the Conventions in question, have an obligation arising from the very fact of membership in the Organization, to respect, to promote and to realize . . . the principles concerning the fundamental rights, . . . namely:

(a) freedom of association and the effective recognition of the right to collective bargaining;

(b) the elimination of all forms of forced or compulsory labour;

(c) the effective abolition of child labour; and

(d) the elimination of discrimination in respect of employment and occupation.

3. Recognizes the obligation on the Organization to assist its Members, . . . in order to attain these objectives by making full use of its constitutional, operational and budgetary resources, including by the mobilization of external resources and support, as well as by encouraging other international organizations . . . to support these efforts:

(a) by offering technical cooperation and advisory services to promote the ratification and implementation of the fundamental Conventions;

(b) by assisting those Members not yet in a position to ratify some or all of these Conventions in their efforts to respect, to promote and to realize the principles concerning fundamental rights . . . and

(c) by helping the Members in their efforts to create a climate for economic and social development.

4. Decides that, to give full effect to this Declaration, a promotional follow-up, . . . shall be implemented in accordance with the measures specified in the annex hereto. . . .

5. Stresses that labour standards should not be used for protectionist trade purposes, and that nothing in this Declaration and its follow-up shall be invoked or otherwise used for such purposes; in addition, the comparative advantage of any country should in no way be called into question by this Declaration and its follow-up.

Police fire tear gas to disperse protesters in Seattle during the conference of the World Trade Organization on November 30, 1999. *(AP Wide World Photos)*

The AFL-CIO advocates that the WTO officially adopt the core labor standards and establish enforcement mechanisms to penalize trade of products derived from substandard production practices. The WTO is uniquely situated to impose labor standards because it has enforcement powers to which member countries have agreed to abide. Nor is there any question that many corporations derive greater profits and that wealthier nations obtain cheaper goods off the backs of those who work in sweatshops for paltry wages, often in unsafe working conditions and without the benefit of union protection. For global justice activists, this is unfair trade and should be deemed so by the adjudicating trade body, the WTO.

Although all WTO members in 1996 vowed to observe core labor standards, the WTO has no official procedures to uphold them. Moreover, some of the poorer countries, for whom low-wage workers are a prime asset, resist linkage of trade sanctions and labor rights. Poor countries are also increasingly in debt to other multilateral institutions like the International Monetary Fund, paying significant portions of their GNP to debt service instead of providing for their citizens. When the majority of a country's workers receive sweatshop wages, the country has no possibility of escaping the yoke of debt. Even so, interests both within and outside of their countries benefit and resist regulation.

Activists accuse the WTO of being undemocratic. First, power within the WTO is extremely unequal, advantaging the rich countries (especially the "Quad"—United States, Canada, Japan, and the European Union) and disadvantaging the poor. The process for reaching important agreements is often through side deals, not one country, one vote. In late 1999, for example, eleven developing countries sent a letter to the chairman of the WTO complaining that they had been excluded from small "green room" meetings in which trade ministers planned the agenda for Seattle. These countries continue to agitate, thus confirming the global justice activists' perception about undemocratic processes within the WTO.

Second, the WTO arbitration panel can overrule domestic laws and in other ways undermine national

sovereignty and even the political will of populaces who have democratically determined to protect themselves against hormone additives or to shelter turtles from shrimp nets. There is no mechanism for making the WTO accountable; it is not an elected body, nor is it subject to checks and balances outside itself. This is, of course, a general problem with international trade and financial institutions, but some are more open to mechanisms of external accountability than others.

Major Actors in the Protests

People for Fair Trade/Network Opposed to the WTO (PFT/NOWTO) was a spinoff from the consumer rights organization Public Citizen, formed to coordinate the mobilization of activists to join the protest in Seattle. PFT set itself up as a resource for Seattle activists, running a speakers' bureau, holding large public meetings, doing outreach to student groups and local activists, and providing coordination for diverse groups with diverse issues. Mike Dolan, a veteran of many national campaigns and the deputy director of the Global Trade Watch program of Public Citizen, headed PFT. PFT used the Alinsky model (named after Saul Alinsky, a community organizer in the 1950s and 1960s) of educating to organize, not organizing to educate. The focus of much of the PFT effort was turnout for the November 30 march and rally, initiated by the AFL-CIO.

Although PFT played an important role in coordinating the mobilization that preceded the protests against the WTO, the organization itself demonstrates the difficulties in coordinating a coalition of diverse interests. PFT began its life as a coalition of about eighty people and organizations who attended a public meeting called by Dolan soon after the WTO announced Seattle would be the location of its ministerial meeting. Some meeting attendees, including representatives of labor, environment, trade, faith-based, and other organizations, had worked together on previous campaigns such as the anti-Multilateral Agreement on Investments (MAI) campaign, the Stop Fast Track Trade Negotiating Authority campaign, and the anti-North American Free Trade Agreement (NAFTA) campaign, while others found out about the meeting through alternative networks. They formed a steering committee and ad hoc working groups to plan and coordinate the protest logistics. For the next several months, however, their activities apparently centered on a debate over the name their organization would adopt. "People for Fair Trade" appealed to some, typically the more mainstream activists who advocated reforming the WTO, while more radical activists who wanted to abolish the WTO preferred "Network Opposed to the WTO." The group never reached consensus and decided to string both names together. Later, when the coalition collapsed and PFT became a staff-run venture headed by Dolan, groups that wanted to continue an affiliation would adopt whichever name they preferred, resulting in PFT neighborhood groups and NOWTO student groups at local colleges and universities. The early failure to agree on a name essentially doomed the coalition, which withered away.

During the summer, Mike Dolan set up an office in downtown Seattle and hired a small professional staff, adopting the PFT/NOWTO name. There was some tension between PFT and several local activists who would have preferred a volunteer-based nonhierarchical steering committee to the staff-driven hierarchical organization the PFT became. Whereas PFT was focused on coordinating a single event, the labor march on November 30, many local groups wanted to use the event for movement building.

The AFL-CIO turned out the largest block of people in Seattle for the march on November 30. Taking advantage of its federated structure and dispersing responsibility for mobilization among West Coast locals, the AFL-CIO turned out between 20,000 and 40,000 people.

The King County Labor Council (KCLC) and its executive secretary, Ron Judd, began to deal with logistics and coordination the very day the WTO announced Seattle as the location of its upcoming ministerial meeting. The AFL's participation in the protests was not a given—its relationship to trade is complex. Torn between supporting favored pro–free trade Democratic politicians and watching high-paying union jobs shift to the less expensive Third World, the AFL-CIO decided that Seattle was a place to take a stand. It adopted an "inside-outside" strategy of protest—advocating "fair" trade and adoption of the ILO's core labor standards within the WTO, as well as organizing a massive march through downtown Seattle on November 30.

In the autumn, the AFL employed about thirty organizers to conduct informational briefings within the locals and to encourage their participation. The AFL rented trains and busses for union members and their families to travel to Seattle and made attendance an institutional priority.

The AFL was careful during the mobilization phase to downplay the direct action and mass civil disobedience being planned by other groups in order to secure the greatest cooperation of its members who

might have been turned off by direct action. The march was advertised as a family event, and union members were encouraged to bring their families, which many appear to have done. Less mobile union sympathizers were able to attend parallel events to the march.

The focus of the AFL campaign involved educating its members and getting them to the march. There was little public knowledge about the WTO in mid-1999 and much less about its implications for labor, but some unions such as the Steelworkers, Union of Needletrades, Industrial, and Textile Employees (UNITE), Teamsters, and United Auto Workers who had been seriously affected by trade policies were already very well informed and consequently more prepared to take a radical stance against the WTO. Early in the mobilization, there had been some talk of a general strike, and Judd was credited with calling for one, but a general strike was never an AFL goal.

Some within labor's ranks felt that the AFL-CIO had not gone nearly far enough in its opposition to the WTO. Some unions, for example, the IWW, the Steelworkers, and some Teamster locals, were determined to be more militant in their opposition, and they planned to join the civil disobedience in the downtown core as the march passed through. Confusion downtown led to conflicts over the route of the march. Given the decision to maintain a legal and peaceful march, labor marshals tried to steer the march on an alternate route away from the ongoing street battles. Thousands broke through—some by choice and some by chance—and added their number to the face-off against the police. As the afternoon grew more heated, most unionists departed and rejoined the march back to Memorial Stadium.

As the week wore on, and the official response to the protests was to deny the populace their civil liberties, organized labor and especially the King County Labor Council (KCLC), led by Ron Judd, Verlene Wilder, and others, played a major role as liaison with city officials, urging temperance in the city's response. Although organized labor had actively tried to distance itself from groups that promoted nonviolent civil disobedience during the preparation and early mobilization phase, the Labor Temple became a sanctuary for activists being pursued by riot police later in the week and Ron Judd became a very vocal defender of civil liberties. When about 600 nonviolent protesters were sent to jail on December 1, the day after the massive protests, Judd was instrumental in securing their release, cashing in some of his political chits with the city. He also provided the resources of the KCLC to coordinate a second major march on Friday, December 2. Local unions supplied food to those holding a vigil at the downtown jail awaiting the release of arrested activists. By the end of the week, organized labor and other protesters had drawn closer together.

The primary role of the Direct Action Network (DAN) in the protests was training activists in a variety of nonviolent civil disobedience tactics such as jail solidarity, street theater, drumming, chanting, signmaking, first aid, as well as the philosophy of nonviolence itself. Activists were recruited to Seattle through vast informal networks; as a result, many who came to Seattle were veterans of protest movements.

DAN adopted a decision-making structure designed to contradict the structure of the WTO. Where the WTO was dominated by a few wealthy nations and developing nations were deprived of influence, DAN adopted a horizontal structure in which decisions were made through a formal consensus process. Activists were arranged into clusters of affinity groups that together planned their protest activities. They ensured their representation in organizational decision making by sending the spokespersons of affiliated groups to weekly "spokescouncil" meetings.

The roots of DAN lie in the efforts of Art and Revolution, a San Francisco–based group that works to develop creative protests with other social change organizations. In mid-1999 Art and Revolution sought partners in planning street theater and mass direct action in Seattle. By June, a number of West Coast activist groups were meeting in regular conference calls to plan the protests. Their plan was to form an organization modeled after organizations like Reclaim the Streets and Peoples' Global Action, which would initiate a single mass direct action in Seattle as a focal point for mobilization. Later, the plan changed to training and supporting activists in smaller independent actions.

The organizing group, which included Anarchists, environmentalists, activists from West Coast colleges and members of Jobs with Justice, received financial support from Global Exchange, Rainforest Action Network, and the Ruckus Society. The nascent network then formulated basic direct action guidelines before putting out a larger call to action. The agreement among these groups committed DAN to support activists with training and legal support and for all activists to agree to certain guidelines. Individuals who wanted to affiliate themselves with DAN must agree to four basic principles: to use no violence, either physical or verbal, toward any person, to not carry

weapons, neither to bring nor to use any alcohol or illegal drugs to the protest, and to not destroy property.

The organizing group planned to offer the organizational and strategic model it was building as a model for future mass actions, and DAN groups were eventually formed throughout the United States. In Seattle, DAN secured a large warehouse space close to downtown where activists could gather for meetings, where they could create props (puppets, banners, picket signs, costumes), and where they could eat and attend training and workshop sessions on a variety of topics ranging from "radical jeerleading" and drumming to emergency first aid. For several weeks the "convergence center" was a major hub of protest planning activity in Seattle.

As November 30 grew closer and DAN membership grew larger, relationships between DAN and the more mainstream organizers remained chilly. Even after a missed phone call resulted in the AFL-CIO-initiated march and the direct action being scheduled on the same day, DAN and the AFL had almost no contact. PFT was not overtly supportive of DAN either, removing links to DAN's website from its web page and not including DAN-sponsored events on the public calendar of events it published weekly in print and electronic form. Both the AFL and PFT took steps to isolate their supporters from DAN, putting the labor march and the direct action in competition with each other. Other groups, such as Jobs with Justice and the IWW, more marginal groups in the labor movement, were very supportive of and more tightly linked to DAN.

Hundreds of other organizations also participated in the protests. They represented an extremely diverse set of issues and concerns, ranging from political autonomy for Tibet to banning genetically engineered food, from protecting the environment to protecting workers. Some formed unlikely (and possibly short-term) coalitions, such as the Alliance for Sustainable Jobs and the Environment (ASJE), which developed among the U.S. Steelworkers and various environmental groups. And several signs boasted, "Teamsters and Turtles! Together at Last." All found a way to link their causes to the neoliberal trade regime represented by the WTO.

With a strong foundation in the religious community, Jubilee 2000 played a major role in organizing activities during the WTO ministerial meeting for "mainstream" activists. Jubilee 2000 focuses its activities on debt relief for Third World nations.

In the environmental community, the Sierra Club, EarthJustice, and American Lands Alliance were prominent. They worked with other organizations, especially AFL-CIO affiliates and the PFT, to organize scores of public events both before and during ministerial week. With Jubilee 2000, they helped legitimate the protests with the broader public.

Although they often had fewer resources to contribute and were often less visible as a result, local Seattle-based organizations were also both active and significant. Among many others, the Northwest Labor Employment Law Office (LELO) and the People's Assembly mobilized racial and ethnic minorities in Seattle, and student groups at area universities and community colleges were active on campuses.

An organization founded in anticipation of the Seattle protests was the Independent Media Center (Indy Media or IMC), a collective of independent (mostly amateur) journalists. IMC activists, unlike mainstream reporters, placed themselves in the center of the action throughout the week. They documented the protests on video and in print articles that were posted on the IMC website and beamed by satellite to public access television stations throughout the United States.

Legal observers trained by the National Lawyers Guild were highly visible during the protests and offered protesters a measure of protection as they stood in the middle of the action and recorded their observations.

Protest Narrative

The week of protests began on the cold and rainy night of November 29, 1999. Jubilee 2000 sponsored a symbolic circling of the Convention Center where the WTO was to meet the next day. The peaceful nighttime rally drew more than 3,000 participants from the environmental movement, churches, and labor unions.

Nongovernmental organizations (NGOs) had planned a week-long conference to parallel the WTO's meeting. Each day was designated to focus on a specific set of issues, such as Women and Health, Food and Agriculture, and Democracy, and issue-specific forums and lectures were held at the First United Methodist Church. In addition, other groups planned teach-ins, debates, workshops, and smaller protests and rallies. All of these activities were overshadowed in the media by the mass demonstrations downtown, but these educational events were ongoing throughout and were important in contributing to the construction of a broad-based movement for global justice.

On Tuesday, November 30, the diversity of opposition to the WTO revealed itself in the banners, slogans, and chants of the marchers who converged downtown. They came from all over the city: Seattle Central Community College, the University of Washington, Victor Steinbreuck Park near Pike Place Market, the Filipino Community Center, the Denny Playfield. They united in the central business district where police in riot gear awaited them. Some wore the famous turtle costumes, some carried large puppets, some dressed in the hippy garb of the 1960s protests, and others were simply in everyday clothes. The atmosphere initially resembled that of a festival or a celebration. Documenting their progress were independent journalists who carried badges from Indy Media and legal observers trained and organized by the National Lawyers' Guild.

While most protesters milled around downtown streets, some activists locked themselves to one another or to concrete blocks, tying up key intersections downtown. Others heckled WTO ministers and their staffs as they tried to make their way to the Paramount Theater for the WTO's opening ceremonies, linking arms and refusing the delegates passage. By mid-morning the streets were flooded with protesters, who effectively forced the WTO to cancel opening ceremonies.

The police, wildly outnumbered by the demonstrators, concentrated on the periphery of these activities. A small group of masked, black-clad Anarchists took advantage of the geography of the police and dashed through downtown breaking windows and spray-painting anarchy symbols and slogans against the WTO. Some protesters attempted to protect glass storefronts. It was on these images of broken windows that the mainstream media focused, presenting a skewed view of the protests to the public at-large.

Throughout the day, police attempted to clear the streets, firing tear gas and concussion grenades into the crowds. Activists resisted, some seating themselves in the street and locking their arms. Most had no more than wet bandanas to protect them from the tear gas and pepper spray police aimed directly at their faces. This standoff repeated itself again and again in the downtown core. By late afternoon, despite their lack of progress in removing protesters, police had run out of tear gas and pepper spray, prompting a police captain to fly to Wyoming to gather additional supplies. The city council's WTO Accountability Review Committee later reported that during the day "police were violently barraged with ball bearings ("pachinko" balls), rocks and bottles, squirted with urine, etc."

While the civilly disobedient activists gathered downtown, more than 30,000 (some say 40,000 or more) additional demonstrators gathered at Memorial Stadium at Seattle Center for the rally and march organized by the AFL-CIO, the PFT/NOWTO, and other groups. The AFL-CIO march left Seattle Center at midday, and approximately 25,000 people headed toward downtown. Although the march route was redrawn to avoid the clashes downtown, thousands of marchers nonetheless joined the protests, at least for a time.

At 4:30 in the afternoon, Seattle Mayor Paul Schell declared a state of emergency in Seattle and established a 7 P.M. to 7:30 A.M. curfew downtown. Conflicts between police and crowd continued deep into the night and well outside the downtown core. Some of those caught in the gas or even arrested were not protesters but bystanders or people simply caught by accident as they tried to go to or from their homes.

The next morning, Wednesday, the central business district (CBD) became a "no protest zone," enforced by the police. There is still debate about what the mayor said or required, but there is no question that downtown protesters were under attack from the police who attempted to keep them out of the CBD. The anger protesters felt at the abridgment of their civil liberties was further fueled by President Bill Clinton's speech to WTO ministers in which he recognized the legitimacy of the demands for global justice and the reasons for the intensity of protest. He called on the WTO representatives to listen to the concerns being expressed on the street and to respond to them with policies designed to increase prosperity for all.

The remainder of the week centered as much on freedom of speech and freedom from police violence—local justice—as much as on global justice. Outside the Convention Center, demonstrators were again on the streets, protesting both the WTO and the "no protest" zone. Steelworkers, returning from a rally against cheap imported steel, converged with protesters fleeing police who had doused the crowd with tear gas while chasing and arresting hundreds of the nonviolent protesters. Some sought refuge in the Labor Temple, interrupting a strategy meeting of labor leaders. Nearly 600 were arrested that day, December 1.

On Thursday, December 2, labor and community leaders met to plan a march for Friday. They had learned that detainees were being denied fair treatment in jail and that some had been physically assaulted. They called on students, religious leaders,

environmentalists, Seattle citizens, and DAN activists to turn out. Ron Judd confronted city officials who opposed the march route through downtown. The marchers intended to transform the "No Protest Zone" back into a "Free Protest Zone."

Meanwhile, those who had been arrested called on their training in jail solidarity; they coordinated and refused to give their names until some of their common demands were met. Most important, they demanded application of the same misdemeanor charges to all activists and the right to consult a lawyer. Outside the King County Jail, supporters held an around-the-clock vigil demanding their release. Labor leaders and others negotiated with city officials to prevent disruption of the vigil, and an additional rally at the jail was planned for Friday following the march to take back the city.

On Friday, December 2, about 2,000 activists and radicalized citizens joined the march organized primarily by labor movement leaders. As a result of Ron Judd's negotiations with the city, the marchers were unmolested. Calls for fair treatment for jailed protesters continued, and many were released. The religious community held an interfaith prayer gathering.

The week came to a close. By Saturday, the WTO had left town. The activists felt triumphant in their opposition to the WTO and their support for global justice. They felt they had also succeeded in winning some local justice by taking the city back and reclaiming their civil rights. In the months following, nearly all the cases against arrestees were dismissed, the police chief resigned, the police were lambasted for improper procedures, and the mayor failed to gain reelection or even renomination. Thousands of observers and participants declared themselves radicalized. The Battle of Seattle symbolized the inauguration of the mass movement for global justice.

What Was Accomplished?

The protests in Seattle and all the protests that followed have led to changes in the public rhetoric of many of the international financial institutions, most particularly the World Bank. Perhaps the leaders of these organizations have developed greater sensitivity to issues of global justice. Yet, the major effect on the WTO seems to have been on the scheduling of its next meeting. It took place in Doha, Qatar, a location to which protesters were unlikely to have access.

Seattle cleaned its streets, reopened its downtown businesses, and returned to life pretty much as normal. The Seattle General Strike of 1919 remains an important part of the city's history, and so will the 1999 Battle of Seattle. However, the dot-com bust and the departure of Boeing's international headquarters are likely to have as many long-lasting effects on city business and politics as these significant social movements.

The events of the week of November 30–December 3, 1999, did much to expose the seamy side of globalization to public scrutiny. The protests, the teach-ins, the rallies, and their preparation helped build a solid foundation for a movement for global justice. New organizations, especially the Direct Action Network and the Independent Media Center, provided institutional models that diffused around the globe. DAN enabled activists to learn why and how to advocate global justice; the IMC made it possible for web-fluent citizens to see alternatives to mainstream media portraits of events. Movement organizations worked closely with old and new partners to mobilize their constituencies and reach out to new ones. "Teamsters and Turtles" may be somewhat mythic, but real and possibly enduring coalitions did form. The protests against the WTO in Seattle provided a template for similar protests worldwide and established a broad base of grassroots support for global justice campaigns.

Anti-Sweatshop Movement

The sweatshop has been with us since the dawn of industrialization. From its spread in the late nineteenth century until the present, the sweatshop as an institution and place of production has become synonymous with the garment industry and the production of clothing. Reformers, government investigators (local, state, and federal), trade unionists, and consumers have fought against this scourge since the 1890s when it was "discovered"—that is, given widespread attention and publicity—with mixed success. Yet, for all these efforts, in the early 1990s the sweatshop resurfaced.

The movement against sweatshops is an outgrowth of the economics of sweatshops that dehumanizes workers and their families. In 1896, a United States Department of Labor report defined it as follows: "a condition under which a maximum amount of work in a given time is performed for a minimum wage, and in which ordinary rules of health and comfort are disregarded." Today we recognize sweating labor as conditions of work in which any aspect of labor, building, or health codes is violated.

Sweatshops developed in the garment industry for a number of reasons. Economists perceive sweatshops as primitive production—a phase that some industries go through on their way to more mature manufacturing. Economist Michael Piore suggests that the lack of capital investment needed for garment production supports sweating labor. In most industries, capital investment is large. Therefore, management has an incentive to produce as efficiently as possible and to control production. Cost-effectiveness is achieved through scales of efficient production. But garments today as always are produced with very little technology, and workers are paid per piece. If a manufacturing company needs more goods, it merely hires more workers. If workers produce less, they get paid less. All the costs are borne by the workers. Therefore, since the barrier to enter the industry is small, developing nations see garment production as their first entry into industrial production. In addition, the nature of garment production and the nature of fashion play a role. Garment production is tied to consumer demand and the whims of fashion. Retailers need goods quickly as well as cheaply. They rely on contractors to deliver the goods. These contractors often subcontract, creating layers between workers and retailers. There are now as many as six sessions of production, and retailers order fewer and fewer items because time is important. No one wants bathing suits on a shelf in September. Only in goods such as jeans, where the demand is strong regardless of season, is production continuous and conducted in large-scale factory settings where efficiency is important. To meet these demands, sweating is often used. The chaotic nature of the industry, the flexibility needed to service the whims of fashion, the ready supply of cheap immigrant labor willing to accept subpar working standards, the use of homework, and the ever-present contracting/subcontracting system all led to making the sweatshop central to garment production in the United States and beyond.

The sweatshop reform effort of the early twentieth century was part of the larger reform efforts of the Progressive Era. Reformers were interested in bettering the lives of ordinary workingmen and women. Efforts to improve living conditions, public health, and sanitation, as well as working conditions, were at the center of these efforts. The sweatshop naturally attracted the attention of reformers because it was in essence at the center of all these reform efforts: sweatshops were typically homework shops in tenements (public health and living conditions) and provided an example of the ugliness of industrialization (working conditions).

From its discovery in the late 1890s, the crusades against the sweatshop had three principal partners: workers and unions, middle-class reformers and con-

sumers, and government regulators. Embedded in these efforts has been the issue of morality, which is equated with other abolitionist movements in the United States. Sweatshops were seen as a moral failure, and to remove them was an act of civilizing the nation. In addition, since most sweatshop workers are women, the anti-sweatshop movement has traditionally perceived them as hapless victims needing paternalistic aid.

Progressive Era: Discovery

Middle-class reformers rallied against sweatshops as part of larger public health efforts. It was believed that sweatshop workers—seen as sickly or potentially sickly—could unknowingly pass disease onto unwitting middle-class consumers through their contact with the garments. Photos of sick children lying on finished garments in tenement shops frightened middle-class mothers across the country. Stories of consumers getting diseases from blankets and clothing added to this fear. To protect middle-class families—and avoid the moral decay of society—middle-class women, without the right to vote but united as consumers, began to demand that the clothing that they bought be "unsweated." In 1891, the Consumers' League of New York was formed, and it created a list of shops that met a certain moral and physical standard and urged women to patronize only these shops. In 1899, the National Consumers League (NCL) was established. The leading figure in the NCL was Florence Kelley, who saw the moral power of consumers unwilling to purchase sweated goods as central to any effort to end sweating. With consumer pressure coupled with labor organization and government regulations, Kelley argued that sweatshops could be relegated to the dustbin of history. She drew on the label campaigns of the cigar workers and other unions to create the "white label"—white, representing, in a radicalized world, purity. The label was given to manufacturers who met the NCL standards. Middle-class women were expected to purchase goods with the white label. Here, Kelley came up with the cornerstone of the modern consumer movement: consumers could do the morally good thing simply by consuming intelligently. At the core of the NCL's rules were the requirements that manufacturers obey state codes, not employ children under sixteen, not engage in homework, and prohibit overtime among others. Historian Eileen Boris has written that, by 1904, only sixty manufacturers earned the label. To highlight the issue, Historian Kathryn Kish Sklar has discovered that the NCL entered into a partnership with John Wanamaker's department store. Wanamaker developed an industrial exhibit on sweatshops in his display windows. Using photos from Lewis Hine, he compared sweatshops to model shops and tried to portray his product lines as reflecting morality and those of his competitors as being morally suspect. Eileen Boris reminds us that these label campaigns "stressed the perils of the consumer rather than the rights of workers." Yet, workers did organize to change the conditions under which they labored.

The garment workers union, the International Ladies' Garment Workers' Union (ILGWU), clearly saw sweatshops as a threat to the health and safety not just of the workers who toiled in them, but of all garment workers as the sweatshop became the competitive norm in the industry, driving all wages and conditions down. In 1909, over 20,000 shirtwaist makers—most of them women—went on strike in New York City over the horrible conditions in the industry. At the heart of their grievances were the horrendous conditions of labor and the contracting system. Immediately, the women reformers within the NCL and those in the Women's Trade Union League aided the strikers and brought much-needed resources and public attention. When the strike ended a few weeks later, the ILGWU had made some real gains as hundreds of shops signed on. But they failed to get an industrywide agreement, and so several of the larger shops remained nonunion. In 1910, a larger strike by the mainly male cloakmakers ended in a revolutionary agreement, the Protocol of Peace. Leading reformers led by noted lawyer and future U.S. Supreme Court Justice Louis Brandeis created a collective bargaining agreement that covered the whole industry in New York City. One of the aims of the agreement, besides the natural bread-and-butter union matters, was a concerted effort to rid the industry of sweatshops through the institution of the union. The Protocol favored larger manufacturers. The union promised increased efficiencies of production in exchange for better wages and conditions and preferential employment of union members. In addition, the union promised to organize the entire industry. Large manufacturers could handle the increased labor costs through efficiencies of production and scale. But small shops could not. Hence, the Protocol was aimed at driving the small shops under. (Actually, it mainly drove them out of New York City to cheaper centers of garment production.) In addition, the Protocol institutionalized a Joint Board of Sanitary

Control that issued certificates and labels for shops that met industry standards.

Another major effort in the anti-sweatshop movement came from the legislative front. These anti-sweatshop activists, however, moved ahead of and beyond the workers they themselves were trying to help. Rather than become true partners with workers and their unions, groups like the NCL sought legislation as a more effective means of stopping sweatshops than unions. As Frances Perkins, an NCL activist and future U.S. secretary of labor, said, "I would rather pass a law than organize a union."

The NCL shifted its focus to legislation shortly after the success of the garment workers' strikes. In 1908, Louis Brandeis wrote a brief for the NCL in the *Muller v. Oregon* case, which upheld maximum hours of work for women. Between 1908 and 1923, when the Court struck down a Washington, D.C., law, seventeen states and U.S. Territories had such laws. By the eve of World War I, the NCL had well over 30,000 members, and there were chapters in many states and in Western Europe.

World War I proved to be a high point of government action. Kelley, leader of the NCL, served on the Board of Control of Labor Standards for Army Clothing. By the start of the United States' involvement in the war, the board issued standards of production that set hours, wages, and health standards. The secretary of war, Newton Baker, himself active in the NCL, along with Kelley and her protégé Amalgamated Clothing Workers of America president Sidney Hillman, attacked the way the army purchased supplies. The government banned sweatshops for army clothing and government contractors. In the end, the government contracts for clothing and the Wilson administration's lukewarm support for labor and "industrial democracy" proved a boon to the garment workers unions and those like Kelley who sought government regulations. To many, the days of the sweatshop were over.

New Deal: Eradication

The Great Depression and the ensuing economic conditions reversed the gains made in the previous years. The NCL continued to demand state involvement but was increasingly looking to the federal government and to a return of an older strategy, labels. These groups pushed the New Deal's efforts to eradicate sweatshops in two arenas: national labor codes and support for the growth of labor unions. The first effort was the National Industrial Recovery Act of 1933, which promoted a larger version of the garment workers' Protocol: tripartite industrial boards. The National Recovery Act (NRA)'s industry boards were to create industry codes. Unlike the private Protocol, these codes had the power of the federal government behind them. In a bow to the NCL's label program, the NRA created the "Blue Eagle" label, which was to be displayed on all products created under NRA codes. Consumers would aid in enforcement of this program by purchasing only goods with the NRA label.

After the Supreme Court declared the NRA unconstitutional in 1935, New Deal reformers pushed through the 1935 National Labor Relations Act (or Wagner Act), which supported the rights of workers to join unions, and the 1938 Fair Labor Standards Act (FLSA). The FSLA was the culmination of Kelley's and the NCL's decades-long efforts to eradicate the sweatshop. Although weak and excluding hundreds of thousands of workers, the national labor standards marked a major advance in the fight against sweatshops.

Many Americans believed that the New Deal legislation and strengthened labor unions put an end to the sweatshop. Reformers and unionists alike declared victory, and World War II and the Cold War shifted the nation's focus elsewhere. The "rediscovery" of the sweatshop in the 1990s was a shock to most Americans who saw it as a relic of the past and representative of Third World nations. Scholar Andrew Ross argues that the sweatshop symbolized an older, undemocratic, and morally suspect industrial age in America. The United States advanced and became more civilized and, therefore, as the influential early-twentieth-century labor economist John Commons believed, thought it had outgrown sweatshops. Their "return," or at least their rediscovery, called into question our very own civilization. What caused the return of the sweatshop? Most experts seem to have bought the argument advanced by the NCL. Historian Landon Storrs, in her recent book *Civilizing Capitalism: The National Consumers' League, Women's Activism, and Labor Standards in the New Deal Era* (2000), has argued that

> reforms initiated in the turn-of-the-century period known as the Progressive Era and consolidated during the New Deal of the 1930s curbed the most egregious abuses of employees in American manufacturing for many decades. In the 1980s and 1990s, however, the weakening of the labor movement, budget cuts for regulatory agencies, and free trade policies blind to labor practices combined to permit a resur-

By the late twentieth century, many *maquilas*, or sweatshops, had sprung up in Central America, such as this one in Guatemala City, Guatemala. *(AP Wide World Photos)*

gence of the sweatshop and to spread its features to other kinds of workplaces.

Yet, it is hard to believe that sweatshops disappeared totally; what seems more likely is that they disappeared from view. Starting in the 1920s, garment shops escaped high labor costs in New York and other unionized cities and relocated in the South, Midwest, and rural Pennsylvania. By the 1950s, with the cheapening cost and increased speed of transportation, manufacturing rushed offshore. By 1997, over 60 percent of all garments in the United States were imported from overseas. Trade agreements such as the Caribbean Basin Initiative, the North American Free Trade Agreement, and the General Agreement on Tariffs and Trade dropped the barriers for importing.

In an effort to protect their members' jobs, the ILGWU launched a label campaign in 1959 that sought to uphold "the American way of life" and encouraged Americans "to buy American." By the 1990s, the ILGWU had joined manufacturers in the "Made in America" movement. In 1995, with a steep decline in both major garment unions, the ILGWU and the American Clothing and Textile Workers Union (ACTWU) merged to form the Union of Needletrades, Industrial and Textile Employees (UNITE). Soon, UNITE created the Stop Sweatshops Campaign with the NCL.

The 1990s: Rediscovery

In 1995, a raid on a compound in El Monte, California, exposed seventy-two undocumented Thai workers chained to sewing machines and forced to labor for a sweatshop outfit making clothes for Sears and other leading retailers. This only highlighted the growing problem. El Monte sparked a renewed interest in anti-sweatshop activities in the United States.

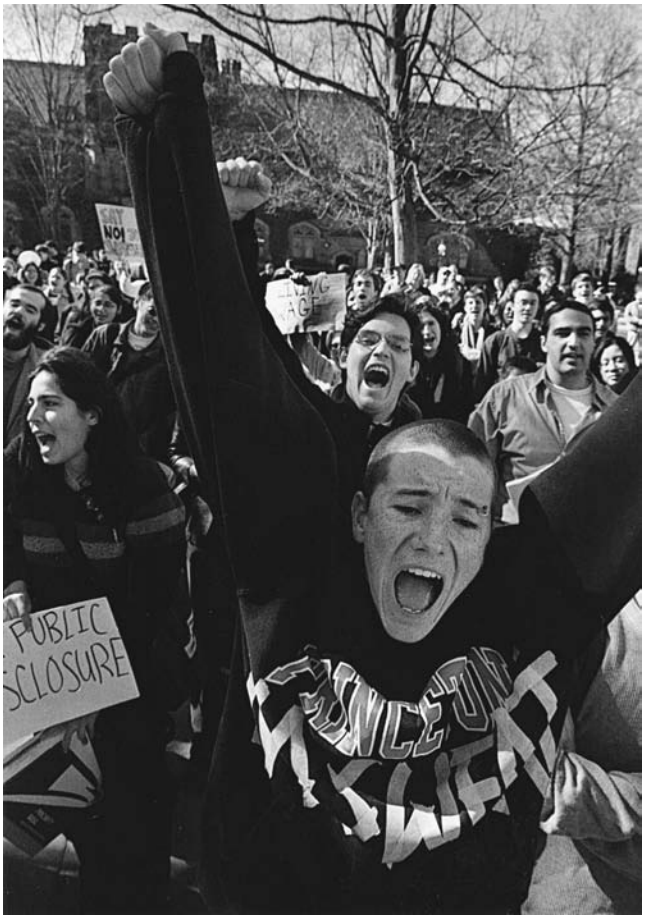
By the 1990s, the anti-sweatshop campaign moved beyond the "Made in America" label—which tells us little about where and under what conditions

On March 16, 1998, masked workers protest against television personality Kathie Lee Gifford, whose line of clothing was being manufactured by sweatshop labor. *(AP Wide World Photos)*

the garments were actually manufactured—toward one of publicity campaigns. The National Labor Committee's (NLC) 1992 report, *Paying to Lose Our Jobs*, showed the support the federal government was offering to U.S. companies to move production to key locations overseas. The NLC turned to brand names such as the Gap. Companies such as the Gap rely on their name to sell. The NLC aimed the media spotlight on them and other companies, such as Liz Claiborne, Eddie Bauer, and J. Crew, exposing the horrible conditions under which their clothing was made. To protect its name, the Gap signed a code of conduct in 1995.

In 1996, Charlie Kernaghan of the NLC testified before Congress and exposed Kathie Lee Gifford's Celebrity Wal-Mart line as being made by child labor in Honduras and in sweatshops in New York. Gifford's upstanding public image made her the perfect foil for the anti-sweatshop movement. Within a few weeks, Gifford was won over and in an effort to remove the tarnish from her name joined the secretary of labor's fashion industry summit in the summer of 1996. Within a short time, the NLC was joined by several other groups: Sweatshop Watch and Students Against Sweatshops among others. With the U.S. Department of Labor (DOL), student groups, consumer groups, and labor unions, retailers sought to form their own group, if only to protect themselves. By 1997, a Presidential Taskforce was created (Apparel Industry Partnership, or AIP) and agreed on codes of conduct.

The DOL issued a "No Sweat" label of its own. The NLC joined with the AIP, which many saw as



At a rally at Princeton University on February 16, 1999, freshman John Kimble—with the words "No Sweat" taped onto his sweatshirt—and fellow students protest the use of sweatshop labor to make university garments. *(AP Wide World Photos)*

being too weak and too pro-company. This compromise angered trade unions and religious and human rights activists who denounced the NLC. UNITE dropped out of AIP in 1998 because of its failure to support workers' rights. In an effort to save itself, AIP offered a seat on its fourteen-member board to a representative of colleges and universities. Colleges and universities licensed the manufacturing of clothing and apparel with the institutional logo.

In March 1998, Students Against Sweatshops forced Duke University to sign the first code of conduct that openly and explicitly supported the rights of workers to join unions. By the summer of 1998, United Students Against Sweatshops had chapters on dozens of campuses across the nation. Students conducted a number of "sleep-ins" across the nation to force their administrations to join their own monitoring group, the Workers' Rights Consortium. These efforts and those of unionists forced cities across the nation to sign codes of conduct of their own as well as anti-sweating ordinances.

The current anti-sweatshop movement has moved beyond the reform model first adopted by the NCL during the Progressive Era and has embraced workers' rights and solidarity. The challenge for activists now is that as clothing and much else Americans consume have moved overseas and increasingly to undemocratic nations, how do they help these workers to improve their lives? The anti-sweatshop movement now sees itself as an ally of workers, providing them with the means to help themselves. The movement has united with human rights groups, religious groups, environmentalists, trade unions, fair trade groups, and others to form a new political force that plays a role in world politics. The future success of this movement will depend on these newly forged linkages between these organizations.

Fair Trade Coffee Campaign

Nonprofit Fair Trade–certifying organizations have altered coffee's path from farmer to consumer by making it possible for farmers to form cooperatives to process and market their own beans. Their aims are to ensure that farmers are paid a living wage for their produce, to provide access to affordable credit, and to promote practices that are sustainable for workers and the environment. The movement has linked consumer activists, farmers, environmentalists, development agencies, and industry leaders—many of whom see coffee as one of the world's most powerful tools for social change.

As an export commodity, coffee is second only to petroleum. Two species within the Genus *Coffea* account for virtually all coffee traded. *Coffea arabica* is the original coffee, native to the highlands of Ethiopia. It now provides about three quarters of the world coffee supply. *Coffea canephora* (known familiarly as robusta) originated in the lowland forests of West Africa. It did not enter the commercial market until after World War II, as a low-grade filler used in blends.

C. arabica, the tastier species, typically grows at higher altitudes than robusta and is more susceptible to poor soils and diseases. It thus commands a higher price but is equally vulnerable to price competition since much of it ends up as a flavor component in canned coffee blends. Among arabicas, cup quality reflects growing and harvesting conditions (e.g., altitude, soil quality, weather) as well as the way the coffee cherries are processed to yield green (unroasted) coffee beans for market. The highest-quality arabica beans go to high-end "specialty" roasters. These companies compete on the bases of quality and product differentiation (e.g., a coffee's origin and the style in which it is roasted) much more than price. In the United States, the largest coffee-consuming nation in the world, specialty coffee accounts for about 40 percent of by-the-cup sales and 17 percent of overall coffee sales. Mostly as a result of Fair Traders' and other activists' efforts, the specialty industry has moved to differentiate itself on the basis of "total quality" coffee. This definition incorporates social responsibility and environmental sustainability as well as excellence in the cup.

The Coffee Crisis

Figure 1 illustrates a typical route via which coffee beans travel from the grower to the consumer. Almost all coffee is exported in green bean (unroasted) form. The export price of arabica coffee is fixed, relative to its cup quality, as a differential in relation to the New York Coffee Exchange. The coffee futures contract traded on the New York exchange is the "C" contract for Central American arabica coffees. Until the 1980s, the major participants in coffee futures trading were importers and roasters, who used it mainly for protecting themselves against sudden price changes. More recently, speculation by large mutual funds has contributed to wild fluctuations in coffee prices. Figure 2 shows fluctuation in the "C" since 1960. In the 1990s, the spot price for arabica coffee was as low as $0.48/pound and as high as $2.71/pound. In autumn 2001, it plunged to $0.45/pound.

The price paid to coffee farmers and exporters is typically pegged to this volatile spot price, a situation that many call the "tyranny of the 'C'." Oversupply of coffee on world markets is at the root of the price decline. Since 1990, coffee production worldwide has increased by 15 percent, whereas consumption has increased only about 7 percent. The increase in production has resulted directly from a decline of regulation of the industry. The demise of the International Coffee Organization (ICO) in 1989 brought an increase in competition and in production. This led to overplanting new trees, as well as new entrants in the market—notably Vietnam. Although the new coffee is of low quality and does not interest specialty buyers, the

entire market is affected by the glut. Unless the worldwide coffee industry as a whole drastically changes the way it does business, analysts expect the oversupply to last for at least five years.

The situation of the peasant farming families who produce over half the world's coffee supply is characterized by extremely limited access to land, financial resources, and political power. Small farmers now earn less than $600 per year—not enough to purchase much food or send their children to school, let alone invest in machinery to process their coffee or transport it to market. They are forced to sell to local intermediaries, at prices well below the "C." Others process the coffee, which then goes to exporters, whose success is determined by their ability to match suitable products with specific brokers and importers. The farmers often receive less than the cost of production, and their only financial credit is their future harvests.

Lots of coffee is also grown on large plantations worked by landless day laborers, many of whose plight is worse than that described above. The primary focus of the Fair Trade coffee movement, however, is on small farmers who cannot continue to produce at a loss. Unless they are already integrated into the high end of the specialty niche as "preferred providers" for roasters that pay top dollar for top quality (such as Allegro and Starbucks), these farmers have few, if any, incentives to grow high-quality coffee and cannot compete with other producers of low-quality coffee. Activist groups are making this situation visible to the coffee-consuming public and are trying to change it.

Ethical Consumption and Fair Trade

The Fair Trade Coffee campaign is part of a phenomenon best labeled "ethical consumption," in which the purchasing power of consumers is used to promote a goal that serves the interests of others. Since the pressure is largely applied by individual consumers, coffee roasters and retailers are responding to aggregated economic demand as well as, if not more than, political demand. The ethical consumption movement started with the emergence of Alternative Trade Organizations (ATOs) such as Ten Thousand Villages (1946), Fair Trade Organisatie (1967), and Global Exchange (1988). ATOs originally aimed to create a parallel system that would open markets to disadvantaged Southern producers rather than to reform conventional trading practices. The U.S. ATO Equal Exchange began in 1986 by importing coffee from Nicaragua to express solidarity with the Nicaraguan people after the Reagan administration imposed a commercial embargo. Equal Exchange has since built a small niche for Fair Trade coffee in the United States.

The first Fair Trade certification initiative was Max Havelaar, launched in the Netherlands in 1988. This was an important departure from the ATO model of selling products in small Fair Trade shops or via mail order. The Max Havelaar Fair Trade seal was offered to mainstream coffee companies if they agreed to buy some—even a small fraction—of their coffee on Fair Trade terms. By paying a certification fee, roasters could purchase the right to apply the seal to an amount of their roasted coffee equivalent to the amount of Fair Trade coffee they purchased.

Max Havelaar's strategy of targeting larger, profit-driven roasters and getting Fair Trade coffee into supermarkets gave many more consumers exposure and access to it. In a relatively short time, Fair Trade labeling became established as a viable market concept. Labeling organizations under the name Max Havelaar spread to Belgium in 1990, Switzerland in 1992, Denmark in 1994, France in 1992, and Norway in 1998. Other groups adopted the concept under different names. These include Rattivsemarkt of Sweden, Reilon Kaupan Edistamisthdistys of Finland, the Fairtrade Foundation of London, Fairtrade Mark of Ireland, and TransFair of Germany, Luxemburg, Italy, Japan, and, more recently (in 1996), the United States. All of these organizations monitor the coffee production and administrative practices of farming cooperatives that seek to sell on Fair Trade terms. Importers and roasters pay the cost of monitoring and certification. Certifiers are essentially middlemen too, but are operating under a set of incentives very different from that of brokers in the usual market.

Since 1997, Fair Trade certification initiatives have been united under the umbrella of the Fairtrade Labelling Organizations (FLO) International, an umbrella group working to standardize the certification process for a wide range of products. FLO maintains a Fair Trade Register of producer groups approved to sell to the Fair Trade market. In May 2001, it listed 363 groups from twenty-two countries. The majority is in the Western Hemisphere, but cooperatives in Cameroon, the Democratic Republic of Congo, Papua-New Guinea, Tanzania, Uganda, Ethiopia, Indonesia, and Thailand are also on the list.

The internationally accepted criteria for Fair Trade coffee are:

1. Purchase directly from small farmers organized into democratically managed cooperatives.

2. Guarantee a floor price when market prices are low.
3. Offer farmers credit (an obligation of the importer).
4. Develop long-term relationships between importers and farmer cooperatives.

Figure 3 illustrates the shorter, Fair Trade route to market. By focusing on cooperatives, the Fair Trade movement creates an incentive for small farmers to organize their own processing and marketing operations. At present, the Fair Trade floor price for washed arabica coffee is $1.26/pound ($1.41/pound if the coffee is also certified organic). When the market price is above the floor price, the Fair Trade price is $0.05/pound higher. Floor prices were established in 1988, after considerable field research and several rounds of negotiations among representatives of the Fair Trade movement, farmers, and the coffee industry. They have been raised once since then.

Advocates for Fair Trade certification are convinced that theirs is a model for the future, reflecting consumers' and stockholders' desire for businesses to be socially responsible as well as profitable. Certification has already improved the lives of more than half a million coffee farmers, and Fair Trade organizations' efforts have raised customer demand for Fair Trade coffee to an all-time high. Still, Fair Trade certified beans account for less than 2 percent of the world coffee market. Existing cooperatives are able to sell less than half of their crops at the established Fair Trade price. The campaign has necessarily shifted its focus from organizing farmers to expanding the market for their product by increasing consumer demand. Will the strategies that have built the current Fair Trade market foster its continued expansion? The next sections review these strategies, and raise challenges and opportunities facing Fair Traders now.

Figure 3. The Fair Trade Route from Tree to Cup

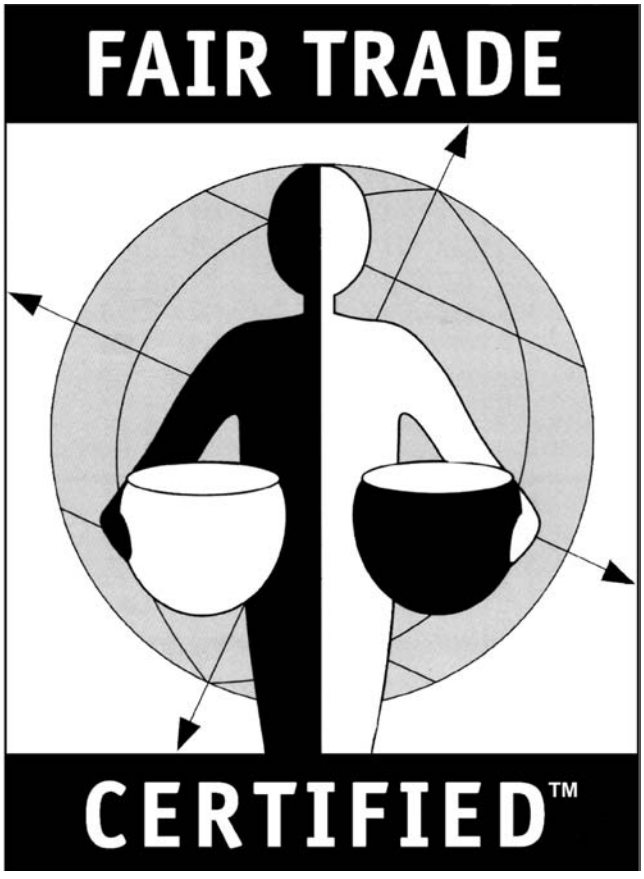
Making a Fair Trade Market

The Fair Trade coffee movement seeks to make a lasting impact on society's social values rather than to make a profit. Its goals and interests contradict those of the other players in the industry and can produce contention with them. Hillary Abell, development director of TransFair USA, said in a 2001 interview that "norm change" was its number one goal and would be achieved by making "the Fair Trade model as normal, unintentional, and universal as nondiscrimination and basic environmental responsibility are today." Although Fair Traders do offer a tangible market product, what they are essentially trying to sell is the norm that people in prosperous countries should factor global social justice into their buying decisions. Certifying organizations and other groups attempt to do this by raising public awareness of Fair Trade issues; inciting consumer demand; and encouraging roasters, retailers, and restaurants to offer a Fair Trade product.

College campuses, churches, and companies that already have a commitment to corporate social responsibility were logical targets for the first efforts to reach a sympathetic, social action–oriented audience. An example is Global Exchange's successful campaign to get Starbucks to introduce a Fair Trade blend. In October 2001, Starbucks promised to buy a million pounds of Fair Trade coffee in the next twelve to eighteen months. Global Exchange sees this outcome as "an important win for the corporate accountability movement" as well as a way to bring the Fair Trade message to millions of consumers. Starbucks now has a Department of Corporate Social Responsibility, which issues an annual report and attempts to be responsive to consumers and the more general public. The company seems committed to maintaining Fair Trade certified coffee in its lineup, and has begun working with at least one Fair Trade coffee cooperative, the Promoter of Cooperative Development in the Segovias (PRODECOOP) in Nicaragua, to help them produce more coffee that the company will buy. Starbucks has recently signed a Memorandum of Understanding with FLO International. This will enable the company to enter into licensing agreements with national Fair Trade organizations to sell Fair Trade Certified coffee in the countries where Starbucks does business.

Seattle-based chains Tully's and Seattle's Best Coffee (SBC) and San Francisco–based Peet's Coffee be-



The Fair Trade Certified label signifies that farmers and workers were paid a fair price for their products. *(www.transfairusa.org)*

gan to offer Fair Trade coffee shortly after Starbucks did. In fact, Tully's was planning to introduce its triple-certified (Fair Trade, organic, and shade-grown) "Compadre Blend" before Global Exchange launched the Starbucks campaign. Both SBC and Tully's have produced pamphlets and special packaging to educate consumers about Fair Trade and other sustainability issues. These and other specialty coffee companies have recognized that offering sustainable coffee is essential to remaining competitive.

Quality is implied (or assumed) in the Fair Trade message, but it has not been an explicit part of the campaign. Yet, while doing the right thing may be the primary motivation for some coffee purchasers, quality usually trumps all else. Seattle representatives of the natural foods grocery chains Puget Consumers Cooperative (PCC) and Whole Foods report that, while their customers are among the most likely to ask for and purchase Fair Trade products, buyers' decisions to stock Fair Trade coffees and customers' decisions to buy them are based as much on good taste in the cup as on a desire to help coffee farmers. A recent survey of coffee consumers conducted by TransFair USA also showed that taste is the most important factor in coffee-purchasing behavior. *Assuming high quality*, half the respondents said they would buy Fair Trade certified coffee and pay $1.00 to $2.00 per pound more for it.

Further interviews with coffee roasters and retailers show that customer demand is nearly as important as quality when it comes to a business's coffee-buying decisions. Verbal pressure for Fair Trade coffee is the first step, but it must be reinforced by economic demand, that is, actual purchases. Where a business and a public have not been the targets of campaigns, Fair Trade coffee is usually not available, and no one is asking for it. This suggests that Fair Traders working to expand the U.S. market should continue to focus on getting consumers' attention and educating them about the issues and getting roasters, retailers, and restaurants that already buy Fair Trade coffee to advertise their purchase. In addition, the movement should do more to target institutional consumers such as airlines, hospitals, corporations, and government agencies. An emphasis on quality must be integral to these approaches.

Competition Within the Sustainability Movement

Fair Traders have piqued the specialty coffee industry's attention, but so have other "issue" coffees. Sustainable coffee has become the umbrella term that includes organic and shade-grown (and therefore protective of bird life) coffee production as well as Fair Trade. Groups organized around various coffee-related issues do network with each other and are generally supportive of each other's principal cause. Nonetheless, the existence of multiple products all targeting virtually the same ethical consumers is confusing and could potentially undercut the market for each.

Advocates for the various organizations agree that the nature of the technology used by small farmers is such that most of the coffee they grow is, in fact, organic and shade-grown. The farmers cannot afford the chemical fertilizers and machines that endanger the earth or birds. By and large, they use traditional methods that, as a by-product, protect the environment. No certifying agency claims to represent a mutually exclusive situation where only coffees with a particular seal are protecting the environment, ensuring the existence of a bird habitat, or guaranteeing the

sustenance of small farmers. Certification campaigns attract media attention and help people see the connection between their daily beverage and the producing country. Many suppliers have sought multiple certifications. Sustainable Harvest in Emeryville, California, was the first importer to be accredited to sell coffees that are certified organic, shade-grown, and Fair Trade. Thanksgiving Coffee Company, based in Fort Bragg, California, developed a point system that incorporates criteria from all three. Perhaps the market will eventually decide which seal consumers believe to be the most important and useful.

Other industry players are serious about sustainability but are convinced that certification campaigns are the wrong way to pursue it. According to Kevin Knox, the green coffee buyer for Allegro Coffee Company, the company has "attempted to chart a course dictated not by would-be issue mongers, but by an understanding of the needs of Allegro's customers and suppliers." Paying farmers a fair price is essential to ensuring sustainability. Knox also notes that the best beans are already produced in an environmentally sound way and already fetch premium prices. He maintains that no coffee is sustainably produced if it is not, first and foremost, a great-tasting coffee; otherwise, it will have an insufficient market.

The Future of Fair Trade

The long-term challenge to Fair Trade is to reach the nonspecialty or regular coffee producers and drinkers. As long as coffee is overproduced and many consumers do not care about the quality of the coffee they drink, most of the world's coffee farmers and workers will not be able to make a living wage. Changing taste preferences and educating consumers to be willing to pay more for a better product is feasible but not easy. There is a long way to go before canned coffee brands, produced and picked by poverty-level laborers, will become unprofitable for the transnational corporations that own them. Slow and steady progress has been made, largely generated by the creation of specialty coffee. The next step is harder. Fair Trade has to move beyond the public that is easiest to persuade to become ethical consumers. Even most of them, as we have seen, still purchase based on quality first but prefer the combination of quality and ethics. To reach a broader public requires a strategy that will ensure that ethics comes at a price they are willing to pay.

Consumer preferences are generally sticky and unlikely to change without some external intervention. Just as Fair Traders have been wise to target institutions as well as individuals, the specialty industry's voluntary self-regulation needs to be supported and expanded by governments. Sustainable coffee will gain the world market advantage only when all coffee producers and roasters are required to meet environmental and social standards.
